On the British side it is asked: Is it desirable to let foreigners get a big hold on our plantations? In the ordinary way the answer would be no, but in a case where it is necessary to sell, then America is the place to which to look for good prices. In fact, in the present condition of world politics, it is the only place to look to, seeing that Germany does not count, and that other allied nations have no spare capital to invest in foreign ventures. Then, from the point of view of the general interest of the country itself, any development of the land is to be welcomed. There are thousands and thousands of acres of rich land awaiting development, and only outside assistance can make this possible as it is obvious that for years after war is over the burden of taxation will prevent a large volume of British capital being available for colonial purposes. It is not likely that in such circumstances Britain will run the risk of detriment to the territories under her care by raising obstacles to foreign capital. Without help the colonies will decline, but by accepting it both Great Britain and those who assist will benefit. From all points of view, then, the promised "American invasion" of Malaya is to be heartily welcomed.

Recent company reports indicate that, while practically all estates are showing steady and substantial profits, directors are being more cautious than ever in the matter of making large allocations to reserve. It is expected that war taxes on profits are to be made heavier still, and when the pressure of war conditions is becoming heavier every day, companies have to be prepared for almost any calls. As regards the thriving nature of the industry, nothing is more significant than the way in

which cocoanut companies are abandoning that product in favor of rubber. Only three or four years ago there was great talk of a boom in cocoanuts, a boom that was to outrival that in rubber of a few years previous. "The consols of the East" was one expressive phrase used to describe the new industry, and a good deal of money was put into cocoanut estates in various parts of the peninsula. But the boom has not eventuated. For some reason cocoanut cultivation does not prove a general success. Various causes hinder the development of estates, and speculators are finding that they will have to wait a long time for the big profits promised. So now rubber trees are replacing cocoanut trees in a good many cases.

ANOTHER VIEW OF THE AMERICAN INVASION.

ALL rubber men do not hold the opinion of the correspondent of THE INDIA RUBBER WORLD on this matter, however. Discussing the tendency of the "wise men of the West" to acquire land on British soil in Malaya—and plant rubber in competition with British planters already established there, our English contemporary "Tropical Life" states the drawbacks of such a tendency from the point of view of many British planters.

Firstly, it would further increase the output of raw rubber by outsiders, who cannot do so well elsewhere, when we British planters are already threatened with a surplus in the near future as it is. Secondly, as the manufacturers are at the back of the move, they can only be after producing their own supplies, or a portion of them, thereby reducing their competition for our output.

Regarding the viewpoint of the American manufacturer who is striving to protect himself from the raids in the form of rubber booms made upon his legitimate business, our English contemporary continues:

But how is the American manufacturer proposing to protect his interests? Is it not at the expense of our own by coming to British Malaya to plant rubber against our own planters after having watched them all these years risking and losing money, health and even lives in establishing the industry and showing how it can be carried on with safety to pocket and person.

Lastly, but most important of all, there is the question of native labor supplies. From what source will the Americans draw their requirements; from British India and elsewhere within our Empire, when the great question of the day is to know how the British-owned estates, sugar, cacao, etc., will do five or ten years hence, when India keeps her labor to herself and our own areas have been largely increased as they must be if the world is not to run short?

We have no feelings but those of good will towards our American cousins, so long as they are not hyphenated ones; but knowing as we do what a large proportion of German blood there is in the so-called American hustlers now overflowing into the world. South America, British territory and elsewhere, we feel, therefore, before we set up and allow outsiders to grow fat at our expense, now *we* have proved that *they* can do so, that we ought first to consider what harm can befall our planters by doing so; and secondly, and above all, let us analyze the constitution of the companies and of the syndicates that are proposing to invade and exploit British Malaya at our cost. The wisdom of allowing genuine Anglo-Saxon Americans to settle in Malaya is doubtful, but it would be worse than wicked to feed Germany and Austria through the United States, as we may do by such an action. Even from the competitive point of view it would be bad to take the backbone out of the New York orders by allowing American manufacturers to settle in British territory to produce a portion of their supplies; but if, hidden behind the cosmopolitan back of Uncle Sam, we must feed Germany and Austria as well and spoil their future demand for our plantation rubber also, it would not only be wicked, but downright suicidal for British interests won at so much cost to British subjects.

As already said, we have nothing but good will towards the genuine inhabitants of the United States, who, we know, are well disposed towards us. Even in their case, however, we believe in the saying that "Charity begins at home," and as America is so extremely wealthy, Uncle Sam can well afford to continue to buy our rubber, as he has been doing, instead of coming in to produce rubber to reduce his competition as a buyer in the world's markets.

FIGHTING THE LEAF DISEASE IN DUTCH GUIANA.

IN his report on the South American leaf disease (as briefed in THE INDIA RUBBER WORLD, September 1, 1916, page 689), Mr. Bancroft recommends spraying with a solution of sulphate of copper in lime water. He also advocates the destruction, by burying or burning, of all fallen leaves.

A preliminary report of Dr. G. Stahel, Government Mycologist of Dutch Guiana, has been made which takes a somewhat dissimilar view of the efficacy of spraying, and recommends radically different treatment for eradicating the disease.

Dr. Stahel has completed his investigations, but the Board of Agriculture is delaying the full report until drawings and photographs, which are to be reproduced in Holland, are available. However, the preliminary report has been published in order that practical work may not be further delayed. This report is as follows:

The disease is attributable to a fungus of three fructifications. The main fructification, *i. e.*, the perithicium, is found on the old leaves, in one to two months at its earliest and before they are matured.

The pycnidium fructifications are always observable on the matured leaves; after two months the perithicium always predominates and is always to be found on the leaves.

The scoliotrichum conidium buds in water in about two hours; if sowed on young leaves, it will be found that after ten hours, a large percentage of the germ-tubes collect under the cuticle, and after 20 hours they will penetrate between the epidermis cells into the leaves and branches.

Drying the conidium, they will die out after 15 hours. The pycnospores bud in water and in nourishing solution, after a few hours, but the general germ-cell does not exceed two to three micron in length.

Sowed on very young leaves, the germ-cell will not develop further.

The ascospores bud in about the same period as the scoliotrichum-conidium sowed on young leaves. It will be found under the cuticle after 12 hours, very few, single and short germ cells, but after 20 to 22 hours these germ cells will be found far thinner than the scoliotrichum, although grown a little further under the cuticle, but not penetrated in the leaves between the epidermis cell; if the spores are dried out they die in a few hours. The production, however, of ascospores is further very limited, even when the leaves are well supplied with much perithicia, but few on some of the trees that I could obtain for my investigation.

The ascospores will, therefore, contribute very little in spreading the disease. The matured leaves, which so far only bear perithicia are consequently not very dangerous.

It is, however, with the young and matured leaves quite different; these produce a large quantity of scolico. We have found in *Hevea* fields trees that were withering during the whole year, or trees which were forming young sprouts invested with scoliotrichum fructifications. In view of these facts we have come to the following conclusions:

Care should be taken during three to four weeks that the cultivations be kept free from all young *Hevea* leaves, and it will be found that all scoliotrichum fructifications will disappear and also the conidium within 24 hours. The scoliotrichum fructifications will appear again, however, at a later period, and will spread, if the ascospores be not effectively made harmless. It will be necessary, therefore, from time to time to repeat the treatment; but experience will teach in the interval between each treatment.

It is obvious in these treatments that the neighboring plantations follow suit, or in the event of unwillingness on the part of the neighbors to do so the *Hevea* trees should then be removed from the fields.

As the leaves of the *Hevea* always form in a cluster from, say, eight to ten, close upon each other, at the end of the branches, they can be cut off very easily with the aid of a cocoa knife, which is to be highly recommended.

For instance, during the dry season, when the latex is not flowing sufficiently, the laborers can be divided for a few weeks and put to work in the *Hevea* fields to destroy all the young leaves, especially at certain times, when only small portions of the trees are wintering or producing new sprouts. A laborer can treat two large or three small ones in a day of eight hours.

Whether this mode of fighting the disease in Dutch Guiana will prove effectual if continued is hard to say, or whether it

would be better to substitute the *Hevea* in the coffee fields by coffeemama trees I refrain from discussing.

Until recently I have overvalued the significance of ascospores for spreading the disease; only by the latest investigations during the last two months it has proven to me that the infective power of the ascospores can be insignificant, and only in view of these results could I recommend a method which, to my idea, will prove technically adequate.

A few weeks back an article appeared in one of the local papers to the effect that in British Guiana something had been effected towards the eradicating of the disease, and in consequence I am obliged to mention something in connection with the system employed in that colony.

It is recommended by the Government botanist in that colony that spraying the young leaves with Bordeaux mixture and cutting off the dried branches from the healthy parts and destroying the fallen leaves will be found to help remove the disease; to this I will say dead fungus does not do any harm. But the cutting of the dry branches from the healthy part is based on the fact of my investigation and which I cannot even recommend. I have, therefore, advised a few plantation owners where the system has been carried on not to continue it; the reason of this will appear in the Bulletin.

Spraying of the trees with Bordeaux mixture will, when applied on leaves two to four days old prove favorable, but the application appears to me for various reasons to be unfit; in the first place, it is expensive and not so beneficial as my proposed method.

Proofs are also shown here that the young leaves of one to three centimeters cannot bear the spraying with Bordeaux mixture, and will curl and fall off. This fact has also been proved on the Sloopwijk plantation during the fighting experiments.

It will thus be seen that these two investigators are widely at variance regarding the methods necessary to overcome this disease. However, we understand that Mr. Bancroft has not yet completed his investigation, and moreover, has since made a visit to Dr. Stahel to consult with him regarding this important matter. It is hoped that as a result of this meeting conclusions will be reached which will be of such character as to provide rubber growers throughout the world with a remedy for this formidable disease.

CRUDE RUBBER IN HONDURAS.

According to the American Consul at Ceiba, Honduras, the crude rubber industry there is dormant. The low prices prevailing in rubber markets, coupled with the export duty levied by the Government of Honduras and the municipalities, amounting at Cuba to approximately 4 cents gold per pound, makes rubber gathering so unprofitable that the natives will not tap the trees even when they can find them close at hand, and traders declare that they buy the product merely as an accommodation.

RUBBER TRADE OF BOLIVIA IN 1915.

According to the statement of the Bolivian Minister of Finance to the 1916 National Congress of Bolivia, the exports of crude rubber, which amounted to 4,484,915 kilograms [9,867,813 pounds] in 1914, reached 5,034,847 kilograms [11,120,663 pounds] during the fiscal year 1915-16.

RUBBER GOODS IMPORTS INTO VENEZUELA.

The American Consul at Maracaibo reports the following imports of rubber manufactures into Venezuela during the years 1914 and 1915:

From—	Tires.		All other rubber goods,	
	1914.	1915.	1914.	1915.
United States	\$1,720	\$5,600	\$1,320	\$3,152
United Kingdom	490	1,200
Germany	1,960
All countries	\$1,720	\$5,600	\$3,770	\$4,352

CONSULAR INVOICES FOR BRAZILIAN SHIPMENT.

The Brazilian budget law for 1917 provides that no invoices after shipment will be accepted by Brazilian consuls, and shipments unaccompanied by consular invoice pay double duty.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED DECEMBER 19, 1916

- N**O. 1,208,772. Heelless overshoe. C. S. Goodyear, Naugatuck, assignor to The L. Candee & Co., New Haven—both in Connecticut.
- 1,208,869. Rubber-coated closet seat. M. J. Whelan, Muskegon, Mich., assignor to Brunswick-Balke-Collender Co., a corporation of Delaware.
- 1,208,902. Elastic tire. H. E. Boyd, Akron, Ohio.
- 1,208,906. Inner tube for pneumatic tires. J. P. Brophy, Birmingham, Ala.
- 1,208,922. Drenching bottle entirely constructed of rubber. G. Dawkins, Truxno, La.
- 1,208,932. Demountable rim. R. A. Eckberg, Des Moines, Iowa.
- 1,208,946. Tire filler. L. G. Gilchrist, Vandergrift, Pa.
- 1,208,948. Spring tire with rubber shoe. G. Greco, Pittsburgh, Pa.
- 1,209,042. Pneumatic tire. A. I. Savage, San Diego, Calif.
- 1,209,130. Tire protector. A. Dahl, Yardley, Pa.
- 1,209,206. Vulcanizing fuse. L. Risk, Minneapolis, Minn.
- 1,209,223. Diving dress. H. Stelzner, assignor to the firm of Drägerwerk, Heintz & Bernh. Dräger—both of Lubeck, Germany.
- 1,209,224. Diving helmet. H. Stelzner, assignor to the firm of Drägerwerk, Heintz & Bernh. Dräger—both in Lubeck, Germany.
- 1,209,374. Hose coupling. A. Andreolli, Meadow Lands, Pa.
- 1,209,401. Garter pocket. E. V. Crouse, Chicago, Ill.
- 1,209,442. Doubletread tire. J. F. Jablonski, Irvington, N. J.
- 1,209,509. Demountable rim. F. Spranger and N. M. Spranger, assignors to Spranger Rim and Wheel Co., all of Detroit, Mich.
- 1,209,516. Rubber tooth brush. C. H. Thompson, assignor of one-half to F. H. Wager—both of Troy, N. Y.
- 1,209,575. Cushion tire. N. H. Hassel, Beverly Hills, Calif.
- 1,209,605. Bead for tire casings. T. J. Mell, assignor to the Republic Rubber Co.—both of Youngstown, Ohio.
- 1,209,645. Cord tire. R. B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Ind.

ISSUED DECEMBER 26, 1916.

- 1,209,656. Commode protector comprising an integral rubber ring. S. F. Bailey, North Warren, Pa.
- 1,209,660. Overshoe with elastic cushion at the heel. L. A. Baum, Newark, N. J.
- 1,209,715. Rubber tire and its attachment to wheels. E. B. Killen, London, England.
- 1,209,726. Recoil pad. P. J. Krueger, Blue Island, Ill.
- 1,209,740. Piston packing. C. I. E. Mastin, Midland Park, N. J.
- 1,209,763. Bath mitten. C. A. Rosengren, assignor to The Goodyear's Metallic Rubber Shoe Co.—both of Naugatuck, Conn.
- 1,209,771. Combined sleeping bag and knapsack. R. Skancke, Christiania, and J. F. Aasnes, Selvig, in Sande, Norway.
- 1,209,856. Automobile tire. W. F. Lahey, East Hartford, Conn., assignor of one-third to A. H. Miller, Holyoke, Mass.
- 1,209,978. Self-filling fountain pen. D. J. La France, Somerville, assignor to C. Brandt, Boston—both in Massachusetts.
- 1,209,986. Rubberized sheet for trunk panels and the like. C. D. Mason, assignor to The Goodyear's Metallic Rubber Shoe Co.—both of Naugatuck, Conn.
- 1,210,048. Non-skid pneumatic tire. H. Z. Cobb, Winchester, Mass., assignor to Revere Rubber Co., Providence, R. I.
- 1,210,132. Non-skid tire. J. E. Ash, Athens, Ohio.
- 1,210,155. Tire reliner. J. L. G. Dykes, Chicago, Ill.
- 1,210,219. Sectional tire having inflatable inner segmental tubes. G. Sheely and J. H. Sheely, Marshalltown, Iowa.
- 1,210,273. Packing and method of making same. R. T. Campbell, Kansas City, Mo.
- 1,210,327. Filler for tire casings comprising a mass of horsehair infiltrated with a solution of soft rubber and drained and dried. G. Kelly, Hinsdale, Ill.

ISSUED JANUARY 2, 1917.

- 1,210,466. Petticoat waistband with elastic sections. L. Gutman and B. Gutman, New York City.
- 1,210,538. Air gage for tires. E. B. Rose, Minneapolis, Minn.
- 1,210,575. Joint packing strip. J. F. White, assignor to L. E. White—both of Chicago, Ill.
- 1,210,594. Armor for automobile tires. R. J. Brooks and F. E. Martin, Malvern, Ark.
- 1,210,702. Dust cap for tire valves. A. C. Savage, Indianapolis, Ind.
- 1,210,883. Pasteboard dispensing package for elastic tape. H. A. Austin, assignor to Everlastik, Inc.—both of Boston, Mass.
- 1,210,933. Tread for resilient tires. B. C. Hamm, Boston, Mass.
- 1,210,939. Respirating device. M. Hilgers, Tazewell County, Ill.
- 1,211,005. Tire or casing spreading tool. J. B. Stroud, Pass Christian, Miss.
- 1,211,035. Pneumatic cord tire. C. L. Archer, Minneapolis, Minn.
- 1,211,042. Pneumatic life saving suit. G. Balogh, Detroit, Mich.

- 1,211,055. Elastic arch and ankle support. H. A. Bernstein, New York City.
- 1,211,056. Tire rim. J. M. Berry, Detroit, Mich.
- 1,211,067. Canvas hose couplings. N. B. Braly, Butte, Mont.
- 1,211,192. Tire protector. W. C. Logan, Loudsville, Ga.
- 1,211,214. Tire protector. A. W. Neff, Powell, Ohio, assignor of one-half to G. W. Neff, New York City.
- 1,211,225. Bath brush. A. Pludowski, assignor of one-third to S. Orłowski and one-third to W. Szczepaniak—all of Waterbury, Conn.
- 1,211,245. Valve for pneumatic tires. O. Schutz, New York City.
- 1,211,246. Vaginal syringe. N. C. E. Schwartz, Chicago, Ill.
- 1,211,369. Toy balloon. T. W. Miller, assignor to The Faultless Rubber Co., both of Ashland, Ohio.

ISSUED JANUARY 9, 1917.

- 1,211,387. Device for connecting air hose to pneumatic tire valves. C. W. Beck, Rockville Center, N. Y., assignor to Beck-Frost Corporation, Detroit, Mich.
- 1,211,427. Tire patch. H. B. Ferguson and I. G. Ferguson, Newburgh, N. Y.
- 1,211,466. Air brake hose clamp. C. A. McKeranahan, assignor to The Westinghouse Air Brake Co.—both of Wilmerding, Pa.
- 1,211,501. Tire valve. J. W. Taylor, assignor of two-thirds to G. A. Mohr both of Lansing, Mich.
- 1,211,619. Anti-skid or anti-slip shoe tread. A. J. Oehring, assignor of one-half to A. L. Tucker—both of Chicago, Ill.
- 1,211,642. Automobile top repair patch. H. C. Thompson, assignor to The Hall-Thompson Co.—both of Hartford, Conn.
- 1,211,662. Tire rim tool. R. A. Best, assignor of one-half to G. M. Fish—both of Grand Rapids, Mich.
- 1,211,663. Tire rim tool. R. A. Best, Grand Rapids, Mich.
- 1,211,666. Truss pad of rubber. W. T. Bobo, assignor to The Easy Truss Co.—both of Battle Creek, Mich.
- 1,211,699. Nursing vest. V. Guinzburg, assignor to I. B. Kleinert Rubber Co.—both of New York City.
- 1,211,706. Blanket for offset printing presses and method of making the same. B. W. Hoerbel, Buffalo, N. Y.
- 1,211,769. Tire valve. M. C. Schweinert, West Hoboken, N. J., and H. P. Kraft, Brooklyn, N. Y.
- 1,211,806. Cushioned heel pad for boots and shoes. J. A. Adams, Toronto, Ontario, assignor to E. A. Adams, Montreal, Quebec—both in Canada.
- 1,211,846. Pneumatic bed for hide and leather working machines. H. A. Holder, Lynn, assignor to Holder-Perkins Co., Woburn—both in Massachusetts.
- 1,211,867. Tire patch and the process of making the same. J. G. Moomy, Erie, Pa.
- 1,211,869. Resilient tire. H. A. Naylor, Valparaiso, Chile.
- 1,211,885. Resilient wheel. B. C. Seaton, Nashville, Tenn.
- 1,211,928. Colon-irrigator. A. R. Fisher, New York City.
- 1,211,958. Pneumatic tire shoe. M. C. Overman, New York City.
- 1,212,077. Life preserver. J. W. Lewis, assignor of one-fourth to T. L. Lee—both of Boley, Okla.
- 1,212,084. Cushion tire. E. Mefford, assignor of one-fifth to R. W. Cain—both of Denver, Colo.

ISSUED JANUARY 16, 1917.

- 1,212,297. Fountain-pen. W. A. Welty, Waterloo, Iowa.
- 1,212,313. Brush set in rubber. T. F. Barry, assignor to Rubber & Celluloid Harness Trimming Co.—both of Newark, N. J.
- 1,212,315. Life belt consisting of an endless air tube and casing. S. P. Bjerrre, Chicago, Ill.
- 1,212,379. Quick-acting retainer for demountable rims. C. B. Michel, Oilfields, Calif.
- 1,212,448. Tire guard. O. H. Brown, Ariel, Pa.
- 1,212,558. Automobile tire armor. G. Riddle, Riddle, Idaho.
- 1,212,640. Tire valve. E. A. Hilding, assignor to Aktiebolaget Svenska Luftventiler—both of Lidköping, Sweden.
- 1,212,641. Tire valve. E. A. Hilding, assignor to Aktiebolaget Svenska Luftventiler—both of Lidköping, Sweden.
- 1,212,677. Combined brassiere and girdle. B. Prince and H. Prince, New York City.
- 1,212,744. Fountain-pen. S. S. Crocker, Wollaston, Mass.
- 1,212,819. Nipple. F. S. Sakana, San Francisco, Calif.
- 1,212,834. Sporting shoe having a removable one-piece rubber outer sole.
- 1,212,973. Vehicle tire. W. T. Lupton, and J. M. Lupton, Martinsburg, W. Va., and J. W. Jolliffe, Clear Brook, Va.
- 1,212,985. Shoe sole comprising a cut piled fabric and a rubber compound filling. L. F. Montgomery, Fort Recovery, Ohio.
- 1,213,005. Obstetrical instrument comprising an inflatable pad. A. H. Pillsbury, assignor of one-half to V. Czeskleba—both of Lyndon Station, Wis.
- 1,213,072. Tire armor. C. Campbell, Yonkers, N. Y.
- 1,213,096. Armored pneumatic tire. B. Granville, New York City.

Chemical Patents will be found on page 266. Machinery and Process Patents on pages 270-271.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 6, 1916.]

- 11,879 (1915). India rubber springs. F. Spencer, 77 Canon street, London.
- 11,920 (1915). Tread band for wheel tires. H. W. Barrett, 33 Livingstone Road, Gillingham, Kent.
- 11,931 (1915). Air tube for wheel tires. H. Brown, The Red House, Parkside, Wimbledon Common, Surrey.
- 11,966 (1915). Bed-sore pad consisting of two layers of canvas, netting, etc., with hollow rubber balls between. A. F. E. de St. Dalmas, Tacotena, Lansdown Road, Sidcup, Kent.
- 101,734. Rubber block tire. E. W. Shaw, Oroya Links, Limited, Kalgoolie, Western Australia.
- 101,746. Egg-testing tray employing a perforated rubber covering. J. W. Ferry, of McDowell & Co., Strand Road, London-derry, Ireland.
- 101,772. A device for cleaning and polishing metal comprising a composition block of rubber, emery and carborundum. E. B. Openshaw, 5 St. George's Crescent, Eccles Old Road, Pendleton, Manchester.
- 101,795. Tire attaching means comprising soft rubber facing for tire and metal rim. F. Kuhne, 2 Bautznerstrasse, Dresden, Germany.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 13, 1916.]

- 12,083 (1915). Rim attachment for solid rubber tires. D. Weisenacker, 10 Schildeck-strasse, and F. Cremer, 6 Schildeck-strasse—both in Fulda, Germany.
- 12,087 (1915). Rubber cap to fit over the muzzles of fire-arms to exclude moisture. C. Liddiard, 27 Somerset Road, Frome, Somersetshire.
- 12,180 (1915). Bed rest composed in part of rubber. Meinecke & Co., 66 Park Place, New York City. Assignees of C. W. Meinecke, East Orange, N. J., and D. Hogan, 48 Park Place, New York City—all in U. S. A.
- 12,182 (1915). Gloves with rubber finger tips. P. S. G. Dubash, 135 Highbury New Park, London.
- 12,241 (1915). Tire rim. F. W. Baker, 59 Hagley Road, Stourbridge.
- 12,284 (1915). Waterproof cover for ladies' hats. M. A. F. Haley, 39 Elizabeth street, Park Road, Little Horton, Bradford, Yorkshire.

THE FUTURE RUBBER POSITION.

RUBBER manufacturers may not attach much importance to estimates of the rubber position during the next four years, but forecasts, when made by those who are able to predict with some knowledge of the conditions, are always interesting. In this connection some statistics compiled by a well-known British market authority, with regard to the production and consumption of rubber in the years 1917 to 1920, are given in articles in the London "Stock Exchange Gazette." The authority calls attention to the wonderful expansion in the production of rubber in the last six years. During this period, he points out, the output of Brazil declined to the extent of a few thousand tons, but still amounts to nearly 40,000 tons a year, while the inferior grades of the commodity formerly contributed by Africa have declined from 24,000 tons to about half that figure. Meanwhile, of course, a remarkable expansion has taken place in the plantation output. In 1905 this amounted to a total of only 145 tons; for the year just ended the total was something between 140,000 and 150,000 tons—say, one thousand times the crop of eleven years ago. In fact very nearly three-fourth of the world's crop is now derived from plantation sources. It was feared, he says, that over-production must result from the great planting boom of 1910 and 1911, during which period some 360,000 acres of land were placed under cultivation. Although these areas are now reaching maturity, so far there has not been the slightest sign of over-production; indeed, it is doubtful if the world's crop expected after 1919 will be sufficient to keep pace with the wonderful demand.

Summarizing the results of his investigations, the authority referred to puts forward the following estimates of the world's probable production and consumption of rubber in the next four years. In these estimates no allowance was made for the German and Austrian post-bellum demand of about 20,000 tons a year. Estimated total production in 1917, 235,000 tons; in 1918, 265,000 tons; in 1919, 295,000 tons; in 1920, 314,000 tons. Estimated consumption, 1917, 230,000 tons; in 1918, 260,000 tons; in 1919, 290,000 tons; in 1920, 312,000 tons. Quite apart from future requirements of the central European powers, it would appear that during the whole period supply and demand are expected to remain very nearly balanced. On peace being declared it seems not unlikely, therefore, that a shortage in supplies will be created. It remains to be seen whether even the immense areas now under cultivation in the middle east will produce sufficient rubber fully to satisfy the world's increasing demands up to 1920.

Crude Rubber During 1916.

THE crude rubber market for the year opened with the November advance still continuing. On January 4 the high mark was reached with First latex crêpe, spot, selling at \$1.05, and Upriver fine, spot, at \$1, prices which had not been equaled since the spectacular advance in August, 1914. Small stocks were responsible for the firm tone in Upriver fine, but otherwise the market was purely speculative, due to the uncertainty of arrivals. January imports at New York, however, reached 9,400 tons, the largest monthly receipts since March and April, 1915, so that on February 1, First latex and Smoked sheet had dropped to 76 cents, and Upriver fine to 73 cents.

Imports were smaller during February, and consumers were interested only in immediate requirements. Forward deliveries were uncertain, due to lack of cargo space and slow shipment. Values, however, ranged upward, reflecting the generally firm London market until on February 29 First latex, spot, was quoted at 93 to 94 cents, and Upriver fine 77 to 78 cents. Contrary to custom, London futures were at a premium over spot rubber, indicating that lack of adequate shipping facilities constantly threaten the rubber market.

March trading was steady, but comparatively small. New York arrivals showed increasing volume, and shipments of plantation rubber from the Far East by way of the Pacific Coast became more frequent. This route is slow, chiefly because of railway car shortage in America, but the war zone and its perils, also the eastern freight congestion, are avoided thereby, and consequent high cargo and insurance rates. Minor fluctuations netted a decline of 2 to 3 cents during the month.

Direct shipments to America from the Far East by way of the Pacific Coast continued in large volume during April, 5,810,127 pounds being reported as having arrived by that route. Trading was slight, and on April 25 First latex, spot, had declined to 80 cents, Smoked sheet ribbed to 79 cents, and Upriver fine to 71 cents.

May prices still sought lower levels. Apathetic trading reflected the dull tone of the London market. Because of backward spring weather the anticipated tire business did not develop, and manufacturers still had a large accumulated stock. Imports considerably exceeded the previous month, and holders of crude rubber were reluctant to accept orders under the market. Futures higher than spot rubber in New York, with the opposite prevailing in London, was a strange anomaly, reversing the February situation. On May 29 First latex, spot, had reached 67 cents, Upriver fine, spot, 66, a decline of 10 and 3 cents respectively, within four weeks.

June brought only the usual desultory trading. Upriver fine, spot, had reached the low mark, 65 cents, June 1, and prices generally continued to decline, although on June 15 Upriver fine was selling at 2 cents premium over First latex. Speculative interests, however, brought the market up on June 28 to 67 cents for Upriver fine, spot, and 61 cents for First latex, spot.

Then followed four months of comparative stagnation unusual in the history of the trade. Minor fluctuations were in response to the London market. Imports continued heavy, a new record of 800 tons being established at San Francisco in July. Trading was extremely dull, sales being made in August at less than ruling prices when First latex, spot, reached its low mark of 56½ cents. Throughout this period Upriver fine took the lead in demand and price. New shipments were delayed by abnormally low water on the Amazon; stocks were scant, and heavy Russian buying still further depleted them

and advanced the price. Spot quotations in September fluctuated from 70 to 75 cents.

It was expected that the increased sale of rubber goods in October would bring an active covering of crude rubber requirements, and lower prices were indicated by reassuring reports of increased production. But the buying movement did not develop; imports were small and the trend of prices took an upward turn. The temporary fright occasioned by nearby German submarine operations sent prices up 3 to 5 cents on October 9, and although they partially subsided later, Upriver fine was quoted at 81 cents on October 30, First latex, 63½ cents.

This general upward trend in the market continued throughout the year. All grades of crude rubber were in good demand and toward the end of November trading became quite lively, with

— Upriver Fine First Latex Crêpe.

CHART SHOWING FLUCTUATIONS IN PARA AND PLANTATION SPOT RUBBER, 1916.

London shipments placed at 40 days and somewhat delayed. On November 28 Upriver fine was selling at 78 cents, First latex and Smoked sheet ribbed at 73 cents. London market conditions were generally firm with higher price levels supported by the British program of industrial expansion, and the government's requisition of more than half of the London stocks of 10,000 tons available November 1. Restricted permits at Singapore, lack of cargo space, and the loss of the "Arabia" with 350 tons of rubber on board also had their influence.

The first fortnight of December witnessed heavy buying in plantation rubber by large manufacturers. Para sorts, Africans and Centrals moved freely in sympathy with the buying activity; all recorded gains, with plantations leading the list. Holiday dullness characterized the last two weeks of the month with inquiries confined for the most part to futures. In London the sharp advance of plantations, influenced by the submarine menace, was followed by heavy forward sales that checked the buying movement. The ample supplies in sight would have stemmed the tide of an advancing market had it not been for the shortage of ship tonnage. On December 29 Upriver fine, spot, was quoted at 78 cents, First latex, spot, and Smoked sheet ribbed, spot, at 79 cents.

THE LONDON VIEW OF THE 1916 MARKET.

DURING the year 1916 the trade in rubber was continued under the emergency conditions introduced in 1915, and for the most part shipments have reached consumers with remarkable regularity and freedom. Lack of ship tonnage, however, became a matter of ever increasing concern and is now the big problem

facing the trade. Continued growth of the tire industry and the demands of the war have made the year's consumption of crude rubber practically equal to production, yet the world's available stock today is greater than ever before. London stocks on November 30 totaled 10,194 tons as follows: Plantation, 9,145 tons; Para, 177 tons; other kinds, 872 tons. British imports and deliveries of all sorts for the year were 68,405 and 65,018 tons respectively, the December figures being estimated. Of these amounts 58,341 and 54,800 tons, respectively, were other than Para and Peruvian.

THE MARKET

As a result of the bear squeeze which began in November, 1915, the year 1916 opened with very high prices and on January 6 plantation crêpe touched 4s. 3½d., but rapidly declined to 3s. With heavy fluctuations during the next three months crêpe declined to 2s. 4d. in July and to 2s. 2d. the three succeed-

Crêpe— Ribbed Smoked Sheet— Para.....

FLUCTUATIONS IN STANDARD PLANTATION GRADES AND FINE HARD PARA RUBBER, 1916.

ing months, the market being quiet in tone with small business. As in 1915, prices stiffened up in November, and aided by speculators and the reserved selling of producers reached 3s. 5½d., but the year closed quietly at 3s. Corresponding extremes for ribbed smoked sheet were 4s. 2½d. and 2s. 1½d. The fear of submarine losses and apprehension lest lack of cargo space prevent fulfilling forward contracts were important considerations contributory to the November rise.

While the demand for Para sorts has at no time equaled that for plantation, values have been well sustained and during occasional bursts of active trading prices have temporarily shown a premium over plantation. The highest and lowest quotations for the year were 4s. 1d. and 2s. 7½d. Good quality gutta percha realized high prices and the demand for balata has been constant throughout the year, Sheet closing at 3s. 2½d. and Block at 2s. 1½d.

The following closing prices for recent years may be of interest:

	Hard Fore Para	Negrohead Scrappy.	Negrohead Island.	Caucho Ball.
1914.....	2s. 10½d.	2s. 1½d.	1s. 3d.	2s. 4d.
1915.....	3s. 9d.	2s. 10d.	1s. 7d.	3s.
1916.....	3s. 3d.	1s. 11d.	1s. 3d.	2s. 2d.

The enormous exports of plantation rubber to the United States, estimated at £25,000,000, have influenced the level of American exchange in no small degree to the benefit of Great Britain.

THE WORLD'S PRODUCTION.

The world's total production of crude rubber of all grades is variously estimated by authorities at 178,000 to 198,000 tons, an increase of 32,000 to 52,000 tons and commonly spoken of as 25 to 28 per cent. The greater output of plantations in the Far East is chiefly responsible for this, about 75 per cent of the world's total production now coming from that source. Despite the shortage of assistants on these great estates, their rapid growth continues, as shown by the following table of the total production of crude rubber for the last three years:

	1916.	1915.	1914.
Ceylon and India	24,500	20,600	14,800
Malaya, etc.	105,500	72,800	49,700
Amazonas (Brazil, Bolivia and Peru)....	28,255	30,700	28,345
Peruvian and Caucho.....	8,245	6,800	8,655
West Coast, Africa.....	2,000	2,500	2,650
Benagula and Mossamedes.....	2,000	1,900	1,500
Loanda.....	5,000	600	450
Congo, French Congo and Soudan.....	4,500	3,000	3,900
From other sources	4,500	7,100	10,380
Totals	178,000	146,000	120,380

The production of South American rubber was somewhat increased, although including more Caucho ball and less *Manicoba* and Assare. Practically all the Amazon rubber has been consumed in 1916. Central America exported very little and almost no guayule. Increased amounts have been received from West Coast Africa, especially Congo and Soudan, but very little from East Africa and Madagascar. Although Penang doubled its supply of wild rubber, Sumatra, Java and Borneo exported less Rambong rubber but more *Hevea*. The production of jelutong and balata decreased considerably.

The following table shows the annual receipts and shipments at Para during the years 1914 to 1916:

	1916.	1915.	1914.
Receipts of Para	28,260	30,595	28,170
Receipts of Peruvian.....	8,245	6,800	8,655
Shipments of Para and Peruvian to Europe.....	12,045	14,440	15,985
Shipments of Para and Peruvian to America.....	22,185	22,960	21,690

The total 1917 production of crude rubber promises to show a further increase, although perhaps not as great as some anticipate because thinning out is wisely in active operation on many plantations. The demand shows no sign of abatement and many estates have already sold freely for 1917 and even 1918.

PLANTATION RUBBER.

While plantation acreages continue to increase in several regions of the Far East, as shown by the following estimates, the greater production of the past year is, of course, due chiefly to increased yields per acre.

	1916.	1915.	1914.
Ceylon	230,000	230,000	220,000
Malaya, Malacca	600,000	550,000	500,000
Borneo	30,000	20,000	20,000
Dutch East Indies, Java, Sumatra, etc....	500,000	450,000	400,000
India and Burma	40,000	40,000	65,000
German colonies, Samoa, East and West Africa	12,000	12,000	40,000
Totals	1,412,000	1,302,000	1,245,000

Plantations, chiefly of *Castilloa*, in Mexico, West Indies and Central and South America have shown no progress and the yields have been insignificant. The same is true of Ceara plantations in East Africa.

DISTRIBUTION.

The consumption of crude rubber of the various grades has been estimated as follows:

	1916.	1915.	1914.
England	25,000	24,000	18,000
Germany, Austria, etc.	1,500	3,000	16,430
France	8,500	7,000	5,000
Russia	20,000	16,000	11,610
Italy, etc.	4,000	2,500	4,000
Japan and Australia	5,000	4,000	2,400
America and Canada	114,000	89,500	62,940
Totals	178,000	146,000	120,380

All countries show increases except the Teutonic nations, the United States, Russia and Italy being most conspicuous. Scandinavian countries and Spain are manifesting increased activity in the rubber industry.

[The figures and information used in the above review were supplied by S. Figgis & Co. and Gow, Wilson & Stanton both of London.]

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur reports that the export of plantation rubber from the Federated Malay States for the month of December amounted to 5,717 tons, compared with 6,776 tons in November (which was the highest on record), and 5,111 tons for the corresponding month of 1915. The total export for the past year amounted to 62,763 tons, as against 44,524 tons in 1915 and 30,697 tons in 1914. In 1909 the total export was only 2,641 tons and in 1910 (the year of the "boom") 5,452 tons, or less than is now exported in one month. The Federated Malay States export of plantation rubber is about half of the world's output. Appended are the comparative statistics:

	1914.	1915.	1916.
January	2,542	3,473	4,471
February	2,364	3,411	5,207

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK.

JANUARY has proved to be a very dull and uninteresting month that closely parallels the market conditions of a year ago. While this time of year is generally unfavorable for large buying, the fact remains that the mills have been exceptionally busy, which augurs well for the future, at least. The considerable trading that has been indulged in between dealers is the only redeeming feature of an otherwise colorless rubber market. The large manufacturers appear to be well fortified with ample stocks and contract deliveries are regularly arriving. It would seem that the heavy buying interests are cautiously covering their requirements far enough ahead and in a manner that will not bull the market. The reports of ample plantation production and surplus stocks in London are reassuring, it is true, but the constantly increasing shipping difficulties constitute a formidable portent.

On January 2, First latex crêpe and Smoked sheet ribbed, spot, were 80 cents with January-June deliveries at 77 cents. Upriver fine was quite firm around 79 cents. The generally quiet conditions that have ruled during the month were reflected in easier prices that have recorded a decline of 6 cents in plantations and 2 cents in Paras. On January 27 First latex crêpe and Smoked sheet ribbed, spot, rubber were easy at 74 cents with futures as follows: February-March, 73 to 73½; April-May, 71, and July-December, 68. Upriver fine was steady at 77 cents.

LONDON.

The London situation has been remarkably sustained, in view of possible contingencies, by ample stocks. The importers are alive to the many difficulties that harass ocean trade at this time and also the inevitable result of an unbalanced market.

Stocks of rubber in London on January 1 compared with holdings at the same date in the two preceding years are as follows:

	1916.	Tons 1915.	1914.
Centrals and South American.....	24	10	16
Mattogrosso	15	2	66
Plantation (Ceylon, Malay, etc.).....	9,892	6,618	5,904
Rangoon and Assam	3	5	3
Penang.....	78	51	59
Malaysian	1
Mozambique	13	14	185
Madagascar	14	5	3
African, etc.	152	95	192
Totals	10,199	6,809	6,704

London imports for December were 5,150 tons against 6,118 tons for November; Liverpool imports for December were 1,771 tons against 1,192 tons for November. The reexports for December were as follows: London, 2,421 tons; Liverpool, 368 tons, compared to 4,656 and 951 tons, respectively, for November.

Prices have not changed to any great extent. On January 2, First latex crêpe and Smoked sheet ribbed were 73 cents in a firm market. On January 26, First latex crêpe and Smoked sheet ribbed had declined to 70.5 cents.

SINGAPORE.

A record quantity of 1,003 tons was catalogued for the December 6 auction, of which 586 tons were sold. There was a strong demand for First latex pale crêpe at 65.8 cents and Smoked sheet ribbed sold readily at 65 to 65.8 cents. The lower qualities sold well at an average price of 63.3 cents. The December 13 auction brought out 954 tons and only 109 tons were sold, showing the depressed market conditions. A few lots of Smoked sheet ribbed sold at 69 to 70 cents. First latex pale crêpe was not in demand and a few small sales were made at 68 to 69 cents. The average prices obtained at the last auction held in December and the first three in January are as follows: First latex pale crêpe, 63.1 cents,

and Smoked sheet ribbed, 62.36 cents. The amount sold was 1,672 tons, compared to 1,350 tons sold at the first four auctions in December.

COLOMBO.

The closing of the auction sales at Colombo due to the inability of the banks to handle drafts has made reports of price quotations impossible. Orders are therefore being sent to London for attention.

BATAVIA.

The auction of November 24, 1916, brought out 7,601 pounds, all of which was sold in a firm market, Smoked sheet ribbed bringing 65 cents. The next auction will be held on December 1, and 32,164 pounds are already registered.

MEDAN.

The fourth Medan auction was held on November 16, 1916, when 46,164 pounds were sold. First latex crêpe and Smoked sheet ribbed sold readily in a firm market. The next auction will be held November 30.

COMPARATIVE NEW YORK PRICES FOR JANUARY.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"During January the market for commercial paper in the rubber line has continued steady, the best names selling freely at 4½ per cent, and those not so well known 4½ to 5 per cent, with some small names at 5½ per cent."

January 19	62.05	62.48	367	Market dull. Supplies are large.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [December 13, 1916]: There was a very poor demand at the auction held today, and of a total of 960 tons catalogued for sale only 181 tons changed hands. Bidding throughout was very slow and owing to the absence of competition the majority of parcels were withdrawn. At the opening \$165 was paid for one lot each of Standard Crêpe and Standard Sheet, but as the sale progressed the falling off in the demand for these grades was most marked, a good number of lots not even eliciting bids. The lower grades are about \$4 lower on the week. There was no scrap sold. The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked	\$155@165	3/ @ 3/ 2½	72.98@85.39
Sheet, good ribbed smoked	155@157	3/ @ 3/ ½	72.98@73.99
Sheet, plain smoked	142@147	2/9¼ @ 2/10¾	68.41@70.18
Sheet, plain unsmoked	137@143	2/8¼ @ 2/ 9½	65.37@67.91

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to November 27, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States	16,705,051	24,193,954
Canada and Newfoundland	392,495	6,720
France	497,892	1,587,537

Russia	332,200	248,874
Italy		164,640
United Kingdom	21,856,189	20,113,766
Australia	791,277	783,651
India	1,530	1,358
Straits Settlements	119,933	43,680
Japan	260,421	315,529
Totals	40,956,988	47,459,709

(Same period 1914, 32,205,528 pounds; same period 1913, 23,387,980.) The export figures of rubber, given in the above table for 1914, include the imports reexported. (These amount to 2,686,710 pounds from the Straits Settlements and 714,637 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore gives the figures of the export of plantation rubber from Straits Settlements ports during the month of November as 5,247 tons, against 5,233 tons in October last and 4,292 tons in the corresponding month last year. This gives a total of 45,431 tons for eleven months of the current year, against 31,886 tons in 1915 and 17,393 tons in 1914. Appended are the comparative figures:—

	1914.	1915.	1916.
January	1,181	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,477	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
June	1,480	2,249	3,836
July	1,584	2,324	5,106
August	1,325	2,295	3,246
September	1,602	4,725	2,987
October	2,006	2,641	5,233
November	2,370	4,292	5,247
Totals	17,393	31,886	45,431

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the non-Federated Malay States, as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917

NEW YORK.

AMERICAN COTTON. The January cotton market has been steady compared to the violent fluctuations of last December. The speculative markets are apparently not so sensitive to conflicting rumors of peace and international complications as they were a month ago. It is generally believed that the present level of prices will continue until the market is again affected by new crop reports or trade disturbances. There are, moreover, certain interests that predict a return of 20-cent cotton before spring, but two important bull movements are hardly to be expected in one season. On January 4, middling spot cotton was selling at 17.55 cents and reached 17.80 cents on January 8. After minor fluctuations in the interim, spot cotton was quoted at 17.40 cents on January 29.

EGYPTIAN COTTON. Reports by mail from Alexandria under date of December 15, 1916, indicate that the reaction from the advance which commenced early in the season has resulted in a weaker market and prices have declined. The spot market has been very irregular. Sakellarides is becoming scarce and full prices are being paid for spot lots. The demand for uppers has not weakened and prices have remained steady.

The exports of Egyptian cotton from Alexandria for the period September 1, 1915, to August 31, 1916, were 728,319 bales, approximating 800 pounds. The United States imported 184,544 bales; England, 355,699; Spain, 20,332; France, 45,812; Japan, 25,801; Italy, 52,516; Russia, 42,619; India, Portugal and Greece, 1,026.

SEA ISLAND COTTON. Quiet has prevailed in the southern markets during the past month and prices have remained practically unchanged. There has apparently been a fair amount of inquiries but the volume of actual business has been small. The crop in sight at all ports on January 19 was 69,727 bales against 61,372 bales for the same period a year ago.

TIRE FABRICS. Business continues good with numerous price inquiries for contracts covering the last half of 1917. The fabric mills are sold until the middle of next summer and this year will doubtless show a marked increase in production.

It is estimated that 115,000,000 pounds of building fabric went into the manufacture of tires during the season of 1915-16. Of this amount Egyptian fabric furnished 75,000,000 pounds; Sea Island fabric, 30,000,000 pounds; Long staple (American) Peelers fabric, 5,000,000 pounds; Sea Island and Egyptian Cord fabrics, 5,000,000 pounds. The amount of tire building fabric required for 1917 is estimated at 141,000,000 pounds.

MECHANICAL DUCK. The undertone of the market is easier

and prices have eased off about a cent a pound. There is a good domestic demand for this time of the year, the mills are behind on orders and supplies are not over-plentiful. The slump in cotton had little effect on the spot market but resulted in easier futures. The situation may be said to be generally easier.

SHEETINGS AND DRILLS. Wide sheetings, drills and twills continue to be in good demand, 50 and 52-inch particularly. Prices are firm and have not changed since a month ago.

RAINCOAT CLOTH. Business has been quiet, due to the weather and the fact that January is usually a quiet between-season month. Prospects of a good Spring business in raincoat cloth are indicated by the numerous inquiries being received at this time.

In addition to the above movement, a large quantity of cotton has gone direct to Southern mills from interior points, and to Northern mills via Norfolk. While the exact figures are not available at present, it is conservatively estimated that the total amount of cotton so shipped is somewhere in the neighborhood of 12,000 bales.

THE MARKET FOR RUBBER SCRAP.

Copyright 1917.

NEW YORK.

THERE has been very little interest shown in the rubber scrap market during the past month. The volume of actual business transacted has been small and the large buyers have been conspicuously absent. January is the season of the year when supplies are usually allowed to diminish in view of annual stock taking. Moreover, the difficulties attending railroad shipments have had a marked effect in depressing the general business situation. The easier tone of the market is therefore explained and the softening of prices is only a natural result of the prevailing adverse conditions. The continued activity of the rubber mills and reclaimers affords the belief that supplies have been greatly reduced and active buying will not be long deferred. Generally

speaking, prices have undergone comparatively few changes during the month and with few exceptions the revision was downward.

BOOTS AND SHOES. This has been the weakest material on the list and prices have declined 3/8 to 1/4 cent. Consumers have consistently refused to buy at the prevailing prices with the expectation of lower values. Trimmed and untrimmed arctics were easy, and despite minor fluctuations, prices are the same as quoted a month ago.

AUTO TIRES. The situation in tires has been devoid of interest and prices have eased off accordingly. G. & G. white tires are 1/4 cent lower than a month ago. Bicycle and solid tires were dull and unchanged.

INNER TUBES. There has been little doing in tubes and business has been limited to small orders as buyers are confident of securing better figures. The quiet conditions ruling in the crude rubber market doubtless explains the easy position of tubes. Prices have fluctuated during the month but are now about the same as a month ago.

London imports of waste and reclaimed rubber for December were 78,100 pounds, and Liverpool 179,400 pounds, as compared to 109,300 and 20,100 pounds, respectively, for November. Exports for December were as follows: London, 1,158,900 pounds; Liverpool, 303,200 pounds, as compared to 1,244,000 and 106,800 pounds for November.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright, 1917.

NEW YORK.

THE demand for rubber chemicals and ingredients during the past month has been exceedingly active. The dealers report unprecedented business in rubber materials, and the many inquiries received indicate that it will continue. Ocean rates are abnormally high. Only limited space is obtainable at \$40 to \$60 a ton, the rate normally being \$7.50 to \$10 a ton. The heavy export demand has reduced stocks of many ingredients, and resulted in advanced prices. Imports have been seriously affected, due to well-known shipping difficulties, and the recent British requisition of 85 per cent of the cargo space will further complicate trade with neutral Europe. There is every reason to believe a protective tariff will eventually be levied on all rubber chemicals imported into England.

CARBON GAS BLACK. The heavy export demand has exhausted all stocks in sight, and prices have advanced 5 cents a pound.

Producers have sold their output and the dealers control the spot market. Contract deliveries have been called for promptly.

CARBON TETRACHLORIDE. There has been active call for this solvent, and spot supplies have been heavily drawn on during the past month. Prices show a gain of 2 cents a pound.

CARBONATE OF MAGNESIA. The steady demand from European and domestic sources has developed a strong market, exports to France being particularly heavy. Producers are reported to be well sold up. Sales have been reported around 12 to 13 cents.

OXIDE OF IRON. The pure, bright grades have been scarce and business restricted, due to the continued heavy demand. Supplies have been limited, orders held up and the producers are unwilling to increase production to meet the requirements of abnormal conditions. Prices have advanced 3 cents a pound since our last report.

SHELLAC. A marked advance was noted early in the month, due to reports that exports from India will be prohibited. The market became easier, however, at the close of the month.

WHITING. The difficulties of securing the raw material have apparently increased. English cliffstone is almost impossible to obtain. The demand has continued to be active, and prices have advanced. The domestic producers are making every effort to meet the demand, but are unable to relieve the situation.

ZINC OXIDE. Contract deliveries have been insistently called for during the past month, indicating the strong position of this market. The speculation market on American process qualities has advanced 1 to 1½ cents, but there is only a limited supply offered at 11 to 11½ cents.

TABLE OF CONTENTS ON LAST PAGE OF READING.**RUBBER AND SUBMARINE WARFARE.**

THE declaration by Germany of a submarine blockade of the British Isles has become not only a serious menace to the commerce of the world but a matter of peculiar interest and concern to the American rubber industry.

As the financial and commercial center of the world, London has been generally regarded as the world's great rubber market, and will probably continue to be as long as the bulk of plantation rubber is grown on British soil, even though Germany should temporarily succeed in isolating the United Kingdom from the rest of the world. Since the outbreak of the war, however, New York has been rapidly measuring up to London as a commercial center. Its increasing importance as a rubber market is indicated by the fact that of our total 1916 rubber imports amounting to approximately 115,609 tons, or about 65 per cent of the world's production, not far from 70 per cent came through the port of New York. Only 25,647 tons, or a little over 22 per cent, came by way

of England, and the balance of approximately 89,962 tons, representing our direct rubber imports, were 20 per cent greater than the total rubber imports of the United Kingdom for 1916, amounting to about 75,240 tons. Therefore, the ordinary London stocks on hand, averaging about 10,000 tons, do not figure to any considerable extent in the American supply, and double normal and even greater cargo rates, together with recent increases in war risk insurance of 125 to 900 per cent, will tend still further to encourage direct rubber shipments to New York via the Panama Canal and to augment greatly the noticeably growing imports at Pacific Coast ports, through which nearly 30 per cent of our 1916 supply came.

While the submarine blockade is primarily one of British waters it has brought about a virtual tie-up of all transatlantic shipping of neutral nationality in American ports, and a long continuance of this situation cannot but result in a far reaching disturbance of the industrial life of the United States. Indeed, on February 15 it became necessary for 30 railroads to declare an embargo on export shipments through eastern ports until the vast accumulation awaiting sailings can be taken care of. From the standpoint of the rubber industry, therefore, exports are more seriously affected than imports, the situation in respect to raw materials being better than in certain other lines of manufacturing. There may be a temporary shortage in New York crude rubber stocks with consequent speculation and upward price fluctuations, but the dull January market indicated that most manufacturers have sufficient supplies on hand to tide them over this period. Our principal crude rubber supply routes still remain unaffected, but a considerable part of our exports of manufactured rubber goods, which amounted to nearly \$35,000,000 for the year 1916, are seriously menaced.

The policy of the United States in this commercial crisis has not been determined, and what England as mistress of the seas can do to alter the situation remains to be seen. At the time of writing the program to isolate her completely by submarine destruction of shipping at the rate of a million tons a month has fallen far short of fulfilment. Reported sinkings to date have not averaged half that. British officials express the belief that through the capture of undersea craft, convoy of merchant vessels and the establishment of strongly guarded ocean shipping lanes the British navy will have the submarine menace well in hand within two months and do not anticipate being obliged to resort to the cargo submarine in a struggle for existence. Unless the past rate is exceeded it will take approximately $3\frac{1}{2}$ years to destroy the present British merchant marine totaling about 15,850,000 tons, and every British shipyard is running to full capacity day and night replacing lost tonnage. Since the outbreak of the war this has amounted to 4,000,000 tons, of which 3,000,000 tons is said to have been more or less adequately replaced.

SAVING AND RECOVERING SOLVENTS.

AT the close of the first instalment of his article on rubber solvents, elsewhere in this issue, Lothar E. Weber, Ph. D., touches upon the timely and pregnant subject of profitable solvent recovery, pointing out several of its advantages, difficulties and essentials. The prevailing high prices of gasoline and naphtha have stimulated interest to a remarkable degree of late in devices for both saving and recovery, and inquiries regarding processes and apparatus are of frequent occurrence.

The initial move in saving is at the storage plant, where tanks, pipes and faucets should be as tight as possible. Vessels used to carry the solvent should always have covers. More important, however, is that muddlers and mixers of all sorts should be closed when a batch is being put into solution. When finished it should be drained off into covered cans.

In ordinary spreading the solvent is evaporated as soon as possible, and lost. The beginning of solvent recovery is an exhaust hood hung over the spreader that collects the naphtha fumes. These are then easily condensed by chilling, and drawn off for further utilization.

Most of the solvent recovery mechanisms are either German or English in origin, and were designed for the great proofing establishments abroad. The Weber-Frankenburg, Vincent, Heinzerling and Spindle are the best known. While differing in many details, they do the work in much the same way. In a word, the fabric, as soon as it is proofed, enters a closed chamber, heat volatilizes the solvent, which is carried against cold surfaces, condensing it. Dripping from these surfaces, it is collected in tanks, often in water, drawn off and stored for re-use.

The whole apparatus is simple and one that any chemical engineer can construct without difficulty.

Of course, the idealist is just now to the fore with plans to do away with solvents in rubber work; to spread by heat only, and, carrying the thought further, to heat the tops of makeup tables, use hot rollers for rolling, hot stitchers for stitching, etc. But as far as extensive accomplishment goes that is all in the future.

THE HOUSING OF EMPLOYEES.

ONE of the greatest progressive industrial movements of the day is the comfortable housing of employes by their employers. The general prosperity of the country has made it possible, indeed imperative, because the refining influences of shorter working hours, better wages and superior education have brought about a higher standard of living which calls for expression chiefly in the home. It is a noble movement for any

great firm to identify itself with, and therefore a pleasure to state that the rubber and allied industries are well represented; also that the end is not yet.

But lest those who know little of it assume the enterprise to be purely philanthropic, its practical side should be emphasized. To live like a good citizen is to become one, and those firms who have made it possible for every operative to do so agree that benefiting the employe likewise benefits the employer. All report a better individual tone, an increased and improved mill production, a marked tendency toward permanency of employment, and a larger spirit of coöperation between the operative and the mill management.

These highly desirable results are achieved at virtually no ultimate expense to the firm, for it has been found that most men desire to own their homes and are willing to pay for them when an easy-payment plan within their means presents itself. A large firm erecting many cottages can build attractively and well for less money than the individual can build poorly. The financial standing, credit, expert advice and greater purchasing power of the employer insure minimum expense and afford the employe the opportunity to enjoy his house while paying for it. Meanwhile the firm gets legal interest on the investment and reaps many cumulative benefits besides. As contrasted with disorganized individual effort, building many houses along the lines of maximum standardization in design, adaptability to the application of the most economic methods of construction and coördination of the process of shop manufacture effect such further economies in cost as even to make possible permanent fireproof construction in certain localities.

In view of the manifest importance of this subject the series of articles setting forth what has already been accomplished by the rubber and allied industries, which begins on another page of this issue, is of timely interest in anticipation of further spring building operations. These articles are by John Barnard, a Boston architect who has studied the better housing of employes from its inception in England several years ago; who has visited Port Sunlight, Bourneville, Hampstead and other model British garden villages, and who has a thorough grasp of this industrial problem of the day and the means to solve it.

BRITISH RUBBER ASSOCIATIONS.

THAT the welfare of the British rubber trade will be closely guarded from now on and particularly after the war is suggested by the associations now in existence. They are The Rubber Growers' Association, Inc., The British Rubber Tyre Manufacturers' Association, Limited, The Rubber Trade Association of London, The British Rubber Shoe Manufacturers Association, The Balata Belt Manufacturers' Association, all of London; and The India Rubber Manufacturers' Association, Limited, of Manchester.

The Nature and Uses of Rubber Solvents—I.

By Lothar E. Weber, Ph.D.

[In the second installment of this article Dr. Weber will discuss benzol, solvent naphtha, shale oil, carbon bisulphide and carbon tetrachloride.]

IT is only in one or two specialized branches of the rubber industry that solvents play an integral part in the process of manufacture. On the other hand, the large majority of rubber articles require the services of a solvent in some part of their manufacture, or at least for some component part entering into their manufacture. The function of the solvent in the latter case may seem to be an unimportant one, but the manufacturer would be sorely pressed without its aid. The importance of the solvent is realized more vividly when for any one of a number of reasons it becomes a source of defective goods. It can be said that just as a chain is no stronger than its weakest link, so is a rubber article no stronger than its cement. Accordingly, the question of solvents is an important one for the rubber industry and the rubber manufacturer.

While the number of liquids which have the property of dissolving rubber is numerous, relatively few of them find commercial application in rubber manufacture. The origin of these latter it is proposed briefly to describe, as well as their use in the rubber industry, the specifications which they should meet, and the defects caused by failure to meet these specifications.

GASOLENE.

In this country the solvent which finds the most extensive application in the rubber industry is gasolene. This material is a product of crude petroleum, in which it is present to the extent of from 10 to 15 per cent, depending on the origin of the petroleum in question. By means of distillation crude petroleum can be separated into various "fractions," one of the most important of which is gasolene.

Unfortunately gasolene is not a homogeneous substance, but a complex mixture. Not only do the actual materials constituting it vary, but their relative amounts show wide fluctuations, while still permitting the product to be sold and bought as gasolene. These constituent substances are known chemically as hydrocarbons (that is, substances composed of carbon and hydrogen), and more specifically as paraffin hydrocarbons.

These constituting members of gasolene have a very close chemical relationship to each other. By way of analogy, they may be compared to a sectional bookcase, in that the latter is composed essentially of a base and one or more units. Just so these paraffin hydrocarbons are composed of their basic substance, added to which, is a varying number of units or increments. Naturally a hydrocarbon composed of the basic substance and, let us say 6 increments, differs in properties from a hydrocarbon composed of the basic substance and 7 increments. We can look upon gasolene as a mixture of hydrocarbons, each hydrocarbon being composed of the basic substance and a varying number of increments.

Since the components of gasolene may show such variation, some specific designation is necessary for the purpose of characterization. Unfortunately specific gravity has been chosen for this purpose, as in the early days of the petroleum industry it was soon recognized that the more volatile portions of the crude oil had a lower gravity, in fact that a relationship existed between volatility and gravity. It therefore became customary to sell gasolene on a gravity basis, the Baumé gravity scale being generally employed.* That this gravity designation has still survived is very much to be regretted.

(*According to the Baumé scale for liquids lighter than water, the reading increases with decreasing gravity. That is to say, 75-degree Baumé corresponds to a lighter gravity than does 60-degree Baumé.)

In the majority of cases it is the volatility of the gasolene which determines its desirability. In order, then, that the designation of the gasolene may be significant, there should be a direct relationship between the gravity and volatility. While this was to a large extent true in the early days of the petroleum industry, when crude oil had only relatively few sources of origin, it no longer holds true to-day. It is a matter of common observation that during recent years the volatility of gasolene has been continually decreasing with little or no change in the gravity. To be sure, in the case of motor gasolene there have been changes in both the volatility and gravity, but the 60-degree gasolene of to-day is much less volatile than the material sold under the same name three or four years ago.

The more accurate and significant method of designating gasolene is by reference to its boiling points. If gasolene were a homogeneous liquid composed of only one hydrocarbon, it would have a definite boiling point just as water has a definite boiling point of 212 degrees. As has already been pointed out, however, gasolene is not a homogeneous substance but consists of a mixture of closely related hydrocarbons. As these hydrocarbons boil at different temperatures, the mixture obviously cannot show a constant boiling point. It is for this reason that we find that whereas an average sample of gasolene begins to boil around 140 degrees F., a temperature of well over 300 degrees F. is necessary before all the gasolene will boil. There being a very close relationship between volatility and boiling point, by knowing the temperatures at which definite volumes of gasolene boil, one is in a position to compare accurately the volatility of one gasolene with another.

For the sake of clarity, there are tabulated below the boiling points of a few samples of gasolene taken at random:

	A	B	C	D
5 per cent boils under..	194 deg. F.	162 deg. F.	118 deg. F.	145 deg. F.
10 per cent boils under..	197 deg. F.	176 deg. F.	133 deg. F.	147 deg. F.
30 per cent boils under..	212 deg. F.	223 deg. F.	154 deg. F.	165 deg. F.
50 per cent boils under..	221 deg. F.	252 deg. F.	180 deg. F.	192 deg. F.
70 per cent boils under..	244 deg. F.	286 deg. F.	206 deg. F.	221 deg. F.
90 per cent boils under..	289 deg. F.	343 deg. F.	244 deg. F.	302 deg. F.
95 per cent boils under..	314 deg. F.	365 deg. F.	262 deg. F.	329 deg. F.
Specific Gravity	61 deg. Be.	60 deg. Be.	71 deg. Be.	72 deg. Be.

A represents a motor gasolene purchased in 1911.

B represents a motor gasolene of recent date.

C represents a 71-72-degree Baumé gasolene purchased in 1911.

D represents a 71-72-degree Baumé gasolene of recent date.

Comparing samples A and B, it will be observed that while the gravity of the two gasolenes is practically identical, there is a wide difference in their boiling points. Similar facts are observed on comparing samples C and D, which are of practically identical gravity. It is therefore evident that the designation of a gasolene by its gravity gives little indication as to its boiling points, and hence, as to its volatility. It would be much to the benefit of the rubber manufacturer if gasolenes could be bought or even offered on a boiling point basis. It would be sufficient merely to state the temperatures at which say 5, 50 and 95 per cent of the material boils in order to give the purchaser a general idea regarding its nature.

The three major uses of gasolene in the rubber industry are in (1) Spreading, (2) Dipped goods, (3) Cements. It may therefore be of interest to refer to the requirements which are demanded of the gasolene in each of these three applications.

SPREADING. For spreading purposes it is not desirable to have a gasolene showing extreme boiling points. That is to say, low initial points and high final points are undesirable. On the whole, sample A is a satisfactory gasolene for spreading, but

it would be preferable if 95 per cent of it boiled under 300 degrees F. rather than under 314 degrees F. Sample *B* is much less desirable, chiefly on account of the high final boiling point. The initial boiling point is a little lower than in the case of *A*, but scarcely sufficient to have it react to its disfavor. Sample *C* is considerably too low in boiling points for advantageous use in spreading. Sample *D* is much less desirable than sample *A*, for the reason that its extremes show wider fluctuations. For spreading purposes, it is undesirable to have the initial boiling points much under 160 degrees F., for the reason that if such is the case, large losses of gasolene are apt to take place while the rubber compound is being churned and also while the churned mass lies in the spreading room prior to use. The majority of the material boiling below 160 degrees F. is lost before the rubber dough reaches the spreading machine. An even more serious objection is the fact that these low boiling portions are not only non-solvents for rubber, but actually inhibit the dissolving action which the higher boiling portions exercise. The result is that these low boiling fractions, when present, actually tend to decrease the solvent power of gasolene.

On the other hand, if the gasolene contains an excessive amount of high boiling material, it is difficult to drive off the last traces on the spreading machine. The result is that the latter are retained by the coating and as a result of being subsequently vaporized by the higher heat of vulcanization become the most fruitful cause of what is known as "pin holes." To be sure, it is possible to overcome the danger of "pin holes" even when a gasolene is used containing much high boiling material, but not without seriously impairing the output of the spreading machine.

DIPPED GOODS. Since the evaporation of the gasolene used in dipped goods has to be accomplished without the aid of heat, comparatively high volatility is required. As in the case of spreading work, initial low boiling points are undesirable in that they inhibit the dissolving power of the gasolene and for the further reason, that they tend to produce blisters. If the nature of the gasolene is such that it evaporates too quickly, the outside surface of the cement dries, with the formation of a film, enclosing some gasolene underneath it. In the course of time this gasolene will tend to vaporize, and as the pressure of the latter becomes sufficient to rupture the outer "film," a blister results. On the other hand, if the boiling points are too high, blisters will also occur, as some gasolene will be retained. When the dipped articles are then subjected to the slightly elevated temperatures of the acid cure, the retained gasolene will be vaporized, again with the formation of blisters. A composite sample of *C* and *D* would be the most desirable; that is, a sample having the initial boiling points of *D* and the end boiling points of *C*.

CEMENTS. The gasolene requirements for a cement are essentially ease of volatility, and what is closely related thereto, complete vaporization of the solvent. Any residue greatly impairs the adhesive qualities of the cement and also its lasting qualities. Boiling points similar to those desirable for dipped goods will generally be found satisfactory.

The price of gasolene having steadily risen owing to the enormous increased demand, it is natural that attempts should be made for the purpose of obtaining substitutes for gasolene or at least of converting less valuable petroleum products into material having essentially the same properties. While it has not yet been possible to find such a substitute, two products are known which are used quite extensively in admixture with gasolene. The two materials in question are: (1) casing-head gasolene and (2) cracked gasolene.

CASING-HEAD GASOLENE. The source of this material is natural gas, from which it is obtained either by compression or else by so-called "washing" with oils of high boiling point. Casing-head gasolene is an exceedingly volatile material and for this reason comes on the market only in admixture with in-

ferior grades of gasolene. It is used primarily as a "sweetener," that is to say, for decreasing the boiling points of gasolene which would otherwise be unsatisfactory owing to excessively high boiling points. From the standpoint of the rubber manufacturer the addition of casing-head gasolene is undesirable, for the reason that the resulting mixed gasolene shows low initial boiling points and high end boiling points. As has been pointed out above, the rubber manufacturer is interested in a gasolene having relatively narrow extremes of boiling points. Even though the boiling points of the mixed casing-head gasolene show these variations, by suitable manipulation of the mixture the gravity is such as to give no indication of the presence of a mixture. This again shows the fallacy and undesirability, from the rubber manufacturer's standpoint, of estimating the value of gasolene purely on a gravity consideration.

CRACKED GASOLENE. The cracking of petroleum oils is a relatively old art, but it is only within recent years that special attention has been given to this process. Cracked gasolene is obtained usually from kerosene or fuel oil, and consists in subjecting either of the latter to high temperature and pressure. By means of the cracking process the high-boiling petroleum hydrocarbons are converted into hydrocarbons of much lower boiling points; so much so, that a large proportion of the material resulting from the cracking process boils within the limits of the average gasolene. However, a wide variety of substances are formed in this operation, some of which have markedly different properties than the paraffin hydrocarbons which constitute gasolene as we know it. Cracked gasolene is especially rich in a group of substances known as "olefines." These olefines are very undesirable from the standpoint of motor gasolene and are largely responsible for the so-called "carbon" deposits in the cylinders. This is one of the reasons why cracked gasolene comes on the market only in the form of an admixture with natural gasolene, and then only mixed in relatively small proportions. From the standpoint of the rubber manufacturer it is rather doubtful if these olefines are a detriment, except for the fact that their boiling points are relatively low. To be sure, if gasolene which contains much cracked material is allowed to lie in the tank for an extended period, the olefines have a tendency to go over into a thick viscous oil which settles at the bottom. However, in most rubber factories the gasolene does not have a chance to be stored sufficiently long, prior to use, to enable the formation of this heavy oil to take place.

SOLVENT RECOVERY. Many attempts have been made to recover or partially recover the gasolene used in certain branches of the rubber industry, notably in the spreading operation. The volume of gasolene in a spreading plant vaporized in the course of a month's operation reaches staggering figures and it is only natural that the recovery of the solvent should have been given serious thought. While theoretically the recovery of gasolene from the spreading operation is a simple matter, the practical difficulties and cost of equipment have so far stood in the way of its applicability. In this connection it is not generally recognized that even if all the gasolene which is vaporized in the spreading room were successfully condensed, the resulting material would have properties differing materially from those of the original gasolene. Owing to the relatively low initial boiling points of gasolene, considerable losses take place during the churning operation; so much so, that if only the gasolene which is vaporized in the spreading room were condensed, its boiling points would be very much higher than those of the original gasolene. The recovery process, in order to make it complete, would have to be extended to the churn room. It can readily be seen, therefore, that the size and cost of equipment of such a complete recovery plant would be high. Nevertheless, there is every reason to expect that a recovery plant would be a good investment if the purely mechanical and engineering difficulties are solved.

COTTON READY FOR SHIPMENT AT CALENICO, IMPERIAL VALLEY, CALIFORNIA.

Long-Staple American Cotton by Irrigation.

A MIRACLE is being performed in that part of the United States known as "the great Southwest," which promises soon to become the principal American source of long-staple cotton. Irrigation has provided the key to successful agriculture in Arizona, southern California and northern Mexico, where hundreds of thousands of acres of arid lands and great stretches of the Colorado Desert, on which only sagebrush, cactus and the pallid Spanish dagger formerly grew, are being transformed into one of the most bountifully productive regions of America. Grains, fruits, nuts, alfalfa, sugar cane, garden truck and live stock have in the past been looked upon as the chief products of irrigation, but the tremendous cotton yields of the past year indicate that this important crop may soon take precedence over all others. Weavers of higher-grade fabrics who are striving to meet the growing demands of rubber tire and other manufacturers are focusing their attention upon this remarkable development in the belief that an adequate supply of long-staple cotton grown within our borders will soon be assured. A few leading tire concerns are manifesting even more direct interest, one having contracted with a planter in Imperial Valley, California, to take annually for five years the entire crop from 5,000 acres of new land, and the other being about to plant 1,000 acres of cotton in Salt River Valley, Arizona, to insure its supply of tire fabric.

Although the United States provides considerably more than half the world's cotton production (57.4 per cent in 1915) and exports a tremendous quantity annually (6,191,110 bales for the year ending July 31, 1916, or more than half the year's ginnings) it does not grow an adequate supply of long-staple cotton to meet the American demand for thread, knit goods, lace, tire and other higher-grade fabrics requiring great strength. Of the 420,995 bales of foreign cotton imported during the fiscal year 1916, statistics show that 350,796 were long-staple Egyptian. At least half of this was used in the manufacture of tire fabrics, for it should be noticed that considerably less than 1 per cent of the total 1915 American cotton crop of 11,191,820 bales was of the Sea Island variety. With slight prospect of any considerable increase in this percentage it is not surprising that the phenomenal growth of the cotton planting industry in California since 1909 should set tire manufacturers and fabric weavers to thinking.

Tires average about 5 pounds of fabric each, and as it is estimated that the 1917 tire production will reach 25,000,000, about 125,000,000 pounds of fabric, equivalent to over 250,000 bales of long-staple cotton, will be required to meet this demand alone. 350,000 acres planted to Durango or Egyptian cotton in the Southwest and scientifically cultivated would render the American tire industry independent of imports, and this is only a little over one-third of the unimproved land in Imperial Valley alone that can be irrigated by the available water supply, which can be even further increased by the building of reservoirs.

The outstanding fact which has awakened the tire industry to its great opportunity is the 1916 crop of Imperial Valley cotton, grown entirely by irrigation and amounting to 70,000

bales—equivalent to 76 per cent of the 1915 Sea Island total of 91,844 bales, 5,824 of which were exported. Not all of this was long-staple, though it might have been, for the Durango variety thrives there and is said by experts to be equal in quality to the choicest Sea Island and better than much of the Egyptian cotton now offered to the trade.

From approximately 100,000 acres on both sides of the international boundary, about 45,000 acres in the United States and 55,000 in Mexico, the 1916 crop reached the record total of 40,000 short-staple bales of big boll mebane, averaging 18 cents a pound, and 30,000 long-staple Durango bales averaging 24 cents. Some of the former brought as high as 19 cents, and of the latter as high as 28 cents, so that the value of the total cotton yield of Imperial Valley is estimated at \$7,500,000 to \$8,000,000, making this the premier crop of what is becoming the richest agricultural community in California.

As it costs an average of 9 cents per pound to produce short-staple cotton and 12 cents to grow, pick, haul and gin the long-staple, the planter who sold at 18 cents and 24 cents respectively, as many did, doubled his investment at the rate of \$45 and \$60 per bale, to which may be added \$15 to \$20 per bale for the seed. This profit of \$60 to \$80 per bale, the prospect of growing a bale or better per acre, together with an ever-growing demand at record prices are the inducements that will probably double the cotton acreage of Imperial Valley in 1917.

Despite the prospect of enormous cotton acreages throughout the South next year, 95 per cent of this will be short-staple so that record crops will not depress the high prices obtainable for the California product, because the demand for long-staple will still be in excess of the probable supply. Buyers who are trying to contract forward for Imperial Valley short-staple cotton at 17 cents and long-staple at 23 cents are finding few takers, for the planters realize that the present surplus on hand is smaller than at any time within the past decade, and that with increased consumption and a short crop in other growing countries, the end of the war, should it occur, would immediately open up greater markets abroad. Should the war continue, they also know that American munition manufacturers consumed 900,000 bales during the year 1916, exclusive of heavy exports to Canadian, British and French factories.

With the entire question of cotton as one of the permanent and most important farm industries of southern California apparently settled for good and all, Los Angeles, as a great cotton market of the near future, promises to take its place beside the great cotton ports of the South, and to outstrip Savannah, Brunswick, Pensacola and Charleston as a shipping point for long-staple cotton. Its railway connections and fine harbor provide the shipping facilities to send cotton textiles all over the country, the western hemisphere and even around the world, and already local capitalists of vision are beginning to discuss a project to erect large yarn and weaving mills. A growing conviction is being manifested that cotton goods and by-products for consumption west of the Rocky Mountains should be manufactured in California.

It is well to mention the matter of by-products, for time was when the old-fashioned planter had to burn the seed and stalks to get rid of them. Now, through the ingenuity of man and his modern machinery there is no waste whatever, and cottonseed products are numerous, varied and valuable. Linters, oil, cake and hulls all have their uses. Even cotton stalks are employed in the manufacture of fiber, paper, carpets and vegetable ivory or cellulose.

From the long-staple cotton going to make up a bale, about 1,200 pounds of seed are extracted, and from short staple the yield is only a little less, so that Imperial Valley ranchmen last year received in the neighborhood of \$1,250,000 for seed alone. At the beginning of the cotton season in September the three oil mills in the valley began paying \$20 a ton for cottonseed, but because of improved shipping facilities raised the price to \$30, and toward the close of the year to \$40.

Of the immediate products of expressing the oil from the seed, the linters are used for absorbent cotton and in the manufacture of high explosives. The oil makes excellent soap, is widely used in cooking as a substitute for lard, and when refined often replaces olive oil for the making of salads. The hulls are in demand for feed and the cake for both feed and fertilizer. Cotton hulls make an excellent fattening food for cattle, while cottonseed meal, obtained by grinding the cake, is not only fattening but when fed to sheep is said to produce 15 to 20 per cent more than the normal growth of wool. The five states of Utah, Montana, Oregon, Idaho and Washington will consume all the cottonseed meal and hulls the Imperial Valley can produce for years to come, thus in a sense turning cotton into wool. For winter feeding the cake is made into balls about the size of an English walnut for scattering over the snow.

Thus this great new agricultural industry is becoming of keen interest to labor as well as capital. Already it has provided an exceptional opportunity for unskilled workers. Shortage of cotton pickers at the beginning of the season threatened disaster, but the County Farm Bureau soon had the problem well in hand with laborers coming from all parts of southern California, Texas and Oklahoma. The fact that the plants would not rust nor mildew on account of the absence of rain and fog made it possible to extend the picking season considerably and so helped mightily in solving the labor problem. Los Angeles bootblacks and even women have been making the wages of building mechanics in the cotton fields. The rate paid ranged from \$1.00 to \$1.25 and even \$1.50 per 100 pounds, depending on the stand, and ginning averaged \$4.50 per bale.

The raising of cotton in this the largest irrigated cotton area in the United States has many advantages. Government crop reports show that the yield is high and that the staple has length, strength and uniformity; characteristics which are very desirable, and due, in part, to the absence of periods of drought or of excessive rains. Government statistics also show that the average yield per acre in Imperial Valley was 400 to 500 pounds, or approximately one bale, whereas the average in the entire country was only 170 pounds. The reasons for this greater yield

are the warm climate, rich silt soil, the ability to apply water whenever needed, freedom from pests and longer growing season.

Because of this latter fact, instead of one crop, Imperial Valley cotton plants produce two, or more correctly, a series of crops. Cotton takes very little from the soil, and a simple system of occasional crop rotation or fertilizing enables one to carry on a plantation indefinitely. As Department of Agriculture officials credit Imperial Valley with the highest priced short-staple cotton, averaging 16 to 18 cents against 11.3 cents for the entire country, it is not surprising that tracts are known to have paid the full cost of the land plus the cost of irrigating, planting, cultivating, picking and marketing in one season and still netted a profit of \$25 an acre.

On many well-worn plantations in Georgia and Alabama pickers consider themselves doing well to get half a bale of short-fiber cotton to the acre a season, while several tracts under irrigation in the Imperial Valley are on record as having produced two bales of long-staple cotton to the acre and two crops a year which has brought as high as 28 cents a pound, and this on land that cost less than \$100 an acre, water rights included.

Cotton has been grown in this locality on a commercial basis for only a few years. There were 5,986 equivalent 500-pound bales ginned in 1910, 9,790 in 1911, 8,215 in 1912, 22,838 in 1913, 49,835 in 1914, and 28,551 in 1915. According to the estimates of the Department of Agriculture, the cotton area in

COTTON FIELD IN THE IMPERIAL VALLEY.

1916 was 98,000 acres, or about double the average in cultivation the previous year.

The statistics above include cotton grown in Mexico (Lower California) and brought into this country to be ginned. The same conditions of soil and climate are found in the Mexican portion of Imperial Valley as in the American, while the cost of cultivating and picking is less because of the availability of Chinese labor. According to official reports, the quantity of unginned cotton imported into the customs district of southern California from Mexico during the year ending July 31, 1915, produced about 21,000 bales of lint.

Some fields below the boundary line yield enormously, several growers obtaining a bale and a half to two bales to the acre. One grower who leased 1,600 acres at \$10 an acre raised 2,000 bales of fine quality short-staple cotton and sold it for \$160,000. His profits in a single season were about \$75,000. From the same field a cotton stalk was cut in October that had more than 300 fully matured bolls. Rules for estimating yields are that 65 matured short-staple bolls will make a pound of cotton, and that land when planted in rows three and a half feet apart and the plants two feet apart will yield one bale to the acre if the plants average forty bolls. An acre of plants such as was cut from this Lower California field would produce more than 7 bales.

The development of Imperial Valley, due to irrigation, has been phenomenal. Fifteen years ago the census could have been taken on the fingers of one hand. To-day it has increased to over 50,000 and the thriving towns of Calexico, El Centro, Im-

perial, Brawley, Holtville, Seeley, and Calipatria take a just pride in their fine churches, schools, libraries and community institutions. About 500,000 acres are in cultivation—approximately 100,000 acres each in cotton, alfalfa, and barley, besides immense tracts devoted to fruits and vegetables and the raising of over 200,000 head of cattle, sheep, horses, mules and hogs—and the yearly agricultural production considerably exceeds \$25,000,000. Land values vary from \$65 to \$150 an acre according to proximity to towns and the assessed property valuation is not far from \$90,000,000, yet the county tax rate steadily decreased to \$1.90 in 1914.

According to a recent report of the chief engineer of the Imperial Irrigation District, 1,400,000 acres may be irrigated from the Colorado River. Of this vast area, 700,000 acres are in Imperial Valley proper, 500,000 acres in the delta of the Colorado and 200,000 acres in Sonora, Mexico, below the Yuma Valley. Thus no less than 900,000 acres of irrigable land still remain undeveloped—an area that would render the nation independent of long-staple cotton imports for many years to come.

Without the need of a dam, the water for the Imperial Valley irrigation system is diverted from the Colorado River through a concrete head gate about 12 miles below Yuma, Arizona, and 4 miles above the Mexican line. The main canal carries the water through the natural channel of the Alamo River to headings whence distributing canals divert it again to the various farms. The main channel was originally owned by the California Development Co., but during the past year the people of Imperial Valley organized the Imperial Irrigation District and bonded it for \$3,500,000 to purchase the irrigation system. As present canal facilities embrace about 574,000 acres, the bonded debt is only about \$6.10 per acre. The average cost of irrigation water throughout the valley is about \$3.50 per acre a year, varying somewhat with the character of the soil and the nature of the crop.

Most of the cotton grown in the Salt River Valley, of Arizona, has the same characteristics as the cotton grown in Egypt, having been propagated from seed brought from that country. It is grown on irrigated land and the average yield is high, especially where the soil has been improved by alfalfa and beneficial river sediments. Arizona's production for the past four years has been 2,229 bales in 1913, 7,142 bales in 1914, 1,981 bales in 1915 and about 4,000 bales in 1916. The falling off in 1915 was due to smaller planted acreage on account of low cotton prices at that time. But with approximately 7,000 acres planted in 1916 and both demand and prices promising for some time to come, the permanent establishment of the Egyptian cotton industry in that state seems assured.

Including the Roosevelt Dam, the government has expended over \$10,000,000 on the Salt River project for the benefit of the people in the intensive cultivation of 219,000 acres of land where climate, soil and water are virtually ideal. The present cost of water for three acre feet, the usual amount required, is only \$1.50 a year, and it is expected that within a few years it will be delivered practically free because of the sale of surplus water outside the project area. There will also be a revenue of \$1,000,000 from 27,000 electric horse power, 10,000 of which, yielding \$400,000 annually, is already being consumed by mining concerns.

There are no government lands in the Salt River Valley. Every acre is in private hands and the acreage of rentable lands obtainable on lease is comparatively small, but land prices are still reasonable and terms of payment convenient. As the area of the project is limited, however, title to every irrigable acre promises to be steadily on the increase. Improved land that is being farmed costs \$100 to \$200 per acre, while lands for cotton are still obtainable at \$100 to \$125 per acre. Yields per acre have not equaled Imperial Valley, but they are far above the average and with scientific cultivation should reach a bale per acre.

LONG-STAPLE COTTON IN 1915-16.

IN addition to the wealth of statistics and other information characteristic of previous reports of this nature, Bulletin 134, recently issued by the Department of Commerce, Bureau of the Census, entitled "Cotton Production and Distribution, Season of 1915-16," contains considerable information of interest to manufacturers of automobile tire fabrics. Several quotations selected from various sections of the bulletin have been pieced into the following continuous narrative:

The limited supply of cotton having a long staple, and the world-wide demand for cotton of this character in the manufacture of thread and the higher grade fabrics, and recently of automobile tires, have given such varieties an importance seemingly out of proportion to the amount produced. While at one time long-fiber Sea Island cotton grown in the West Indies provided a large part of the total used in Europe, the world's production of this variety at the present time is comparatively insignificant, averaging less than 100,000 bales per annum. The quantity of long-fiber cotton produced in Egypt last year was less than a million bales, and the quantity of upland cotton with a staple of 1½ inches or more in length produced in the United States from the crop of 1915, according to the estimate of the Department of Agriculture was about 825,000 bales. Long staple cotton is also produced in comparatively small quantities in India, Brazil, Peru, and several other countries. Altogether the total of long staple cotton—that is, cotton having a fiber of 1½ inches or more in length—produced throughout the world from the crop of 1915 did not, in all probability, exceed 2,000,000 bales.

The 1915 crop of Sea Island cotton is given as 91,844 running bales divided as follows: Georgia, 57,572; Florida, 28,094; South Carolina, 6,178. Of this total 5,824 bales were exported. The 1916 exports, however, were only 3,580 bales.

It might be presumed that the prices generally received for Sea Island cotton would cause a large increase in the acreage, but attempts to grow it in other parts of Georgia, Florida, South Carolina and other states have been so unsatisfactory that practically all efforts to raise it outside of certain well-defined areas in the states named above have been abandoned.

Of the total consumption of cotton in the United States during the year ending July 31, 1916, amounting to 6,397,613 running bales, 82,645 were Sea Island and 316,995 foreign. A very large proportion of the foreign cotton consumed was Egyptian; imports of Egyptian cotton by American manufacturers have led to efforts to grow in the United States cotton having its characteristics, and some encouragement has been given the movement by the success attending its culture in Arizona.

The status of the cultivation of Egyptian varieties of cotton in this country is presented in the following statement, prepared by the Department of Agriculture:

The abnormally low prices of 1914 caused a greatly diminished acreage to be planted to Egyptian cotton in Arizona in 1915. The total production last year amounted to only about 1,100 bales of 500 pounds each. This small crop sold at a much better price than in 1914, and consequently the acreage planted in 1916 increased to about 7,000 acres. A crop of about 4,000 bales is anticipated this year. The improvement in methods of production which is taking place as the farmers of Salt River Valley become better acquainted with this crop will probably result in larger average yields per acre than have previously been obtained. * * * In view of the strong demand for the type of cotton (Sakellarides) with which the Arizona product is most nearly in competition, the prospects for the permanent establishment of the Egyptian cotton industry in that state are better than ever.

EMBARGO ON YARNS FROM SEA ISLAND COTTON.

On February 23 the British Cotton Export Committee issued a notification to the Manchester Chamber of Commerce announcing that it will not in the future recommend the issue of licenses for the export of cotton yarns made from Sea Island cotton.

The Manufacture of Klingerit Steam Packing.

The advent of high steam pressures created a demand for packing of special composition that would withstand the extremely high temperature and unusual steam pressures resulting from this radical change in steam engineering. The ordinary rubber sheet packing was characteristically unfitted to resist steam pressures of 180 pounds and temperatures varying from 180 to 185 degrees C. A reliable heat resisting steam packing was therefore a prime necessity and German ingenuity promptly attacked the problem of evolving a new packing material. A composition consisting of asbestos, rubber and certain

mineral fillers, such as china clay, barytes, infusorial earth and hydro-cellulose was found to be very satisfactory. The rubber content, however, was comparatively small, as its province in this instance is principally that of a cement.

The first compressed asbestos sheet packing offered to the trade was manufactured by R.

Klinger at Gumpoldskirchen near Vienna, Austria, and known as "Klingerit." This new material was successful almost from the start and the large demand that soon

FIG. 1.—WERNER & PFLEIDERER'S MIXER.

followed grew in volume until it became worldwide. It was not long before aggressive competition appeared and similar compositions were manufactured and sold under the trade names, Moorit, Mezelerit, and Cooperit. The name "Itplatte" was subsequently protected by Gustav Adolph, of Biebrich, Wiesbaden, Germany.

The United States' trade in asbestos sheet packing that rapidly grew to large proportions was for the greater part monopolized by the German manufacturers who were able to undersell their competitors in this country. Since the war has effectively closed this source of supply the demand has been supplied by American manufacturers, and the following brief description of machines used in the manufacture of Klingerit will therefore be of interest.

The crude asbestos is first treated in a machine of the type known as a Chili mill, which separates the impurities and felts the fibers together. The asbestos material is then passed through a carding machine provided with a belt conveyor that carries away the carded fiber in the form of a light fluff. The preparation of the rubber is in no way different from that of making ordinary cement, the washed and dried rubber being placed in a power driven churn and sufficient benzene or naphtha added to make a thin solution. The compounding ingredients consisting of heavy calcined magnesia, oxide of iron and sulphur are then added to the rubber solution and the whole is thoroughly mixed

for about 2 hours in a Werner and Pfeleiderer enclosed mixer shown in Figure 1. Finally the carded asbestos fiber is slowly fed into the same machine and worked up with the other materials into a homogeneous mass.

The sheets are then built up on the Hauboldt mill shown in Figure 2. This machine is designed on the principle that a comparatively small roll operating against one of large diameter, and both revolving at equal surface speed, will exert a greater pressure on the material than two rolls of the same diameter.

This machine has very heavy frames *A* and *B* supporting the rolls *C* and *D*, that are operated by double faced spur gears *E* and *F*, the circumference of the large roller determining the length of the sheet. The small roll *C* is adjustable and driven from the main driving shaft by the large spur gear *G*. The counterweights *H*, *H* hold a stripping knife against the surface of the small roll to keep it smooth and clean. The large roll *D* is hollow and provided with steam and water connections for heating and cooling purposes, while movable gages determine the width of the sheet.

In operation, the small pressure roll is adjusted to the desired thickness of the sheet and the warm dough is evenly applied to the large roll in convenient sized balls or chunks in a manner similar to that used in calendering. A very thin sheet is thus formed on the large roll in the form of a jacket which after being rolled down to size is coated with a special rubber solution containing the distinctive coloring matter. Dough is again applied to the large roll and the second sheet rolled down on the first one and solutioned. This operation is repeated until the desired thickness has been attained, when the built-up sheet is cut transversely and removed from the roll.

Sheets up to 6½ feet wide, 9½ feet long and about ¼ inch thick may be made on this machine.

The solvent recovery apparatus shown in Figure 3, consists of a water-cooled casing surrounding the rolls and provided with an opening of sufficient size to permit material being fed to the

FIG. 2.—HAUBOLDT'S ITPLATE MILL.

machine. A spray of water from pipes located inside of the casing creates a downward circulation of air and naphtha vapor

which is condensed and flows on the water through the connecting pipe to a receptacle on the right where the condensed solvent is separated and drawn off.

The finishing operation of standard sheets consists in applying a cover coating of a colored rubber solution to both sides of the sheets and passing them between the rolls of a two-roll

FIG. 3.—SOLVENT RECOVERY APPARATUS.

vertical calender. Klingerit boards of different gage are made on the same machine by doubling sheets of predetermined thickness.

It frequently occurs that the sheets made on the rolling machine or calender are spotted with dark stains or imperfectly laminated. The machine shown in Figure 4 was therefore designed and found very satisfactory in turning out perfectly finished boards.

It comprises two solid side frames supporting between them a heavy bed-plate or table on which the sheets are placed. A heavy polished, chilled iron roller is journaled in a movable carriage that traverses the table in both directions, driven by a reversible lead screw, the movement of which is controlled by straight and crossed belt-driven pulleys. A sheet is placed on the table and the weighted roller is passed back and forward over the surface several times. It is then turned in a horizontal plane and the rolling continued, after which the sheet is reversed and the other side treated in the same manner.

Standard Klingerit boards are 3.75 millimeters (about $\frac{1}{8}$ inch) in thickness, being built up with 15 thin layers that are .25 millimeters thick. They are blue, reddish-brown, or green in color and the dimensions are as follows:

Millimeters.	Equivalent Inches.
2000 x 2000	78.7 x 78.7
2500 x 2500	98.4 x 98.4
2000 x 3000	87.7 x 118
3000 x 3000	118 x 118
1250 x 4000	49.2 x 157.4
1600 x 6200	62.9 x 244

"It" material is made only in unvulcanized sheets from which the various shaped packings are cut or stamped, the contained rubber being vulcanized after the joint has been made by the heat of the steam. For special purposes metal gauze or tin-foil is placed between the sheets or they may be coated with graphite, the object being to prevent vulcanization. Attention is particu-

FIG. 4.—ARNDT'S SHEET ROLLING MACHINE.

larly called to the fact that Klingerit packings should be kept in a cool dry place, otherwise they will become hard and lose their flexibility.

NEW USES OF SPONGE RUBBER.

BECAUSE of its cellular structure, sponge rubber has several very peculiar properties. For example, it has the lowest apparent specific gravity of all solid bodies, being around 0.05. In spite of its cellular structure it is water-tight, and very nearly gas-tight. While it is honeycombed with minute cells, each cell is an individual unit and the rate of diffusion of gases through it is comparatively low. Because of its low specific gravity it has a very low specific volume, which thus brings its cost within range for common purposes. Perhaps one of the most important uses to which it has been put is in the preparation of life preservers. It will not waterlog, is light, conforms easily to the lines of the body, and is not to be ruined by a pin prick. A life raft made with sponge rubber is as near fool-proof as one can be. Buoys, markers, etc., may be improved by its use.

For some time the brains and time of many men have been occupied in a search for a substitute or modification of the pneumatic tire for automobiles. We have seen about everything, from metal springs to tires made with the regular tire casing but containing a solid block of gum used as a bumper. The season of tire fillers occupies now only a page in the history of this search. Springs have been discarded because of their slowness to respond, and it has been decided by the great majority of automobile owners that nothing rides as easy as air, and rather than use tire fillers they would substitute solid tires.

Two serious objections to most tire fillers are that under constant running they tend to heat up, and finally to decompose, and, second, there is quite a tendency to form flat spots.

As has been mentioned, the most satisfactory tire filler to date is air. This air is customarily held in an inner tube under moderate pressure. It is now proposed to use sponge rubber molded to fit the inside of the tire casing, and in this manner produce a puncture-proof tire. The car still rides on air, but this air is confined in innumerable little sacks. The conditions necessary for a satisfactory tire filler are as follows:

1. It must be quite stable and so constructed that fatigue is reduced to a minimum.
2. It must be light.
3. The driving power must be transmitted elastically.

Sponge rubber fulfills all these conditions. Tires filled with this material were driven 1,950 miles, with an average speed of 35 miles per hour, without any deterioration of the filler.

As would be expected, the cellular nature of sponge gives it great insulating properties, both in respect to heat and sound. It is proposed to use the material for the construction of sound-proof rooms, telephone booths, under musical instruments, and under vibrating and hammering machines, etc. It is proposed also for clothing for aeronauts and arctic explorers.

So far we have spoken only of soft sponge rubber. Hard sponge rubber is also available. It is prepared from soft sponge by further vulcanization. It is understood that the soft sponge is secured by properly regulating the time and temperature of the cure. The stock is made up with sufficient sulphur to effect the transformation to ebonite, so that after producing soft rubber further vulcanization takes it over to hard sponge.

This material has an apparent specific gravity of 0.2 to 0.065, which is $\frac{1}{2}$ to $\frac{1}{6}$ that of cork, and $\frac{1}{4}$ to $\frac{1}{12}$ that of wood. It may be worked in any way customary with hard rubber, such as sawing, boring, machining, etc. It still has the cellular structure of soft sponge, and therefore its insulating properties are not in the least affected. However, it is now not so susceptible to temperature change, and will stand temperatures up to 130 degrees C. It is recommended for icebox walls, covering for flasks, and other insulation problems.

Hard sponge has considerable strength, and has been proposed as a material for the framework of aeroplanes. It has also been recommended as a material for constructing automobile bodies. [Andrew H. King in "Metallurgical and Chemical Engineering."]

TIRE FILLERS AND PUNCTURE FLUIDS.

THE use of tire fillers is not generally encouraged by rubber manufacturers. They contend that a tire casing filled with a substance possessing a "rubber-like resiliency" is virtually a solid tire and would better be made wholly of rubber.

Puncture fluids are also discouraged as being an evasion of the well-known fact that the most effective medium for repairing rubber is rubber itself. Moreover, the reclaiming of tires containing puncture fluids is troublesome and expensive.

The European war, however, has created unusual conditions that demand continuous and exceedingly severe tire service until both casings and tubes are entirely worn out. At the front both the Allies and the Central Powers are using tire fillers through obvious necessity rather than choice. For this reason the following brief review of the representative types of fillers and puncture fluids is timely.

Tire fillers are of three kinds. The first is a liquid to be injected into the tire, where it subsequently solidifies, forming a cushion substitute for air. The second consists of porous rubber compound molded in sections conforming in size and shape to the casing in which it is to be inserted. The third is a viscous puncture fluid that flows over and coats the inner surface of the tube.

A tire filler of the first type consists of a heavy fluid which is either forced directly into the casing or pumped into the inner tube through the valve, where it soon solidifies into a resilient, rubber-like body. "Rubberine" belongs to this first class and is a semi-fluid filler, to be pumped directly into the casing, which it distends to the required pressure according to the weight of the car and then solidifies into an elastic body. Inner tubes are thus dispensed with and the tire requires no more attention until thin or completely worn out. This is an English preparation which is being used with considerable success in military service where the ordinary tire has proved undependable under extreme road stress and gun fire.

"Newmastic" is of American origin and representative of that class of fillers which are pumped into and completely fill the inner tube at the proper operating pressure. With this filler the casings should be new, but old inner tubes may be used. Should

in the casing in sections, end to end, after which the tire is applied to the rims of the wheel by means of a special tool provided for the purpose.

Zuber's patent solid filler consists of molded blocks of sponge rubber, the ends of which overlap when fitted within the casing. Closed air chambers in each block provide additional resiliency.

The third class, puncture fluids, is of value chiefly for bicycle and motorcycle tires. It embraces those mucilaginous preparations, rarely compounded of rubber, which hold in suspension solids or fibers, such as whiting, graphite or asbestos, and which

"RUBBERINE" TIRE FILLING PLANT.

harden instantly upon exposure to air. Enough of the liquid is pumped into the tube under pressure to coat its inner surface with a thin layer occupying only about five per cent of its volume. This viscous compound is evenly distributed by rotation of the wheel, and in case of a puncture is at once forced into the hole by air pressure, where the minute obstructions in suspension form a clot and facilitate immediate hardening of the compound into a permanent plug. "Bale's Puncture Plugger," "Neverleak" and "Tire Treat" are among the well-known fillers of this class.

While puncture fluids take care of ordinary tack and nail holes, large cuts and blow-outs still require patching and vulcanizing, which are less easily accomplished after employing some of the preparations on the market. "Cyclo," however, is said to be made of vegetable gums which do not interfere with vulcanizing and which preserve the rubber. The same is claimed for the "Glins' Liquid Rubber."

"Permanit," an imported preparation, occupies a unique position in this class. It comes in the form of a powder, eight ounces of which is pumped into each tube. One and one-half ounces of water is then injected and the wheel rotated slowly 10 to 20 times, in order to distribute the powder thoroughly. "Permanit" is neither soluble in water nor does it become a paste, glue or fluid, but when a puncture occurs and the powder comes in contact with the outer air a chemical reaction takes place whereby the injured part is instantly healed. One treatment will last at least a year, and a tube can be vulcanized with the powder in it should a blow-out make that necessary.

RUBBER BELTING AND OTHER SUBSTITUTES FOR SOLE LEATHER.

Owing to the high cost of leather, English manufacturers are using substitutes for both uppers and soles of the shoes, some of which are furnished to the troops. Linen duck coated with a mixture of wood tar, pitch, turpentine oil, cork powder and rubber cement are joined together in several thicknesses, compressed between powerful rollers and then cut into soles. The material can be easily sewn and pegged, and seems to serve its purpose admirably.

This is not a new idea. Some shoe finders in this country have for years been purchasing scrap rubber belting and cutting it into half soles to sell to shoe repairers, who find that such soles wear admirably, especially in mining districts.

"NEWMASTIC" TIRE FILLING PLANT.

the casing stretch excessively under severe usage it may be hardened by pumping a small quantity of the liquid into the tire.

To the second class of tire fillers belong those which are first molded from sponge rubber stock to fit the various casings on the market and when inserted simulate the effect of an inflated inner tube. The "National" filler is one of this type, and is placed

What the Rubber Chemists Are Doing.

COEFFICIENT OF VULCANIZATION AS A CHECK ON THE STATE OF CURE.

DR. O. de Vries, Director of the Central Rubber Station at Buitenzorg, Java, publishes in "The India Rubber Journal" (January 20, 1917) a paper in which he presents proof "That the chemical process of the combination of rubber and sulphur is in itself quite independent of the physical one determining the position of the stress-strain curve."

Following is his presentation in condensed form:

The large differences in coefficient of vulcanization, noted by Schidrowitz and Goldsborough, are not found by Dr. de Vries in actual vulcanization practice, who points out that the percentage of combined sulphur does not increase at temperatures below 80 degrees C. On the other hand, the curve shifts its position even at ordinary temperatures, as shown by plotting the figures for the heating points after different lengths of time. These points are demonstrated by several series of experiments. The first, in which a number of samples of the same crêpe rubber were vulcanized together but tested at different times, shows only small changes in the coefficient of vulcanization, the percentage of combined sulphur not increasing perceptibly. The position of the curve (length at load of 1.30 kilograms) changes a total of 42 per cent in length and in this case carries with it practically no difference in coefficient of vulcanization. The same effect is reached by keeping a vulcanized sample for a longer time. It is not necessary to make experiments for many months at the ordinary temperatures, a few days at 70 to 75 degrees C. have the same effect. The curve proceeds lower down on the paper, just as it does when the time of cure is lengthened, but the percentage of combined sulphur remains the same. From these experiments it is clear that the reaction between sulphur and rubber, and the changes in the rubber-sulphur mixture which determine the mechanical properties as expressed by the stress-strain curve, are two different processes, which may proceed independently, and that, in general it is not feasible to make deductions from one regarding the other. It may be assumed that the mechanical properties are more important, and that the curve is a better gage to judge of the properties of the cured rubber than the chemical condition as expressed by the coefficient of vulcanization.

METHODS OF ANALYSIS.

NITROGEN IN RUBBER.

B. J. EATON and F. W. F. Day, in the "Agricultural Bulletin," Federated Malay States, August, 1916, describe their investigations on the distribution of nitrogen in coagulum and serum of *Hevea* latex. One hundred parts by weight of latex yielded 67 parts of wet coagulum and 33 parts of serum, the coagulum being lifted from the pan and allowed to drain for a short time before weighing.

Following are the weight percentages of nitrogen contents of the various portions: latex, 0.11; wet coagulum, 0.15; serum, 0.06.

The nitrogen content of the serum, which was contained in a tall, covered cylinder, fell after 14 days to 0.04 per cent, and after 60 days to an average of 0.03 per cent, after which no further loss appeared to take place.

One hundred parts, by weight of latex, yielded 67 parts by weight of unpressed coagulum or slab, and this on hand rolling was reduced to 50 parts by weight containing 0.26 per cent of nitrogen, equivalent to 0.78 per cent of nitrogen calculated on dry material.

Samples of similar coagulum were converted to sheet and crêpe on the day following coagulation with the following results:

One hundred parts, by weight of latex, yielded 19.7 parts of wet sheet containing 0.30 per cent nitrogen, equivalent to 0.35 per cent calculated on dry weight, which on drying was reduced to 16.9 parts of sheet containing 0.38 per cent nitrogen. Also, 100 parts, by weight of latex, yielded 21.3 parts of wet crêpe containing 0.30 per cent nitrogen, equivalent to 0.38 per cent of nitrogen calculated on dry material. This on drying was reduced to 16.9 parts of dry crêpe containing 0.40 per cent nitrogen.

Thus the nitrogen content of the dry sheet is only slightly lower than that of the dry crêpe. It was observed that the nitrogen content of the sheet and crêpe is about twice as great as that of coagulum left unpressed for a period of six weeks and then washed and crêped, and nearly twice as great as that calculated for the dry coagulum after keeping, showing that little or no alteration of nitrogenous constituents of the rubber has been effected in the sheet and crêpe, causing the formation of nitrogenous substances soluble in water or gaseous loss of nitrogen in any form.

METHODS OF TEST.

PHYSICAL TESTING OF RUBBER MATERIALS.

THE following methods are standard for the physical examination of vulcanized rubber goods as specified by the Board of Estimate and Apportionment of New York City.

SAMPLING. The contracting department shall select and take all samples for testing. The number of samples and the quantity to be taken from the deliveries will depend upon the size of the articles and the quantity delivered.

Samples shall fairly represent the delivery, and pieces shall be taken from not less than one per cent of the number of units delivered.

AVERAGES. The results of tensile strength, elongation and set tests as reported, shall be the average obtained from the samples received by the laboratory. Not less than three test pieces from each sample shall be tested and their results taken in calculating the average unless some individual result is apparently in error, in which case a retest shall be made.

TEMPERATURE OF TESTING ROOM. Physical tests of rubber shall be made with the temperature of the air not lower than 65 or higher than 90 degrees F.

TIME. All measurements of time shall be taken with an accurate stop watch.

PREPARATION OF TEST PIECES.

Test pieces of rubber shall be stamped out with a die, whenever practicable to do so.

TENSILE STRENGTH, ELONGATION AND SET TEST PIECES. Test pieces of rubber for tensile strength, elongation and set tests shall be cut out with a die, either of the constricted bar or ring type. The same test piece shall be used for making all three tests. When the bar test piece is prepared a die should be used that will make the constricted part of such a width that the cross section will be approximately one thirty-second of a square inch.

All pieces for these tests shall have the backing entirely removed, and any corrugations or irregularities of any kind shall be accurately buffed off to make a uniform smooth surface.

Test pieces which have become burnt in buffing shall be discarded.

Test pieces shall be kept constantly wet during the buffing.

Test pieces of rubber valves and odd-shaped rubber articles shall whenever possible be cut down on a lathe to an even thickness of not more than one-eighth inch and then cut out to shape for testing with a die.

If it is necessary to use naphtha to remove the backing or to separate the rubber from the plies, the naphtha shall be what is technically known as 70-degree Baumé, free from oil.

When naphtha has been used the test pieces shall be allowed to remain at rest for not less than one hour before testing.

In all cases where backing is removed and buffing done, the test pieces shall remain at rest for not less than ten minutes before testing.

FRICTION TEST PIECES. Test pieces for friction or adhesion tests shall be cut and prepared as follows:

All kinds of hose, round packing and similar articles shall be cut transversely unless the diameter is so small that a practical measurement cannot be taken, in which case the test pieces shall be cut longitudinally.

Belting, packing or gasket material may be cut in any direction.

Test pieces from washers, ferrules (sleeves) molded gaskets and other odd-shaped articles shall be prepared in the manner called for in the unit specification, if it is impracticable to prepare them in accordance with these rules.

Cotton rubber-lined hose test pieces and braided hose test pieces shall be accurately cut transversely two inches wide and full length of the circumference. They shall be cut through the walls so that they can be laid out flat the full length of the piece. One-quarter inch of the rubber lining shall be carefully and cleanly trimmed off on each side, without injuring the fabric, leaving a strip of rubber lining one and one-half inches wide undisturbed on a strip of cover two inches wide. A separation between lining and cover of this strip shall be started for about one and one-half inches.

Test pieces of wrapped hose, round packing and similar articles shall be accurately cut transversely one inch wide, and left circular, to permit sliding on to a mandrel. A separation between the rubber and the fabric or between the layers in accordance with the test to be made shall be started full width of the piece and far enough distant to permit proper fastening of clamps or hooks, as the case may be.

Solid round packing and similar articles shall have a core drilled out for the mandrel.

Fabric-backed rubber packing test pieces shall be prepared in the same manner as for cotton rubber-lined hose, except that if the rubber part is more than one-eighth inch thick, the test piece shall be prepared exactly opposite, leaving a strip of sheeting one and one-half inches wide on a strip of rubber two inches wide. A separation between sheeting and rubber shall be started for about one and one-half inches.

Belting test pieces shall be accurately cut one inch wide and shall be stripped down to all but two plies, and a separation of the two plies started for about one and one-half inches.

All pieces of flat material such as packing gasket, belting, etc., shall be cut not less than 12 inches long whenever possible.

DETERMINATION OF TENSILE STRENGTH.

The determination of tensile strength of the rubber compound shall be made as follows:

APPARATUS. All tensile strength tests shall be made on an apparatus the general design of which conforms to the Schopper machine.

GRIPS. When bar test pieces are used, the grips for holding the test pieces shall be such that they will tighten automatically, exerting a uniform pressure proportionate to the applied tension across the full width of the piece, regardless of any variation in the thickness of the rubber.

RING TEST PIECES. These shall be placed over the revolving rollers of the Schopper machine.

MARKING BAR TEST PIECE. The bar test pieces shall be stamped in center portion with two lines two inches apart, using a rubber ink pad stamp. The distance between the outside edges of these stamped lines shall be accurate to one one-hundredth of an inch.

MEASUREMENT OF BAR TEST PIECE. The width and thickness of the test pieces shall be accurately determined at three points equidistant between the marks, a spring gage or ratchet stop micrometer being used.

MEASUREMENT OF RING TEST PIECE. The width and thickness of the test ring shall be accurately determined at not less than four opposite points on the ring, care being taken to get the minimum cross section as near as possible, the area of which shall be used in computing the tensile strength.

BREAKING. Bar test pieces shall be tightly fastened in the jaws and brought just taut. The machine shall then be started and the speed so regulated throughout the entire test, that the jaws separate at the uniform rate of 20 inches per minute.

The number of pounds necessary to break the test piece shall be read to the nearest tenth of a pound and computed to pounds per square inch, using the measurements nearest to the break.

When breaking the ring test piece the ring shall be slipped over the revolving bearing provided for it and the procedure continued exactly as for the bar test piece, the speed being so regulated that it will give an equivalent elongation of test piece per minute.

TENSILE STRENGTH ACROSS THE SEAM.

Bar and ring test pieces shall be prepared as usual, except that the seam shall not be buffed off.

In cutting, the seam shall be centered in the middle of the bar test piece, at right angles to the axis, as nearly as possible.

The center of the seam shall be made to lie along a diameter of the ring test piece as nearly as possible.

The calculation shall be based on the average cross section in both kinds of test pieces in the usual manner, but excluding the cross section of the seam or seams.

ELONGATION AT THE BREAKING POINT.

The elongation at the breaking point shall be accurately determined during the tensile strength test as follows:

On the bar test a rule graduated to hundredths of an inch shall be kept opposite the two marks and the distance the outside edges of these two marks are apart at the instant of breaking shall be noted.

This distance shall be computed into per cent of elongation, i. e., if the marks are twelve inches apart at the break, that piece would have 500 per cent elongation.

RING TEST PIECES. These shall have the elongation read to the nearest whole per cent from the automatic record on the stretch tapes.

DETERMINATION OF SET.

The determination of set shall be on the test piece as broken in the tensile strength test not less than one nor more than one and one-half minutes after breaking. Time shall be taken with a stop watch.

BAR TEST PIECES shall have the distance from the outside of the line to the furthest broken point measured carefully along the axis on one broken portion to the nearest one-hundredth inch, and in the same manner from the corresponding nearest broken point on the other portion. The sum of these two measurements, minus two inches, is the actual set, and shall be computed to percentage of the elongation at rupture to the nearest tenth per cent.

RING TEST PIECES shall have the inner circumference carefully measured around a solid disk of the same diameter as the inside diameter of the original ring. The increase in length (actual set) is read to the nearest half per cent, divided by the per cent elongation at rupture, and the result recorded to the nearest tenth per cent.

DEFECTS.

If the break occurs outside the gage marks on the bar test piece during the tensile strength test, the specimen shall be considered as defective for any determination, and another test made.

The broken surfaces of both test bars and test rings shall be examined for flaws or defects, and if the results of the tests confirm the observation of flaws the test pieces shall be replaced by others.

(To be continued.)

CHEMICAL PATENTS.

THE UNITED STATES.

INSULATING COMPOSITION. A phenolic condensation product, initially fluid, transformable by heat without substantial change of volume into a homogeneous, impervious, and infusible solid of high insulating value. [Leo H. Bakeland, Yonkers, New York, assignor to General Bakelite Co., New York City. United States patent No. 1,213,144.]

PROCESS FOR RECOVERING RUBBER WASTE. The process of recovering rubber waste containing fibrous material, which comprises dividing the waste into small particles, disintegrating the fibrous material by treatment with acid, neutralizing the acid with a suitable base of an alkaline earth (in excess), working the resultant solid and liquid components into a homogeneous mass, and then adding a devulcanizing agent and a saponifiable oil. [Richard F. Kinsley, East Cleveland, John D. Morton, Lakewood, and Charles R. Haynes, Cleveland, assignors to Mechanical Rubber Co., Cleveland, all in Ohio. United States patent No. 1,215,941.]

TIRE FILLING COMPOSITION. A composition of the following ingredients: China wood oil, 72 per cent; chloride of sulphur, 8 per cent; oxide of magnesium, 7 per cent; comminuted cork, 13 per cent. [Clarence C. Turner, assignor to John A. Schmidtke—both of Portland, Oregon. United States patent No. 1,216,249.]

THE DOMINION OF CANADA.

VULCANIZED RUBBER ARTICLE. Vulcanized rubber having the structural characteristics of partially broken down rubber. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of Claude D. Mason, Naugatuck, Connecticut, Canadian patent No. 172,568.]

VULCANIZED RUBBER PROCESS. Method of making vulcanized rubber by partially breaking down crude rubber to a sheet form with rugose structure and appearance and vulcanizing the sheet in such condition. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of Claude D. Mason, Naugatuck, Connecticut. Canadian patent No. 172,569.]

RECLAIMING RUBBER WASTE. The process of reclaiming rubber waste containing lead and sulphur by adding a soluble reactive substance to the waste adapted to produce light-colored, water-insoluble compounds with the lead and sulphur. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of Harold R. Murdock, Naugatuck, Connecticut. Canadian patent No. 172,570.]

VULCANIZING PROCESS. A new composition of vulcanized rubber free from lead sulphide and containing lead sulphate and zinc sulphide. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of Harold R. Murdock, Naugatuck, Connecticut. Canadian patent No. 172,571.]

RECLAIMING RUBBER. In a process for the disintegration of fibrous cellular material the treatment of such material with a protein in the presence of heat. A reclaimed rubber compound containing decomposition products of albumin, carbohydrates and cellulose. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of Harold R. Murdock, Naugatuck, Connecticut. Canadian patent No. 172,572.]

RECLAIMING RUBBER. A process involving the disintegration of fibrous cellular material, by treatment with a carbohydrate sugar and starch, having a non-fibrous structure and capable of hydrolysis under the conditions of devulcanization, the resulting products of which decompose the fibrous material. [Canadian Consolidated Rubber Co., Limited, Montreal, Quebec,

assignee of Harold R. Murdock, Naugatuck, Connecticut. Canadian patent No. 172,573.]

THE UNITED KINGDOM.

RUBBER COMPOSITION. For solid tires and mechanical goods a composition consisting of Congo rubber, 17; lithopone, 25; sulphur, $2\frac{1}{2}$; glycerin, $\frac{1}{4}$; finely powdered silica, $2\frac{1}{2}$ parts. [A. Nixon, Manchester, England. British patent No. 16,883 (1915).]

FILLING FOR TIRES. A composition consisting of preferably $4\frac{1}{2}$ pounds of glue, 3 pounds of water, 12 pounds of glycerine, 8 ounces of camphor dissolved in alcohol, and 8 ounces of formaldehyde, or its equivalent, is used for filling inner tubes of pneumatic tires. [J. Flint, G. Bolton, and W. A. McLaughlin, Cambera House, Elizabeth street, Sydney, New South Wales, Australia. British patent No. 14,272 (1915).]

LABORATORY APPARATUS.

VISCOSIMETER.

In viscosimeters of the Ostwald type it is customary to immerse the whole apparatus in a medium of high boiling point. The use of a fairly large quantity of some oil or wax, transparent at the temperature of observation, is thereby necessitated.

In the simple instrument devised by Allan Speedy, described in the "Journal of the Society of Chemical Industry," June 15, 1915, all difficulty in reading the marks is avoided by placing them above the surface of the liquid, which, therefore, need not be transparent and of which only a moderate quantity is required.

The instrument consists of a piece of glass tubing drawn out to form a capillary and bent into V shape, as shown in the figure.

The liquid of which the viscosity is to be determined is placed in the viscosimeter, which is clamped vertically in the bath so that the level marks aa' , are just above the surface of the heating liquid. The bath is heated to the required temperature and after a few minutes the levels aa' , are carefully adjusted. By means of a piece of rubber tubing the liquid is then slowly sucked up the left limb of the tube until it passes the level, b . It is then allowed to descend. The time taken to fall from b to c is recorded by a stop watch, and the experiment repeated as a check. It is only the viscosity of the liquid in the capillary tube that counts. Because of the thinness of the tube wall the temperature of the liquid is the same as that of the bath. It should be observed that the column of liquid bc , never reaches the capillary. The level, b' is well above the point where the constriction in the right limb of the tube begins. The time of flow is taken from b to c only, because on approaching a the motion becomes slow and irregular. The constant of the instrument can be obtained by calibrating it with pure phenol or sulphuric acid.

The instrument may conveniently be strapped to a thermometer and suspended in the heating liquid, which is contained in a boiling tube. The cheapness of the apparatus renders it possible to choose from a range of tubes one with a capillary of diameter best suited to the viscosity of the liquid which is to be investigated. The best results are obtained if the time of flow is about one to two minutes at the temperature of observation.

The instrument is well adapted to measuring the viscosity of rubber solutions, oils, solvents and other liquids. Its extreme simplicity, and the increased accuracy due to choice of a suitable capillary, as well as its convenience in use recommends it to all who have measurements of viscosity to make. These instruments are obtainable from Messrs. Townson & Mercer, Limited, Camomile street, London, E. C., England.

ADJUSTABLE HIGH-TEMPERATURE BURNER.

THE illustration shows a high-temperature burner adjustable both as to the air and gas supply, and suitable for use with any gas except acetylene. An important feature in this form of burner is that the flame may be controlled without changing the position of the crucible, due to the fact that the chimney does not move in its adjustment. It is particularly desirable in operations which call for a blast lamp. [E. H. Sargent & Co., Chicago, Illinois.]

THE SHORE SCLEROSCOPE.

The standard scleroscope is now provided with a special hammer for use in testing the rebound of cured rubber, in place of the diamond-pointed hammer used on metals. This instrument is well known all over the world in connection with testing the hardness of metals by measuring the rebound under a definite blow from a hammer raised and released pneumatically from a constant height.

The illustration shows the instrument mounted for testing small specimens. It is easily detachable from its base for operation on a swing arm for testing larger pieces on a bench. It may also be used free hand for testing still larger pieces in any location. [Shore Instrument & Manufacturing Co., New York City.]

CONTROL OF FACTORY OPERATIONS.

In an article on Factory Control and Research ("The Times Trade Supplement," London, December, 1916), Mr. W. A. Williams discusses the functions of the rubber chemist in relation to manufacturing problems. He suggests that laboratory control should be divided into three departments:

A. Dealing with chemical questions other than those concerned with actual operations, including all research work, the investigation of competitors' productions, the improvement of current manufacturing operations and the investigation and perfecting of new lines of manufacture.

B. Dealing with all actual production operation; control of the finished factory production, checking against specification and standard qualities, including control of power plant and steam raising.

C. Dealing with production of compounds for standard factory specifications, and investigation of new compounds.

The latter department should be equipped with a manufacturing plant on a small scale, with which all investigations of running and vulcanizing can be carried out, and where tests can be made, independent of the large-scale factory operations. These under no conditions should be interfered with. Experimental work should be kept entirely out of the factory. It is only when the experiments have been completed and standardized that the operations on a large scale should be adopted.

The functions of departments B and C are in connection with the daily work of the factory, in order to ensure smooth and efficient operation, and reliability of the finished products. Their operations are concerned with the manipulation of the grades of rubber employed in specific classes of articles and with the many other ingredients entering into manufacturing operations.

SCLEROSCOPE AND BALL REBOUND.

Contributed.

THE accompanying chart shows the relative rebound of various qualities of rubber pump valves, solid tires, vulcanite and other ordinary qualities.

The tests were made in connection with a study of pump valves. The Shore Scleroscope was used with a special rubber hammer, having a small flat steel striking face in place of the usual diamond point used in tests on metals.

The ball rebound was obtained from the same rubber samples from which balls were cut, of three-quarter-inch diameter. These were dropped from a height of about 20 times their diameter onto a smooth cast iron base supporting a scale identical with that used in the scleroscope.

The different rubbers used differed widely in specific gravity and composition, but these differences do not influence the agreement of the rebound of the scleroscope and ball method.

The straight line drawn through the plotted readings passes from zero through 100, the rebound of a ball of pure unvulcanized Para rubber, whereas the scleroscope on this material showed 95.

Thus all scleroscope readings may be taken as representing 95 per cent of the height of rebound which could be obtained

with a ball made of the same rubber dropped from a height approximately 15 or 20 times the diameter of the ball.

The numbered plottings correspond to the following descriptive list of samples.

Numbers 1 to 6 inclusive are rather hard but of low elasticity.

All tests were made at 65 to 73 degrees.

LIST OF SAMPLES CHARTED.

New Machines and Appliances.

AUTOMATIC STRENGTH AND ELASTICITY TESTER.

THIS instrument is constructed so that it generates its own power by the use of a weighted carriage, the speed being controlled by an oil filled cylinder. Thus the material to be tested is stretched in a uniform manner during the testing period. It is used for testing yarns, threads and both vulcanized and unvulcanized rubber.

This instrument is made for breaking strengths of from 5 to 3,000 grams or 1-5 of an ounce to 6½ pounds.

To improve the sensitiveness of this instrument its strength scale is made in two parts, one for the fine yarns having a breaking strength of only a few ounces, and the other for the coarser ones. For the latter an additional weight is added to the upper weight lever.

In this apparatus the piston rod is connected with a carriage which holds the lower set screw. To prevent vibrations this carriage glides on rollers along the standard and a special guide bar. This carriage is held in its upper position by a lever and it is in this position that the oil has to be poured into the cylinder, when setting up the instrument. The tests may be made in two ways, viz:

By either fixing a single length of thread, or threads, between the upper and lower screws, or by placing the threads upon a little wheel placed on same pin as the upper screw and tightening the two ends with the lower clamp screw. In the latter case a double length is tested and accordingly the strength result has to be divided in two, since two lengths are tested at one time.

The elasticity in both cases is shown for the single span and this is either in millimeters or inches and fractions and also in per cent directly.

The strength dials are made either in English or metric system of weight. [Alfred Suter, New York City.]

A LARGE MAGNETIC CLUTCH INSTALLATION.

That all rubber mills should be provided with a positive, quick-acting clutch on the mill lines is without question. The danger of operatives being caught in the rolls is ever present, and in case of accident serious injury may be mitigated and the loss of life prevented by an efficient clutch installation. It is, moreover, an important power economy in that it gives gradual acceleration in starting the heavy mill rolls.

The illustration shows a 78-inch C. & H. magnetic clutch, with a capacity of 2,200 horse power at 100 revolutions per minute, that was recently installed in the plant of the Goodyear Tire & Rubber Co., Akron, Ohio. It is said to be the largest clutch of this type in the rubber mill service. The clutch consists of a solid circular steel casting mounted on the mill end of the shaft, having embedded in its periphery a single cylindrical magnetizing coil, the terminals of which are brought out to an ordinary pair of slip rings. Mounted concentrically with the coil and outer periphery is an adjustable friction ring so that the metal faces of the driving and driven member do not come directly in con-

tact with each other. This also serves the purpose of a permanent air-gap in the magnetic circuit. The other member of the clutch, keyed to the driven or rope-pulley side of the shaft through a flexible coupling, consists of a circular steel armature secured to the hub by a flat circular spring plate. When the mag-

netizing coil is energized, this circular armature is drawn towards the driving member of the clutch, the motion along the shaft being accomplished by a slight dishing of the spring plate upon which it is mounted. This particular form of clutch possesses the advantage of instant disconnection in case of interruption of the magnetizing current, and does not require a portion of a revolution for its disengagement. There is no tendency, moreover, for it to either release or to lock itself due to the mechanical forces exerted as it comes up to speed and while it is running at full speed.

There is a slack cable switch mounted in a frame on the right of the clutch connected to a rope and overhead torsion rod, which automatically causes the clutch to disengage in case any of the driving ropes of the main steam engine drive should break. [The Cutler-Hammer Clutch Co., Milwaukee, Wisconsin.]

THE GRUNDY FLEXIBLE INSULATED COUPLING.

Where it is difficult to get the shaft bearings in perfect alignment, or where they are liable to get out of line, the simple and effective device here shown is recommended for connecting the two ends of the shafting. It is constructed of three pieces,

the two outer flanges being of cast iron and the center disk of leather or hard fiber with lugs on each side for transmitting the power to the outside flanges.

The leather lugs are cut on a bias, tapering towards the disk, the cast iron driving flanges being machined with a corresponding taper, which has a tendency to draw the flanges close to the disk, and to cause the leather lugs to receive and transmit the power at their strongest points.

The close connection made possible by this type of coupling,

reduces to a minimum the leverage so objectionable in the ordinary coupling. They are furnished in standard sizes, from $\frac{3}{4}$ to 500 horse power at 100 revolutions per minute. [Charles Bond Co., Philadelphia, Pennsylvania.]

MOTOR-DRIVEN VARIABLE SPEED DRIVE.

Changes in speed are very necessary in a large number of mechanically performed operations in rubber goods manufacture, hence the demand for a progressive or variable speed changing driver. In the larger and more modern mills, calenders are invariably driven by motors provided with effective controllers of the electrical type that provide a wide speed variation. There are, moreover, many machines outside of the calender room where varying speed conditions may be met in a satisfactory manner by a motor-driven speed change device of the type shown in the accompanying illustration.

This device consists essentially of a pair of cone pulleys, over which runs an ordinary leather belt. Under the belt the surface of each cone is built up from conical to cylindrical form by a patented cone pulley transformer. Each consists of a series of tapering leather strips riveted to an endless belt, the strips being so formed as to give a crown like that of an ordinary pulley.

To effect a change of speed these transformers are shifted along the cones, without stopping the machine, by a screw and chain, as the illustration shows.

While they are in contact with a cone they run exactly as if a part of it. The angle of the cones is such that there is no tendency to slip or creep endwise. The belt may be of any desired width up to the full width of the transformers.

These speed changes are furnished complete in vertical or horizontal countershaft types for floor or ceiling attachment, and from 1 to 200 horse power. [The Moore & White Co., Philadelphia, Pennsylvania.]

THE NEWAYGO MECHANICAL SCREEN.

In the preparation of rubber dust and other finely divided products used in the manufacture of hard rubber and composition soles and heels, the mechanical screen plays an important part. In some cases it is necessary to remove the fiber from the rubber. In others, a certain portion of the fabric is retained in the finished product, while in the case of hard rubber grinding, there is no fiber to contend with. These variable conditions and final products are controlled by a mechanical screening process.

The material is first broken down to about $\frac{1}{4}$ to $\frac{1}{2}$ inch on a cracker and then passed through a 42-inch horizontal grinding mill from which it is delivered to a screen that takes out the fiber and the 40-mesh material. The tailings are then passed through a second mill and over a second screen that removes the 40-mesh material and completes the screen operation.

The distribution of the feed over the entire width of the screen cloth is effected by a screw conveyor and an adjustable feed board at the top of the machine. The various products are taken away at the bottom of the screen. These machines are constructed with one, two and three screening surfaces and, therefore, can deliver from one to four products from a single separator.

Practically no power is required to drive them. In fact, 1 horsepower runs the largest size. The capacity is very large as the entire screening surface is in constant use and the meshes are

kept open by mechanical vibration thus allowing the fine material to pass through the screen.

It is practically dust-proof and fire-proof as practically no wood is used in the construction. [Sturtevant Mill Co., Boston, Massachusetts.]

THE WOLF VACUUM STEAM DRYER.

The process of drying reclaimed rubber and the elimination of all moisture in the dry fillers and other materials used in rubber manufacture is of well known importance to the trade. The Wolf vacuum steam dryers are constructed in units and a side elevation of the three-cylinder type is shown herewith. The outer shells of the cylinders are covered with asbestos, while the inner shells are machined and contain spiral conveyors of the rubber type provided with unifying paddles at each flight. Steam is piped to the chambers between the inner and outer shells and an efficient steam trap removes the condensation.

The material to be dried is delivered to the top cylinder in which it is agitated continuously and conveyed in the same manner through the succeeding chambers and finally discharged in a uniformly dried condition. All gears are provided with gear guards and the drive end is supported by outboard bearings. [The Wolf Co., Chambersburg, Pennsylvania.]

SPECIAL MACHINES.

RUBBER AIDS IN UNHAIRING HIDES.

THE removal of hair from hides is an important process in the tanning industry and one that at first thought would not appear to be particularly difficult. Yet when a hide varies in thickness from $\frac{3}{16}$ to $\frac{9}{16}$ of an inch the operation requires considerable skill. For that reason experienced workmen with special knives were formerly thought indispensable in removing the hair without cutting the hides.

When unhairing machines were first used the difficulty of allowing for variations was apparent, the human element being eliminated. Now it appears that rubber is called upon to replace the hand workman's intelligence. Rubber rolls of soft vulcanized

stock, rubber cylinders with air-filled centers and endless, soft rubber bolsters are now in general use.

In operation the hide is passed over the rubber cylinder or

bolster against which it is held by a feed roller. The rubber bed yields to the surface inequalities, while the operating blades completely remove the hair from the hide.

MAKING WEATHER-STRIPS.

One of the many minor lines of manufacture in which rubber forms an important part, is that of the ordinary weather-strip for doors and sashes. Such strips generally utilize only low grade reclaimed stock in the form of rubber-coated thin fabric and light cloth insertion packing. The rubber is combined with

wood or metal strips in the form of an open tubular fold, with the edges held securely in the body of the strip. In making the double edge wood strip, the rubber sheeting is first cut accurately into strips in a slitting machine. The edges are glued and the strips are inserted in grooves in the wooden strips cut to receive the glued edges of the rubber. The most common form of weather-strip is that made by folding the rubber into strips of sheet brass, zinc or copper. This form is inconspicuous when applied and is the only kind adapted to many locations, such as around sashes of railway coaches for excluding dust and preventing vibration. These weather-strips vary in width from $\frac{3}{8}$ to $\frac{7}{8}$ of an inch and are often made in continuous lengths of 100 feet.

The manufacture of weather-strips is accomplished in automatic machines with special dies and folding devices to form the flat metal ribbon around the rubber, with the edges folded in such a manner as to avoid cutting the rubber. After forming the strip the machine automatically punches holes at regular

intervals in the metal for tacking the weather-strip in place.

The machine shown in the illustration takes the metallic strip from a stock roll and folds it over a strip of rubber or other flexible material. The feature of this machine is a die, through which the metal and rubber strips are simultaneously drawn, and which folds the metal over the rubber. *A* is the strip of metal formed in a roll and mounted on the frame of the machine. *B* is a coil of wire which passes through the die and forms the reinforcement for the completed strip. *C* is a roll of rubber of suitable width. These three parts are passed over suitable guides and into the forming die *D*, which folds the metal strip around the wire and clamps the rubber strip. As the metallic strip *A* is unwound from the stock roll it passes under a buffing wheel *E*, being forced up against this wheel by means of a pedal *F*. The strip then passes between rollers *G* and *H* and thence to the guide *I* where it meets the wire and strip of rubber. As the metallic strip passes between rollers *G* and *H*, it is perforated at certain distances apart by means of punches located in the rim of the roller *G*. The three parts pass through the guide *I* and thence through the forming die. As the completed strip emerges from the die, it passes over a varnishing or lacquering device *J*, which covers the metal parts of the strip with a protecting coat. After the first few inches of completed strip is formed, the end is attached to a clamp *K*, which is hooked into a sprocket chain *L* driven in the direction indicated. As soon as a sufficient length of strip is pulled through the die by means of the sprocket chain, or when the end of the chain is reached, the strip is cut off near the die and the clamp is returned and again attached to the new end of the strip, after which power is applied to the chain to force additional stripping through the die. A section of the completed strip formed by this machine is shown at *M*.

MACHINERY PATENTS.

INTERNAL PRESSURE TIRE VULCANIZING MOLD.

UNDER certain conditions the use of steam, air or water as internal pressure producing agents in curing tire casings has resulted in permeation of the structure. This is obviated in the present invention by maintaining the water that fills the casings under hydraulic pressure, while the expansion due to the heat of vulcanization is controlled in a special expansion chamber.

The illustration shows an ordinary press vulcanizer in which are stacked the molds *A* containing the tires to be cured. Previous to bolting down the head, water under pressure is conducted to the individual molds and the compression chamber *B*, and the air in the tires is forced out through valves *C*. The compression chamber being closed, the air cannot escape and is hydraulically compressed in the chamber serving as a cushion that compensates for the expansion of the water in the tires. [Nelson W. McLeod, St. Louis, Missouri, assignor to American Motors Tire Co., Detroit, Michigan. United States patent No. 1,213,224.]

In a previous invention granted to the same inventor and the same assignee, water is compressed in a cylinder provided with a piston and coiled adjustable spring that controls the ex-

pansion of the water during vulcanization. [Nelson W. McLeod, St. Louis, Missouri, assignor to American Motors Tire Co., Detroit, Michigan. United States patent No. 1,213,224.]

IMPROVED HOSE WRAPPING MACHINE.

According to the customary practice in wrapping garden hose prior to curing, the movable roller is lifted by the increasing diameter of the wrapped hose and mandrel. This often results in the exterior of the hose being permanently marked in an objectionable manner when the hose is cured.

Referring to the drawing, which is an end elevation of the improved machine, *A* is the pole and hose supported by rollers *B* and *C*. The cloth wrapper *D* is placed upon the front roller *P*, and water under pressure is admitted to the three cylinders, only one of which is shown at *F*, thereby lowering the roller *G* into contact with the uncured hose. The cam *H* is then brought in contact with the wedge block *I* which maintains the roller *G* in a permanent position. The wrapper is thus wound on the hose between three rollers that are relatively stationary and as the diameter of the wrapping increases the hose is compressed on the pole and retained in this condition during vulcanization. Thus a more solid and compact hose body is produced and one free from all exterior markings or imperfections. [William P. McGeouch, Arlington, Massachusetts, assignor to Boston Woven Hose & Rubber Co., Cambridge, Massachusetts. United States patent No. 1,213,665.]

THE GRIFFITH MECHANICAL STITCHER.

In this machine the operation of stitching or shaping the fabric down around the sides of the core is mechanically and automatically performed in a smooth and even manner.

The drawing shows a side elevation of the machine and the base *A*, that supports the driving mechanism. *B* is a turret that revolves in a vertical plane on opposite sides of which are bolted four co-acting pairs of stitching tools *C*. As each successive pair of tools comes into operative position on each side of the core *D*, it shapes or stitches the fabric further around the core, a revolution of the turret completing the stitching of one fabric ply.

After a certain number of plies have been laid on the core, bead ring applying rolls *E* are brought into position and the bead rings are placed by being fed between the rolls and the revolving core. When the fabric plies are to be trimmed the device *F* is positioned and the cutting effected by the rolling action of the cutters, the requisite pressure being obtained by spring adjustment. The machine thus described is adapted to stitch the fabric plies on the core and under the bead rings, to apply the latter and stitch other plies down to the bead rings. Before the trimming is done the outer layers are stitched around

the bead rings by a pair of disks carried by arms *G*, and operated by treadle *H*. [Richard Griffith, assignor to the Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,212,207.]

SELF-CONTAINED INTERNAL PRESSURE TIRE CORE.

In curing tires when internal pressure is applied from a general source the necessary pipes and couplings and the possibility of leakage are features more or less objectionable. In this invention the gas or vapor under pressure is confined within the core until liberated by the action of a fusible plug.

The core is formed in three hollow sections *A*, *B* and *C*. Sections *A* and *B* are similarly constructed and the description of the former therefore will apply to the latter. The hollow chamber *D* is provided with an inlet valve *E* through which air or gas under pressure is forced; moreover, water may be introduced. The thermostatic valve, *F*, comprises a disk that is fused by the vulcanizing heat, liberating the compressed air or vaporized water which expands the casing forcibly within the mold. [Henry Z. Cobb, Winchester, Massachusetts, assignor to United States Rubber Co., New Brunswick, New Jersey. United States patent No. 1,211,918.]

TIRE CORE WITH NON-METALLIC ANNULAR PADS.

The object in this device is to provide mechanical means whereby the fabric of the tire is stitched or expanded in the vulcanizing mold. The ring core *A* is provided with two lateral annular rings or non-metallic pads *B* and the fabric plies *C* are laid on the core, the beads applied and the casing finished in the usual manner. Before curing, the pads are removed and the casing is placed in the mold, annular parts of which engage the head flanges, forcing them in contact with the core proper. This movement stretches the casing equally from each side wall to the center of the tread, in which condition the casing is vulcanized. [Burgess Darrow, assignor to the Good-year Tire & Rubber Co.—Both of Akron, Ohio. United States patent No. 1,212,457.]

GRAY'S VULCANIZING PRESS.

In a press for vulcanizing molds, pressure is produced by the weight of the upper platen, either by itself or with dead weight placed thereon, the mechanism for raising and lowering being

incapable of producing any downward thrust. In the form shown, the upper platen is moved by a motor *A* through screw-and-nut gear *B*, *B*, the nuts which fit loosely in the steam heated platen *C* being provided with flanges *D*. The motor stop-gear consists of a projection *E* on the platen which trips the lever *G*. Instead of nuts, chains or other flexible means may be employed for raising and lowering the plate. [Christian H. Gray, India Rubber, Gutta Percha & Telegraph Works Co., Silvertown, Essex, England. British patent No. 102,272.]

PROCESS PATENTS.

FRENCH PROCESS FOR RECLAIMING BOTH RUBBER AND FABRIC.

METHOD for integrally removing rubber from the canvas of worn out pneumatic tires. This method permits the complete

recovery of the rubber contained in the cloth which, entirely freed from rubber, may then be used again.

To obtain this result, the rubber scrap is treated with a dissolvent, for instance, xylol, subjected to powerful agitation while at the same time kept at a high temperature.

This agitation is produced by violent ebullition

of the xylol in a vacuum at from 100 to 110 degrees, combined with circulation of the liquid obtained by an arrangement similar to that used in ordinary lye-washing machines.

The drawing shows a sectional elevation of the apparatus which consists of a digester *A* in the bottom of which is arranged a steam coil *B*. This heating can also be effected by means of the

steam jacketed casing. Inside the digester, covered with a movable lid *C*, is a removable basket *D*, provided at the upper part and the center with caps *E*. In this basket is placed the material from which the rubber is to be removed after first being washed.

The upper part of the digester *A* communicates by means of a pipe *F* with a reflux condenser *G*, which returns to the digester the liquid resulting from the condensation of the steam. A tube *H* connects the condenser with an exhausting-pump.

After the cloth has been freed from rubber, it is placed in a washing-machine with cold xylol. This removes the particles of rubber still adhering to the cloth and also the resin and free sulphur.

The impure xylol resulting from this operation may be advantageously employed to swell the rubber in the preliminary treatment of the tires, always, however, after it has been filtered to free it from the particles of rubber. After the cloth has been rinsed in the washing machine, it is put into the basket *D* and this is placed into the digester *A* containing clean xylol.

A vacuum is produced in the digester and heat to about 110 degrees is applied, producing violent ebullition. When the operation is judged to be concluded, the digester is emptied and a second operation begun.

All liquids with which cloth containing rubber in dissolution has been treated after the manner just explained, will still serve to effect the dissolution of rubber particles.

By the above method, the freeing of cloth from the rubber is almost integral; but to obtain a perfect result, a fresh quantity of xylol is added in the digester and the temperature is brought to about 150 degrees under pressure for a certain length of time. When the operation is concluded the cloth is replaced in the washing machine, is washed, rinsed and finally dried in a current of warm and inert gas. [H. Debaugé. French patent No. 481,293 (July 20, 1915).]

A NOVEL TIRE FABRIC CONSTRUCTION.

Under present conditions tire-building strips are cut on the bias from tire fabrics of standard widths, but the length of the strips is relatively short and limited to the width of the fabric.

This invention provides a strip that may be cut lengthwise or transversely of the weave and in width somewhat greater than the transverse circumference of the tire. As seen in the illustration, the longitudinal edges are serrated and the free ends of the flaps are so spaced that when the strip is wound circumferentially around the core and the edges brought down against the sides, the edges of the flaps will meet. When the strip is cut longitudinally of the fabric one length may be used to construct an entire casing. [Robert M. Merriman, Akron, Ohio. United States patent No. 1,213,929.]

New Goods and Specialties.

BATHING CAPS FOR THE COMING SEASON.

THE new bathing caps are more bewitching than ever and at the same time more serviceable. A practical and attractive cap for every bathing purpose is a white tailored diving cap

which is decorated in various ways, the style shown having for its ornament a hand-painted bird in solid color or combinations—a white bird with blue painting, a black bird with red painting, a red bird with black painting, or a plain blue bird.

The all rubber sun hat shown in the second illustration affords protection for the face, is very becoming and consequently appealing to feminine buyers, yet preserves its original intent to protect the hair and ears while in the water, by means of a tightly fitting inner head-band. This cap is ornamented with a large button on top and a ribbon and buckle ornament at the side. It is furnished in black, red, blue and green, with trimming to harmonize.

Another brim hat with an inner head-band is made on strictly tailored lines, in black, red, blue and green, with a ribbon and bow in harmonizing colors. [The Faultless Rubber Co., Ashland, Ohio.]

THE "NO-MAN" TOP FOR AUTOMOBILES.

An engine-operated motor car top recently placed on the market may interest manufacturers of rubberized materials, since it can be made of any material used for car tops. This

top works on the principle of an ordinary roller window shade and can be easily drawn up in place by the driver, without even stopping the car, or lowered and concealed in the specially designed compartment back of the tonneau where it is protected by a waterproof cover which gives the car a finished appearance.

Side curtains are also provided, working on the same principle,

which may be pulled down and fastened at a moment's notice. The illustration shows the position of the "No-Man" top when rolled up in the tonneau. [Automatic Auto Top Co., Chicago, Illinois.]

BAREFOOT SANDAL WITH RUBBER SOLE.

The practical sandal type of footwear has grown increasingly popular for adults as well as children, and the well-built and attractive model here shown is being introduced at an opportune time. It is of high-grade construction on a specially designed last. The uppers are of pure white canvas and the soles of white rubber. This new sandal is supplied in women's, misses' and children's sizes. [Apsley Rubber Co., Hudson, Massachusetts.]

RAINCOAT FOR 1917.

The maker of this smart new model in ladies' raincoats maintains a corps of experts designers and living models to assist in producing superior creations in waterproof clothing. The coat here shown is semi-close fitting, single-breasted, with nine buttons, arranged in groups of three. Its special features are a Prussian collar, yoke and side pleats front and back, fancy cuffs and two side pockets with flaps, lending an air of style and individuality to the garment that makes it suitable for wearing over the daintiest gown, the full length cut giving complete protection. [The B. F. Goodrich Co., Akron, Ohio.]

THE "STIK-TITE" BACK CURTAIN WINDOW.

In the "Stik-Tite" window a fabric strip made of automobile rubber, or whatever fabric is used for the car top, is attached by rubber gum to the transparent celluloid forming the window proper.

This window is applied to the back curtain of the car by the rubber gum and held absolutely secure, without stitching or fasteners of any kind, the whole process being handled in the

same manner as putting a cold patch on an inner tube.

These windows are made in various shapes and sizes, to suit the different makes of cars. They weigh only three ounces, are neat in appearance, and it is claimed that they outwear several old-style windows and also protect and

strengthen the curtain. [The Cincinnati Auto Specialty Co., Cincinnati, Ohio.]

"FLOSSY" DENTAL FLOSS HOLDER.

The use of dental floss is universally recommended by dentists and this newly invented floss holder, made of hard rubber, ebonite or French ivory, is claimed greatly to facilitate the operation of cleaning the interstices between the teeth where no toothbrush can reach, and to act as an economizer in the quantity of floss used. The floss container is held within the circle and the thread attached to each arm of the "Flossy" by being passed around the patented non-slip floss holding means with which the arms are provided. A thread-cutting device is so arranged that the used portion of silk is severed and discarded. In operating this simple little instrument the fingers need not enter the mouth and there are no metal parts to irritate the gums. Each outfit consists of one "Flossy" and a supply of medicated, perfumed, waxed silk dental floss contained in a sanitary rubberoid pocket case. [The Makers of Flossy, Evanston, Chicago, Illinois.]

VIBRATORY MASSAGE OUTFIT AND PHONOGRAPH MOTOR WITH SPONGE RUBBER.

Vibratory massage is a deservedly popular form of treatment for men after shaving or shampooing and for women in connection with facial

and scalp treatments, and a new machine has recently been devised for this purpose whereby a complete motor apparatus may be placed on the back of the operator's hand. The convenience of this portable hand massage machine is readily apparent,

since it weighs only 18 ounces and can easily be carried in the pocket, cord and all. It is held on the hand by two elastic straps, and a block of sponge rubber beneath each strap serves effectually to reduce the jar in the hand and arm of the operator. The machine is wound to operate on any lighting circuit, alternating or direct, 100 to 120 volts, 60 cycle or less, and a speed-regulating rheostat is included with each outfit.

At the end of the vertical motor shaft of the "Shelton" electric talking machine or phonograph motor, also shown, there is a soft rubber wheel which contacts with the edge of the table for driving the motor, in place of the usual hand-operated spring mechanism. [Shelton Electric Co., Fort Wayne, Indiana.]

"B. B. STYLO" FOUNTAIN PEN.

The stylographic pen here shown embodies a radical departure in stylographic construction and is claimed to be admirably adapted to the needs of the modern business public. The "B. B. Stylo" combines a stylographic point with a modern self-filling

fountain pen equipped with fountain pen feed. The old-style inner air tube and leaky ink joint are replaced by the most desirable features of the standard fountain pen, such as a capillary saw for

carrying ink, a modern self-filling device in connection with the rubber sac, and proper feed ventilation. [Bird-Bill Pen Co., New York City.]

FISHING BROGUES AND SAND SHOES.

The stout rubber shoe and slipper, with buckle strap, shown in the accompanying illustration, appeal to the fisherman who knows that wet weather is fish weather, and who seeks a foot-covering suitable for the moist and marshy byways he must tread in pursuit of his finny prey. They are stout and serviceable, yet devoid of clumsiness,

the studded soles preventing danger of slipping. These brogues are made entirely of rubber, or with leather half-soles if desired.

The rubber sand shoe for women, misses and children, also shown, is neatly bound, fastening with a strap and one button. The corrugated heel affords a safe foothold. These are supplied in black, brown, gray and white, with leather insoles if desired. [The North British Rubber Co., Limited, Edinburgh, Scotland.]

LIFE-PRESERVING OUTFIT.

The best diving suit material is utilized in the life preserving outfit here illustrated. It is made in the form of a union suit, covering the feet and hands also and being provided with bands of rubber about the wrists, neck and ankles. The suit is drawn on through an opening in the breast portion and the shoulder portion is drawn over the head, which passes through the soft rubber neck portion, made water-tight by a soft rubber strap. The sleeve of soft rubber forming the opening into the suit is then drawn together by the wearer and doubled, and a strap is wrapped around the folded sleeve, making it absolutely water-tight. Around the body of the suit are cork-filled pockets.

The shoes are weighted with five pounds of lead, to insure an upright position in the water, and the head and shoulders remain out of the water. The head mask, which is used in case of very rough weather to prevent the wearer from being smothered, is provided with ordinary transparent goggles and is tied around the neck with a flexible string.

The entire outfit can be put on in a minute's time, and it is claimed that the wearer will be kept perfectly warm and dry, and that even in case of puncture the suit will still prevent the wearer from sinking. [The Aud Co., Inc., Herndon, Virginia.]

ANTI-DRAFT SHIELD AND AUTO BUCKET.

The upper illustration shows a windshield cap made of 32-ounce enameled rubber duck, designed especially for Ford cars, to fit the space between the windshield and the top of the car through which drafts, rain and snow have access to the driver. The "Powers" Anti-Draft shield is furnished with strong, spring clips which fasten to the wind-shield and

curtain fasteners with eyelets that attach it to the top of the car. This handy accessory is of good appearance and adds greatly to the comfort of motor driving.

"Hinson's" textile auto bucket, also shown, is not merely collapsible but when not in use folds into a neat, flat package which can be put under the car seat or in the tool box and which can be unfolded instantly when required. It is made of khaki waterproofed duck, specially treated, and has a strap handle 15 inches long over the top. This bucket holds about 2 gallons. [The Powers Manufacturing Co., Waterloo, Iowa.]

SHOWING BUCKET IN USE

SHOWING BUCKET WHEN FOLDED

RAIN VISION TRUCK SHIELD.

This sectional view of a rain vision shield specially designed to meet the requirements of commercial cars or trucks shows how the ¼-inch selected Pittsburgh plate glass is set in channel rubber, the frame being of ½ by 7/8-inch steel tubing with 3/8 by 3/8-inch groove, finished in three coats of black enamel, baked on. The hinges are of the friction type, a slight turn of the wing nuts adjusting the upper fold to any angle desired for rain vision or ventilation. These shields are claimed to be practically indestructible and guaranteed not to rattle. They are supplied with or without the filler board in sizes ranging from 25 to 32 inches high and 40½ inches wide. [Banker Wind Shield Co., Pittsburgh, Pennsylvania.]

"RUBBER MILK" SPONGES.

The "rubber-milk" sponge, now being marketed in London under the trade name "Quala," is claimed to be a very different article from the rubber sponges of Continental European and American manufacture, which have from time to time appeared on the market. The "Quala" is made by a wet process direct from the "rubber milk" or latex. It resembles the natural sponge in appearance, and unlike the red rubber sponges, it swells and grows soft in water. Over the natural sponge it is said to have the advantage that it does not clog nor get foul with soap. This "rubber-milk" sponge is to be extensively advertised, and instructions furnished with each sponge advise purchasers before putting the sponge into use, to soak it in hot water for half an hour and then soap it thoroughly and rinse. This treatment restores the "Quala" to its natural color and normal size, which is about one-half larger than in its dry, packed state. The sponge should afterwards be kept moist and should not be exposed to sunlight for any length of time. This "rubber-milk" sponge is made at Brentford, England. [Rubber Sponges, Limited, London, England.]

LIFE PRESERVER FOR ADULT AND CHILD.

The inventor's hand will be seen on the boy's shoulder in the accompanying illustration of a life preserver large enough to admit an adult and child. The boat-shaped frame is covered with waterproof material which is extended in the proper places for the arms and legs. The life preserver is further provided with cork floats, a window for light and observation, and air intake tubes. When closed, it locks and the wearer floats on his back, riding the waves and completely protected from cold and water. [Nick K. Ramos, Lansing, Michigan.]

completely protected from cold and water. [Nick K. Ramos, Lansing, Michigan.]

THE HAMILTON MULTOMETER.

A recording device that accurately indicates the separate mileage of each tire in service and also of the two spare tires is one of the newest accessories to claim the motorist's attention. Moreover, in case of puncture, blowout, or tire replacement, the registering device may be disconnected and the mileage of that particular tire recorded.

It is a speed indicator as well, and indicates trip or season mileage. It also records gasoline mileage (for the season or trip) with mathematical accuracy, and indicates the necessary me-

chanical adjustments, oiling and cleaning requirements, at each 500 and 1,000-mile period.

The Multometer is an accurate instrument and is said to record 13 separate readings that contribute to the economical and efficient operation of the car.

It is operated from a single flexible shaft and mounted in a manner similar to the standard speedometer equipment. The control is exceedingly simple:

Turn the movable dial ring indicated in the illustration so that the reading desired shows on the face of the ring directly opposite the setting knob at the right. Turning the dial ring to the point marked "trip" indication shows mile by mile on the dial. Turn it to the point marked "total" and the total mileage for the season shows up instantly. Turn it to the point indicating any tire on which you desire reading and you get the totals immediately. [The Hamilton Corporation, Lancaster, Pennsylvania.]

The Editor's Book Table.

EXPORT TRADE DIRECTORY. BY B. OLNEY HOUGH. JOHNSTON Export Publishing Co., New York City. [540 pages, cloth, \$5.]

THIS important trade directory comes to us much enlarged over the previous number, containing as it does a gain of more than 50 per cent in many of its principal lists. Export merchants in New York are given to the number of 1,295 in place of less than 800 in the last edition and the San Francisco list shows a gain of more than 20 per cent. The book gives lists of the principal export merchants of the United States, export agents and brokers, the leading bankers engaged in foreign exchange business, marine insurance companies, foreign freight forwarders, the steamship service to foreign ports, consuls of foreign countries in the United States and our consuls in foreign countries, associations for promoting export trade, and several classified lists for quick reference as to goods manufactured or markets cultivated. The book is compiled by B. Olney Hough, editor of the "American Exporter."

COMMERCIAL WOODS OF THE PHILIPPINES: THEIR PREPARATION and Uses. By E. E. Schneider, Bureau of Forestry, Manila, Philippine Islands. [8vo, 274 pages, paper covers, \$1.00.]

This work is intended primarily to furnish woodworkers and users with authentic information concerning the woods of our island possessions in the Far East. There is a concise account of the forests, with a description of each species of wood, its physical and mechanical properties, and the different purposes for which it can be utilized. Quite full and untechnical directions are given for the identification of the trees, and of the wood when cut into lumber. More than half the book is devoted to detailed descriptions of the 360 Philippine woods, with notes on their mechanical properties and workability. Each is given its botanical, and its local name or names, its uses, and approximate prices. It is a book of practical use to those interested in the building and wood-working trades.

THE INDUSTRIAL AND SOCIAL IMPORTANCE OF FORESTRY IN China. By Forsythe Sherfese, Ministry of Agriculture and Commerce, Peking, China. [Small 8vo, 26 pages.]

Forsythe Sherfese, Adviser in Forestry to the Agricultural Department of the Chinese Republic, claims in this paper, which is reprinted from "The Chinese Social and Political Review," that the chief handicap in China's industrial advance is the lack of forests, and consequent scarcity of wood for building, manufacturing purposes and fuel. No other modern country has been so denuded of forests, through heavy rainfalls washing away the soil, and he predicts a condition similar to the Sahara, unless forests are planted. Millions of acres of public lands, unsuited to agriculture but fully capable of supporting forest growth, lie idle and unproductive. To overcome this state of affairs, there was created last year the first Chinese National Forest Service, and this body is inaugurating a comprehensive plan for reforestation in many sections of the country.

FATIGUE STUDY. BY FRANK B. AND LILLIAN M. GILBRETH. Sturgis & Walton Co., New York City. [Small 8vo, 159 pages, illustrated. Price, \$1.50.]

The twentieth century manufacturer aims to find the best workers, and to secure from them their best work. To accomplish the latter is the object of the study which is here described. Every worker, whatever his task, can do better work, and labor effectively for a longer time, if conditions are such that no unnecessary fatigue is induced. This book is devoted to such study. It contains a large amount of practical matter, the result of scientific investigation of two experts, with many definite suggestions and reports of plans which have been worked out in the investigation for eliminating unnecessary fatigue. The book contains a large number of illustrations from photographs taken at the plant

of the New England Butt Co., where these studies have been put to practical use and the results have proven their value. Especially interesting are some of the studies of false motion, where a small electric light has been placed upon the hand and then a photograph made, tracing the motions of the hand as recorded on the photographic plate. These cyclographs and chronographs are worthy of special study. Many other special inventions which have been made by the authors and put to practical use are pictorially recorded, as well as some motion pictures taken each five-hundredth of a minute for the purpose of studying a means of eradicating false motions and fatigue. This book aims to present the problem of fatigue in the industries in its simplest form, and to outline its practical solution.

MOTOR TRUCKS OF AMERICA. VOL. 5. THE B. F. GOODRICH Co., Akron, Ohio. [164 pages, paper covers.]

The truck tire department of The B. F. Goodrich Co., Akron, Ohio, has issued Volume 5 of its excellent work giving full details and specifications of the motor trucks manufactured in this country. Each truck is pictured in an excellent half-tone, and the various specifications as to model, capacity, price, the dimensions of the motor, the wheelbase, and the tires, as well as every other item regarding external and internal construction. More than 120 different trucks are thus fully described. There is also a finely illustrated article entitled "Lengthening the Life of the Motor Truck" and other information of value to every owner, user and repairer of such vehicles. At the end of the book are bound in, four printed and directed postcards which may be detached and sent, requesting further publications of that company.

NEW TRADE PUBLICATIONS.

THE DAVOL RUBBER CO., Providence, Rhode Island, is distributing a very neat little catalog and price-list of fountain syringes, water bottles and similar goods, handsomely printed, with the various lines pictured in the vivid colors of the goods themselves, the illustrations occupying the right-hand pages, the description and prices on the pages opposite. It is at once compact and comprehensive, and should bring business.

* * *

The Thermoid Rubber Co., Trenton, New Jersey, sends us a finely printed catalog of its automobile products, including tires, inner tubes, brake linings of various types, clutch facings and disks, fan belts, bumpers, pedal pads, pump tubing, and various styles and qualities of hose, besides miscellaneous accessories for automobiles. Half-tone illustrations are profusely scattered through the book, giving excellent ideas of the goods listed. A bird's-eye view of the plant decorates the title page.

* * *

"Science Progress," the well-known English quarterly, (John Murray, Albermarle street, London) has sent this office the July 16, 1916, number, which contains an able and interesting "Historical Sketch of the Chemistry of Rubber," by S. C. Bradford, B.Sc., of the Science Museum, South Kensington, London. In less than a dozen octavo pages, Professor Bradford has collected a host of facts, historical and chemical, including those regarding the successful production of synthetic rubber, reviewing succinctly the experiments and researches from Hancock, in the early '40s, to Matthews and Bayer during the present decade.

* * *

The Fisher Governor Co., Marshalltown, Iowa, sends out a fine line of "bulletins" which are arranged to form, in the self binder furnished, a full catalog of the pump governors, reducing valves, exhaust and relief valves, pressure regulating devices, steam traps and similar mechanisms for use in indus-

trial establishments. These bulletins are finely printed, illustrated with simple diagrams and excellent half-tones, and the descriptive matter clear and concise. In the list of large users of the Fisher specialties are a number of leading rubber manufacturing concerns whose names are familiar to our readers.

* * *

William H. Scheel, 159 Maiden Lane, New York City, importer and distributor of rubber substitutes, rubber workers' supplies, compounding ingredients for rubber and other trades, has issued a buyer's list covering his complete line. Purchasing agents will be supplied with as many copies as they require.

* * *

The Apsley Rubber Co., Hudson, Massachusetts, is sending out a style book which within its 80 pages shows well-executed half-tones of practically every rubber this company manufactures. The footwear which is other than black is printed in its appropriate color. Besides the side views, the shapes of the soles are given and the description of each shows its special features. The cover is printed in blue and gold and, typographically, the pamphlet is most commendable.

Distributed with this is a smaller pamphlet giving the packing schedule, which shows the number of pairs of each size in 12 and 24-pair cases.

THE WORLD'S RUBBER POSITION.

The annual chart showing in graphic form the World's Rubber Position as published by W. H. Rickinson & Son, London, shows in diagram many important facts regarding rubber production, prices and distribution. The wonderful advance in the total production, and the increased yield of plantation rubber and the average prices show the most sensational lines on the chart, but the other diagrams are also interesting. The statistics of plantation rubber are given in columns at the right and left of the chart. They show number of acres in bearing, yield in tons and price per pound. The great expansion of American consumption of rubber, and comparatively small increase in the retention of rubber in Great Britain are especially worthy of attention. In all, the chart is well worth a place in every rubber merchant's and manufacturer's office. This chart is reproduced in greatly reduced form on another page in this issue.

CALENDARS AND SOUVENIRS.

Although the first of the year is the usual time for the distribution of calendars and other souvenirs for advertising purposes, THE INDIA RUBBER WORLD has received quite a number during last month, which are hereby acknowledged.

The Industrial Chemical Co., New York City, has sent out a very useful little affair which combines an 8-inch rule, a calendar for the year and a signature blotter. This is in enameled white metal with several layers of blotting paper on the under side, while the announcement of the company occupies a space between the two groups of six months each giving the calendar for the year.

Those smokers will be delighted who receive from Katzenbach & Bullock Co., New York City, a combined match box, cigar rest and ash tray of bronze finish with a holder of the proper size to contain a box of matches. The latter has upon either side an advertisement of the lines of goods carried by this well-known chemical firm.

One of the most striking calendars received is that of the Buffalo Foundry & Machine Co., Buffalo, New York, which is in the form of a handsome reproduction of Thomas Moran's celebrated painting, "Venice the Golden." The brilliant coloring of this picture and its fine reproduction make it an ornament worthy to adorn any office or home.

For practical advertising F. E. Myers & Bro., Ashland, Ohio, must be commended. Their calendar sheet contains engravings of several hundred varieties of pumps and miscellaneous ma-

chinery in which this firm specializes. The calendar is small and neat and occupies the center of the sheet. At the top is a colored lithograph of a country scene, perhaps a Jack and Jill, the latter using a Myers pump most effectively.

The Firestone Tire & Rubber Co., Akron, Ohio, embellishes its new calendar with a ten-color print of a handsome girl of the American type. The original, the work of Earl Christy, is owned by the Firestone company. The reproduction is a fine example of art printing.

Obalsky & Sweeney, Inc., crude rubber importer, New York City, has distributed to the trade a useful and ornamental souvenir. It is a red leather desk pad of convenient shape for recording memoranda, the paper being supplied from a removable roll enclosed in the top of the pad.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[274.] A correspondent wishes to obtain a small skiving machine for use in making patches.

[275.] Manufacturers of small laboratory roller mills for working up samples of rubber are sought.

[276.] Names and addresses of concerns supplying rubber seed oil have been requested.

[277.] An inquiry has been received for machinery used in the manufacture of tires and inner tubes for automobiles, motorcycles and bicycles.

[278.] A correspondent is interested in the machinery used in repairing tires and in making rubber heels and tennis balls.

[279.] Information is desired regarding zinc substitutes.

[280.] An inquiry has been received for rubber respirators.

[281.] Names of makers of machinery to cut sheet rubber into threads for elastic textiles have been requested.

[282.] Names of manufacturers of rubber pencil tips are desired.

[283.] Full information regarding tire vulcanizing is requested.

[284.] An inquiry has been received for brass hot water bottle stoppers.

[285.] A machine for cutting rubber thread is sought.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Bolivia wishes to be put in touch with American manufacturers and exporters of cheap rubber hair ornaments. Report No. 23,627.

Exclusive agency for the sale of tires is desired by an engineer in Switzerland. Report No. 23,656.

A firm in Bolivia wishes to receive catalogs and full information from American manufacturers and exporters of rubber combs. Report No. 23,659.

Representation of American manufacturers and exporters of pneumatic tires is desired by an applicant in Spain. Report No. 23,666.

Agency is desired in Australia for the sale of elastic fittings for suspenders, etc. Report No. 23,682.

A man in Switzerland desires to purchase erasers and to secure an agency for their sale. Report No. 23,684.

A firm in British East Africa is in the market for canvas and leather shoes with composition and chrome soles. Report No. 23,699.

An applicant in Spain desires to purchase pneumatic tires and automobile supplies. Report No. 23,729.

An Australian business man now in the United States wishes to purchase balata belting. Report No. 23,750.

The Obituary Record.

RICHARD S. SATTERLEE, vice-president of the Habirshaw Electric Cable Co., Inc., of New York City, died at his home in that city February 15, aged 56 years.

Captain Satterlee was born in New York City, June 6, 1860, son of the late George B. and Sarah Satterlee. He was

educated at St. Paul's School in Concord, New Hampshire, and at Holbrook's Military Academy, Ossining, New York, afterwards studying at the College of Physicians and Surgeons, New York City, where, however, he did not complete his course. He served in the Seventh Regiment, New York National Guards, and for several years was engaged in cattle raising on a ranch in Wyoming. After his return to New York City he entered the real estate busi-

CAPT. R. S. SATTERLEE.

ness and was appointed Deputy Tax Commissioner by Mayor Strong, serving four years.

He went around the Horn in a sailing vessel in 1898 and on arriving in San Francisco, California, he heard of the declaration of war with Spain and immediately joined the First New York Volunteers and started for the Philippines. Typhoid fever broke out and the regiment got no further than Honolulu. Later he received a commission as First Lieutenant in the Twelfth New York Infantry, and saw service with this regiment in Cuba. After the Spanish war he became connected with the Habirshaw Wire Co., in which his brother, Hon. Herbert L. Satterlee, was interested. He was president of the company at the time it became associated with the Electric Cable Co., and the name was changed to the Habirshaw Electric Cable Co., Inc., Mr. Satterlee becoming vice-president, a position he retained up to the time of his death.

At the time when it seemed probable that this country would have war with Mexico, Mr. Satterlee offered his services to the State, although he was past military age, and his offer being accepted, he was appointed Captain of Ordnance and attached to the Division Staff.

On the 10th of last month, in company with Major L. Reagan, Division Adjutant, Captain Satterlee began a tour of inspection of the aqueduct at points where guards had been stationed. The long exposure to severe weather caused a sudden illness, which resulted in his death.

Captain Satterlee is survived by his widow, his mother, a sister and a brother.

A WELL-KNOWN RUBBER RECLAIMER.

Samuel Wright, prominently connected with the crude and reclaimed rubber business, died of pneumonia January 18 at his home in Yonkers, New York.

He was born in Conshohocken, Pennsylvania, June 22, 1875,

and after graduation from the Academy of Natural Sciences, Philadelphia, became assistant secretary of the J. Elwood Lee Co., Conshohocken, and in 1911, when the Lee Tire & Rubber Co. was formed, was appointed secretary, resigning about a year ago to become associated with the Philadelphia Rubber Works Co. He was also treasurer and general manager of the Acushnet Process Co., Inc., of New York City, a corporation formed to handle the New York City business of the Acushnet Process Co., of New Bedford, Massachusetts.

Mr. Wright was a thirty-second degree Mason, a Shriner, and a member of the Loyal Legion, the Rubber Association of America, and the Merion Cricket Club of Philadelphia.

HEAD OF THE GERMAN RUBBER MANUFACTURERS.

The death is announced of Louis Hoff, chairman of the Central-Verein Deutscher Kautschuk-Waren Fabriken (German Rubber Manufacturers' Association) since 1904, and general director of the United Harburg-Vienna India Rubber Works. He was also prominently associated with the Kolonial-Wirtschaftlichen Komitee.

LONG PROMINENT IN CRUDE RUBBER TRADE.

Herman Reimers, well known in the crude rubber trade, died at his home, "The Elms," Spaniards' Road, Hampstead Heath, London, England, February 11, in his sixtieth year.

H. REIMERS.

Mr. Reimers was born in Bremen, Germany, and when a young man came to this country in 1876 and was connected with the crude rubber house of Charles Loewenthal & Co., later becoming a member of the firm. He represented the company in Boston, Massachusetts, for several years and when the partnership expired by limitation, December 31, 1891, a new partnership of Reimers & Meyer was formed, afterwards becoming Reimers & Co. In

1902 this firm was succeeded by Poel & Arnold. Mr. Reimers remained out of business for about six years, during which time he made his home at Honnef, Germany, but traveled extensively in Europe, and then he became a partner in the parent house of Heilburt, Symons & Co., London, England, where he remained until the time of his death. He was at one time chairman of the board of the Anglo-French Mercantile and Finance Corporation, Limited, a £1,000,000 corporation for financing, buying and selling rubber plantations, and was director in several rubber plantation companies in the Far East.

Mr. Reimers was of strong personality, a man of exuberant spirits and tremendous vitality. It is said that he had several times been mistaken for Sandow, the wrestler, both on account of his physical build and facial resemblance. He visited the

Amazon rubber regions in 1894, where he tapped trees, gathered latex and smoked the rubber, and he wrote an entertaining account of this which appeared in THE INDIA RUBBER WORLD, June 15, 1894. He had a large acquaintance and a host of friends in the rubber trade, not only in this country but in Europe.

A LEADING RUBBER GOODS DISTRIBUTER.

Warren M. Salisbury, one of the original incorporators of W. H. Salisbury & Co., the well-known rubber distributing concern, Chicago, Illinois, and its first president, died at the Presbyterian Hospital in that city February 5 at the age of 58. The business dates from 1855, and was named for his father, W. H. Salisbury, who was its active head from 1874 until his death in 1902. The business was incorporated in 1904, and is one of the leading houses in the west for the distribution of mechanical rubber goods and leather belting.

Warren M. Salisbury was born in Augusta, Georgia, and came to Chicago in 1877. His entire business life was spent with the above named company, but he was also a director in the W. W. Kimball Piano Co. and the Rockwood Sprinkler Co. of Chicago. He is survived by his widow, and one son, Kimball M. Salisbury.

PROMINENT IN THE TIRE FABRIC INDUSTRY.

William B. Fittz, formerly general manager and secretary of the Connecticut Mills Co., Danielson, Connecticut, died at Brookline, Massachusetts, February 12, aged nearly 61 years.

Mr. Fittz was identified with the textile industry during his entire business life. He was superintendent of the West Boylston Manufacturing Co. at Oakdale, Massachusetts, and it was under his supervision that the entire plant was transferred to Easthampton, Massachusetts, in record time. In October, 1911, he started the Connecticut Mills Co. enterprise at Danielson to manufacture tire fabric. Under his management, the little six-loom mill grew to its present proportions. Meanwhile, he established the Canadian Connecticut Cotton Mills, Limited, at Sherbrooke, Quebec, to supply the Canadian demand for the company's product. Mr. Fittz resigned as secretary and general manager in October, 1914, and devoted his time to travel.

His first wife died seven years ago. He married, in June, 1916, Miss Bertha Field, who survives him. The wedding trip was to Japan and other countries of the Orient. Returning to America last October, he resided in Brookline, Massachusetts.

A FORMER RUBBER STAMP MANUFACTURER.

James K. Stewart, for many years a prominent manufacturer of rubber stamps in Cincinnati, Ohio, died suddenly at his home in that city on January 26. He was an active and energetic member of the International Stamp Manufacturers' Association, and was a member of its board of directors. Through his efforts the Cincinnati Stamp Club was formed, and he was elected president, which position he resigned when he withdrew from the stamp business. He was engaged in the stationery trade at the time of his death.

FIRESTONE SALES MANAGER.

F. C. Blanchard, sales manager to motor car makers, of the Firestone Tire & Rubber Co., Akron, Ohio, died at the City Hospital there February 12, following an operation. Mr. Blanchard was born in Akron and his business career began with the Whitman & Barnes Manufacturing Co. at the age of 17. Developing rapidly, he became an efficient salesman and about six years ago joined the Firestone organization as assistant sales manager, to take special charge of the sales to manufacturers, and for one year, during the absence of R. J. Firestone, he acted as general sales manager.

Mr. Blanchard had a wide acquaintance among the automobile manufacturers throughout the country and was very popular, having hundreds of friends in the industry. He was a member of the Portage Country Club, the Akron City Club and the Rotary Club. He leaves a widow and two children.

JUDICIAL DECISIONS.

CATARACT RUBBER CO., EMERSON ET AL. V. CASTOR ET AL. In the matter of the bankruptcy of the Cataract Rubber Co., which maintains and operates a plant for the manufacture of rubber tires at Wooster, Ohio, Robert S. Emerson, as trustee in bankruptcy and receiver of the bankrupt and another, instituted proceedings for the recovery of property against which Charles A. Castor and others asserted liens and priorities, and appealed from a decree upholding the liens. The decree was reversed and remanded, with directions for modification. [The Federal Reporter, Vol. 236, page 31.]

SLAMA TIRE PROTECTOR CO. V. RITCHIE ET AL. The action by the company against J. A. Ritchie and another, partners as Ritchie & Heriot, was for breach of contract. The plaintiff's appeal from an adverse judgment was affirmed. [The Pacific Reporter, Vol. 161, page 25.]

THERMOID RUBBER CO. V. BRICHTSON. In an action of the Thermoid Rubber Company against O. A. Brichtson, trading under the name of the Brichtson Manufacturing Co., the plaintiff appealed from an order overruling the demurrer to the defendant's counter claim. The appeal was perfected July 7, 1916. No briefs had been filed in the Supreme Court of South Dakota, nor had any stipulation been filed, extending the time for such filing. The appeals were therefore deemed abandoned, and the order appealed from was affirmed. [The Northern Reporter, Vol. 159, page 872.]

UNITED STATES RUBBER CO. V. BERNARD SILVERSTEIN. The action was brought to recover a guaranty for the payment of goods sold to the defendant's sons which the court pronounced ambiguous, being based upon grammatical errors. The motion for a new trial was denied. [The New York Supplement, Vol. 161, No. 3, page 369.]

DAYLIGHT SAVING.

THE movement to turn all clocks in the country one hour ahead of the present standard time during the summer months has taken on great impetus as a result of the recent National Daylight Saving Convention in New York City and President Wilson's endorsement of the plan. The matter was also under consideration at the fifth annual meeting of the Chamber of Commerce of the United States at Washington, District of Columbia, a special committee having recommended congressional action to authorize the change throughout the year. While the directors agree that the plan should be adopted during the summer months, they are not prepared to advocate its adoption for the whole year, and the matter will probably be referred to the membership through a mail referendum.

American manufacturers of rubber as well as other goods are fully alive to the manifest physiological, economic and social advantages of the daylight saving plan, as demonstrated last summer in Germany, Austria, France, Italy, Portugal, Holland, Denmark, Norway and Sweden, where clocks were uniformly turned forward. Progressive men among them believe the project offers a measure of relief particularly desirable during the present feverish activity in most factories of the country. No argument is needed to the effect that a cool morning working hour, instead of a hot one in the afternoon, together with increased daylight during the hours of greatest fatigue, will increase opportunities for beneficial recreation with consequent greater personal efficiency, will reduce industrial accidents, lessen the tuberculosis tendency and reduce eye strain. The advantages of having the transportation "rush" hour occur before nightfall are apparent, and the total direct savings in fuel for artificial light would be tremendous.

Interesting Letters from Our Readers.

RUBBER RECLAIMING BECOMING A GREAT INDUSTRY.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—It does the heart of a practical rubber technologist to note that leading rubber manufacturers are at last manifesting active interest in the proposition to provide within our own borders the raw materials essential to the rubber

industry. Recently we have heard much about preparedness, and the international situation today emphasizes the reasons for it as never before. In our own line, substantial progress has been made in Imperial Valley, California, toward providing the long-staple cotton necessary for tire fabrics. It has been demonstrated that we can, if need be, maintain that industry without cotton imports. But America in the future must be prepared to produce its own rubber.

Heretofore commerce has followed the flag. In the case of rubber production the flag must follow the plow. Our land-grant colleges should offer special instruction in tropical agriculture and make rubber culture a requirement. The Americas have the soil as well as the conditions, and though handicapped by the cheap labor of the Orient, American methods, aided by American machinery, will be successful.

J. C. Harvey, that pioneer in rubber culture, who gathered from the many corners of the earth the various kinds of rubber-bearing plants and grew and studied them on his Mexican hacienda, had in his collection the *Hevea*. Specimens of this tree planted and grown under poor conditions had made, a few years ago, as good an appearance as many of the Malayan representatives did in their early life. Had these trees been given the benefit of cultivation and time, what might have been the result? Harvey's work, while left unfinished, was not lost. Who will take up the thread?

Another matter not entirely devoid of interest is the possibility, though remote, of the production of crude rubber in the Temperate Zone. The milkweed idea is not wholly deceased, and during 1917 a small-scale experiment to determine the exact economic value of the *Asclepias* in the production of rubber, fiber and oil (from seed) will be tried out in the fertile soil of the Big Miami Valley where the plant reaches its maximum growth. During the past season Willis Knickerbocker, New Lenox, Illinois, has experimented with the fruit of the Osage orange. He has tried waterproofing cloth with Osage "orangeade" and I have seen worse results. In Arizona the ocotillo (*Fouquieria splendens*) is being extracted for the wax, which is said to be a good substitute for chewing-gum. This plant under suitable treatment should yield another product valuable as a compounding ingredient.

A local rubber concern has acquired land in Salt River Valley, Arizona, and will grow its own supply of cotton there. In connection with this enterprise the conditions are ideal to test the Lloyd system of growing guayule. The rabbit-weed or pingue (*Picradenia floribunda*) would probably give even better results.

Writing about fibers for auto tires leads to the suggestion of the use of some of our uncommon native fibers. Many years ago, the East Indian *Abutilon* was introduced into the United States, and has now become a troublesome weed throughout the Central States. The plant produces a strong fiber. Our moraceous wild Indian hemp (*Cannabis sativa*) produces a good fiber as well as rubber. In the Pecos district of western Texas thousands of acres are overgrown with the Spanish bayonet. This plant has an excellent fiber in its leaf and a valuable glucoside in its root.

Altogether there are still several lines of considerable promise worthy of investigation and experiment at the hands of progressive, forehanded rubber manufacturers.

C. P. F.

Cleveland, Ohio, January 30, 1917.

GROWING RAW MATERIALS IN THE AMERICAS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—It does the heart of a practical rubber technologist good to note that leading rubber manufacturers are at last manifesting active interest in the proposition to provide within our own borders the raw materials essential to the rubber

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

PROGRESSIVE.

Housing the Connecticut Mills Employes

By John Barnard, Architect.

ANYBODY who has seen a typical cotton mill town with its unsightly rows of barn-like tenements will be pleasantly surprised by a visit to Danielson, Connecticut. Opposite the growing plant of the Connecticut Mills Co., weaver of tire fabrics, in a rolling tract of land 150 acres in extent and containing a picturesque little pond, is springing up a model village of comfortable, attractive cottages for the operatives. Winding streets are being laid out, landscape features determined, and when the development is complete, extensive lawns, shade trees, flower and vegetable gardens will complete the picture and combine all the benefits of country living with such conveniences of the city as electric lights and sanitary plumbing.

The housing movement was slow to reach cotton operatives because of the long established conviction that crowded tenements sufficed. But R. J. Caldwell, of New York City, thought differently, and the work now under way around the mills at Danielson, and at Sherbrooke, Quebec, as well as that contemplated at Taunton, Massachusetts, has acted as an incentive to others who are falling in line. Mr. Caldwell believed that because cotton operatives had always been obliged to hive together was no reason to suppose they did not long for modern conveniences. Moreover, the result of his experiment has proved that they do desire and appreciate better conditions, will not intentionally abuse them, are amenable to suggestions for a higher standard of living, and that greater efficiency and permanency of employment are the results.

Mill officials and citizens of Danielson financed the project by organizing the Danielson Construction Co. and subscribing a working capital of \$40,000. The houses are erected by local builders, rented by the mill for a period of three years at 10 per cent of their cost, and then sub-let to employes and the rental of about \$4 weekly deducted from the pay envelope of the tenant. Ordinarily this rental is easily within the reach of cotton mill operatives, who are now receiving the highest wages in the history of the industry. Moreover, there are often several wage earners in a family. In special instances, however,

when for some adequate reason the amount is more than a deserving employe can afford to pay, the mill will assume part of the annual rental up to \$25.

Many operatives wish to own their own homes, and to encourage this tendency toward permanence and better citizenship, N. D. Prince, vice-president of the Windham County National Bank, rose to the occasion and arranged not only to have his bank lend any reasonable sum to the construction company, but to assist individual financing as well. Thus the bank takes a 70 per cent first mortgage provided the operative can furnish the other 30 per cent himself. When a deserving person cannot do this, yet desires to buy a home, the mill advances it on a second mortgage, deducting the amount proportionately from the tenant's pay envelope until the second mortgage is disposed of, and continuing thereafter to make such equitable deductions as circumstances permit for the payment of the first mortgage.

Several four-family houses were put up at the outset as receiving stations for new help as recruited, but later operations have been principally in single houses with a few of the two-family semi-detached type, most of them intended for sale to operatives. Each single house is about 25 feet square with four rooms of ample size on each floor, a good porch, attic and cellar. A bathroom with open plumbing, hot and cold water in the kitchen

and bathroom, and electric lights throughout are the principal features, however. Floors and wood trim are of Georgian pine with inside walls of rough plaster oil-painted in warm tints, which is more sanitary than wall paper and more easily repaired.

William H. Cox, the architect, has provided several floor plans, to which various exteriors can be applied. Only four or five similar houses will be erected, and these are to be so scattered over the entire development and so varied by the use of shingles, clapboards, siding or stucco for the exterior walls, as to avoid any appearance of duplication. Thus far all have been of wood in the Colonial spirit, but several of the English cottage type are soon to be erected. The cost is about \$1,900 each, or \$3,600 for the two-family houses.

A PLEASING TWO-FAMILY HOUSE FOR THE CONNECTICUT MILLS CO.

PICTURESQUE TYPES OF SINGLE HOUSES AT DANIELSON, CONNECTICUT; A GAMBREL-ROOF LEAN-TO AND A CAPE COD FARMHOUSE.

News of the American Rubber Trade.

THE FISK RUBBER CO. CONFERENCE.

A FOUR-DAY conference of district and branch managers of The Fisk Rubber Co., Chicopee Falls, Massachusetts, held during the past month, was not only the first gathering of all the executive heads of this company, but also in the nature of a dedication of the enlarged model industrial plant which houses the manufacturing and administrative departments.

Vice-President E. H. Broadwell welcomed the delegates at the factory, and during the session addresses were made by the following department heads: F. H. Ayers, sales manager; J. D. Anderson, factory manager; E. M. Bogardus, comptroller; George L. Sullivan, advertising manager; Charles H. Gage, of the sales department; Leon H. Southmayd, in charge of the bicycle tires and tire sundries department; George B. Hendrick, publicity manager; W. B. Keiser, credit manager; R. B. McGaw, assistant treasurer; W. H. Bogardus,

per cent on common stock was declared payable March 31 to stockholders of record March 15.

NEW YORK RUBBER CO.

At a stockholders' meeting of the New York Rubber Co., New York City, held on January 30, the following trustees were elected for the ensuing year: John Acken, Rufus A. Brown, William H. L. Lee, E. S. Woodward, Henry Montgomery, H. F. Hering and George Langdon. At a meeting of the trustees on the same date, officers were reelected as follows: John Acken, president and treasurer; Henry Montgomery, vice-president and secretary; H. F. Hering, second vice-president.

H. MUEHLSTEIN & CO.'S NEW PLANT.

The general offices of H. Muehlstein & Co., scrap rubber merchants, have been removed from Washington and Hubert streets

H. MUEHLSTEIN & Co.'s Plant, New York City.

manager of the branch auditing department; C. I. Bradley, manager of the service department; William J. Lambe, Detroit district manager, and John B. Maus, export manager.

Meetings were held at the plant, but the visitors' headquarters were at the Hotel Kimball, Springfield, Massachusetts, where a banquet concluded the conference.

PENNSYLVANIA RUBBER CO. MEETING.

At the annual meeting of the stockholders of the Pennsylvania Rubber Co., Inc., held at Jeannette, Pennsylvania, Monday, February 19, the following directors and officers were elected for the ensuing year: Herbert DuPuy, chairman; H. Wilfred DuPuy, president-treasurer; Chas. M. DuPuy, vice-president; Seneca G. Lewis, general manager; Geo. W. Shiveley, secretary; Chas. G. Morrill, assistant treasurer.

The five first named and G. A. McLaughlin compose the directorate.

A quarterly dividend of $1\frac{3}{4}$ per cent on preferred and $1\frac{1}{2}$

to Third avenue, at One Hundred and Thirty-third street and the Harlem River, where they have a large and finely equipped establishment devoted exclusively to scrap rubber and rubber waste. The plant consists of three connecting buildings, each five stories and basement, with an aggregate floor space of 100,000 square feet, in addition to considerable yard space, and the property affords exceptional rail and water shipping facilities. Included in the special equipment provided for operating the plant are three large elevators, 10 Minnich steel presses and several 7-ton Hurlburt motor trucks.

BOSTON BANK ESTABLISHES ARGENTINE BRANCH.

The First National Bank of Boston will shortly open a branch at Buenos Aires, under the managership of Noel F. Tribe, a banker of experience who has resided in Argentina for over 20 years. This extension of the bank's activities will be appreciated by merchants and manufacturers interested in trade with this prosperous South American republic.

TRADE NOTES.

The Newport Chemical Works, Inc., New York City, now occupies new offices at 120 Broadway, suite 1005-1006.

At the annual meeting of the Chicago Rubber Clothing Co., Racine, Wis.-consin, the capital stock was increased from \$175,000 to \$350,000, and the following board of directors elected: Walter C. Palmer, George G. Bryant, A. E. Boyeson, James Murphy, E. L. Haynes, Martin Hueffner, Edward L. Baker. The board then organized by electing the following officers: Walter C. Palmer, president; James Murphy, vice-president; George G. Bryant, secretary and general manager; Martin M. Hueffner, treasurer.

Gutta Percha & Rubber, Limited, Toronto, Canada, has donated \$5,000 to endow a bed in the Toronto General Hospital for its former president, the late Captain Trumbell Warren, 15th Toronto Highland Battalion, who fell in action on April 20, 1915.

The Farrel Foundry & Machine Co. announces the removal of its Cleveland, Ohio, office on March 1 to 810 Union National Bank Building.

The City Council of Niagara Falls, New York, recently purchased 1,000 feet of fire hose from the Manhattan Rubber Manufacturing Co., of Passaic, New Jersey, and the Bi-Lateral Fire Hose Co., of Chicago, Illinois.

The recently organized India Rubber Co., located at Mogadore, Ohio, has purchased 13 acres of land near the railroad. The company is capitalized for \$125,000 and proposes to spend \$100,000 in the erection and equipment of the plant. The principal stockholders are J. M. Alderfer, R. M. Fillmore and J. K. Williams. The executive office will be in Akron, Ohio.

The Acorn Insulated Wire Co., Inc., Brooklyn, New York, has increased its capital stock from \$25,000 to \$60,000, in order to finance the installation of machinery in a new unit of its plant, and also to cover the cost of considerable raw material purchased to guard possible shortage caused by diplomatic complications.

The Standard Underground Cable Co., Perth Amboy, New Jersey, is building a 25 by 75 foot four-story and basement extension to one of the wings of its rubber factory.

The Flawless Rubber Co., of New Castle, Pennsylvania, a year-old corporation, said to be making goods of various descriptions, recently elected George H. Wind, president; John Burns, vice-president; Paul Hartmann, treasurer, and Joseph Ganster, secretary.

The Bunker Hill Rubber Works, Bunker Hill, Illinois, has opened its factory and commenced the manufacture of mechanical rubber goods.

Thomas A. Murray, formerly police commissioner of New Haven, Connecticut, and later connected with the Seamless Rubber Co., of that city, has been elected president and general manager of the National Rubber Co., Pottstown, Ohio.

The Federal Rubber Manufacturing Co., Cudahy, Wisconsin, has recently completed a \$200,000 addition to its power plant.

The Kokomo Rubber Co., Kokomo, Indiana, capitalized for \$200,000, is reported sold to a holding company for \$1,200,000.

The Oldtown Rubber Co., Xenia, Ohio, has been purchased by Robert Kuhn, of Cincinnati, Ohio. A radical change of policy is planned under the new management.

The Mineralized Rubber Co., with headquarters at Newark, New Jersey, is reported to be in the hands of a receiver. The business of the company was the manufacture of a rubber composition cap for automobile radiators. One of the petitioning creditors is Harold C. Dodge, of East Orange, New Jersey, president of the company, whose claim is for \$7,000, money advanced.

The stockholders of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, at a special meeting held recently, unanimously approved an increase in the capital stock from \$60,000,000 to \$75,000,000. The additional stock will be common and will consist of 300 shares of a par value of \$50.

RUBBER FIRMS PLEDGE GOVERNMENT SUPPORT.

RUBBER plays an important part in the national defense, and in connection with the present program of accelerated preparedness it is a sincere pleasure to record the promptness with which leading American rubber manufacturers joined other industrial and commercial establishments in pledging their hearty support to the Federal Government in any emergency that may arise. On February 3, Samuel P. Colt, president, placed the 47 factories, organization, manufacturing resources and distributing facilities of the United States Rubber Co. at the disposal of the government in case of need. The resources of this, the greatest rubber manufacturing firm in the world, are tremendous, its large plantations in Sumatra being an important national asset.

Other great rubber firms to offer their factories include The B. F. Goodrich Co., Akron, Ohio; Firestone Tire & Rubber Co., Akron, Ohio; United & Globe Rubber Manufacturing Cos., Trenton, New Jersey. More names will doubtless have been added to the list before this reaches our readers.

WESTINGHOUSE BUILDS NEW PLANT.

The site for the new plant of the Westinghouse Electric & Manufacturing Co., at Essington, near Philadelphia, Pennsylvania, embraces about 500 acres, with a frontage of approximately one mile on the Delaware River, additional transportation facilities being afforded by tracks from the Pennsylvania and Philadelphia & Reading railroads.

This new center will be devoted to the production of large apparatus, the first group of buildings being for power machinery, principally steam turbines, condensers and reduction gears. The initial development will cost in the neighborhood of \$5,000,000 or \$6,000,000, occupying about one-fifth of the area of the entire plot, the buildings consisting of two large machine shops, an erecting shop for heavy machinery, forge shop, pattern and pattern storage shop and power house.

The employees to be engaged at the new plant will number several thousand, and undoubtedly will in the future equal the number employed at the East Pittsburgh, Pennsylvania, plant of the company, representing over 20,000 people.

MAKING RUBBERS ON BROADWAY.

The public likes to know how commonly used articles are made, and recent instances indicate that there is no better window advertising than a manufacturing demonstration such as that conducted by the United States Rubber Co., 1790 Broadway, New York City. During the week of January 22 one of the handsomely decorated display windows was fitted up like the making room of a well-equipped rubber footwear factory and four operatives from the Goodyear's Metallic Rubber Shoe Co. manufactured women's croquets and storm slippers, also United States patent pressure process rubber boots in black, red and white. Large crowds showed great interest in the diaphragm machine employed to press the parts of women's rubbers into practically one piece.

NEW METHOD OF SOLING BOOTS.

The American Consul at Leeds, England, reports a patented method of manufacturing boot soles from scrap leather. It is claimed that the soles are non-suction, non-slipping, and water proof; that they can be produced at much lower cost than the ordinary leather sole. Owners of plants for heelbuilding, it is believed, will find themselves in a position to adopt the new process conveniently.

It is also claimed that the novelty of the patent may be enhanced by an ingenious arrangement of strips of rubber attached to a thin layer of canvas, the rubber strips fitting into the interstices of the leather sections. This is said to give a pleasing resiliency to the step of the wearer.

UNITED STATES RUBBER CO. CONSOLIDATES SUBSIDIARIES.

At a special meeting of the stockholders of the United States Rubber Co., held at New Brunswick, New Jersey, on February 14, it was voted unanimously to authorize the carrying out of the plans proposed. The vote was the largest ever held at a stockholders' meeting. Proxies of 83 per cent of every class of stock outstanding were represented.

One proposal was to acquire the real estate, plants and equipment of the companies of which this company owns, or shall own, substantially all of the common capital stock. The effect of this vote is that the following plants will become part of the parent company: Revere Rubber Co., Rubber Regenerating Co., the Naugatuck Chemical Co., the Eureka Fire Hose Manufacturing Co., American Rubber Co., the Joseph Banigan Rubber Co., Boston Rubber Shoe Co., L. Candee & Co., Goodyear's India Rubber Glove Manufacturing Co., The Goodyear's Metallic Rubber Shoe Co., Hastings Wool Boot Co., National India Rubber Co., Shoe Hardware Co. and Woonsocket Rubber Co.

A similar action by the General Rubber Co. stockholders added the following: Morgan and Wright, Hartford Rubber Works Co., G. & J. Tire Co., Mechanical Rubber Co., Mechanical Fabric Co., New York Belting & Packing Co., Stoughton Rubber Co., Peerless Rubber Manufacturing Co., Fabric Fire Hose Manufacturing Co., Midgeley Manufacturing Co., Sawyer Belting Co. and India Rubber Co.

It was also unanimously voted to confirm the directors' plan for a bond issue, all of which is included in the comprehensive plan by the Secretary of State of Connecticut, where this asso-

THE RUBBER ASSOCIATION OF AMERICA, INC., AUTHORIZED.

The change of name of The Rubber Club of America, Inc., to The Rubber Association of America, Inc., has now been authorized by the Secretary of State of Connecticut where this association is incorporated.

Members of the Association have been notified that shipments of rubber goods may now be made direct to the Portuguese islands of the Atlantic, namely the Azores, Cape Verde and Madeira islands. In this connection the British Consul General at New York states that the British War Trade Department feels considerable apprehension lest the ports of Portugal may come to be used for landing goods destined for Spain or elsewhere. Members are urged to send no rubber goods to any Portuguese ports not intended exclusively for consumption in that country.

Secretary Vorhis has sent the members a circular stating that the embargo conditions are not relaxed in any way, with the above exception, and advises that rubber manufacturers again notify their export managers of the terms of their bonds and guarantees so that all engaged in the export trade will be fully informed regarding the situation, and cannot plead ignorance, in the event of violations.

RUBBER COMPANY DIVIDENDS.

The New York Rubber Co. paid a regular dividend of 8 per cent and an extra dividend of 2 per cent on February 1.

The Hood Rubber Co. paid a regular quarterly dividend of 1½ per cent on preferred stock on February 1 to stockholders of record January 27.

The board of directors of The B. F. Goodrich Co. has declared a dividend of 3½ per cent on preferred stock, payable 1½ per cent on April 2 to stockholders of record March 23, and 1½ per cent on July 2 to stockholders of record June 22; also a quarterly dividend of 1 per cent on common stock, payable May 15 to stockholders of record May 4.

EDW. A. BARRIER.

BORN and brought up in Cambridge, Massachusetts, Edw. A. Barrier received his education in the Cambridge schools and was graduated from Massachusetts Institute of Technology in 1905. The rubber industry having appealed to him, he was employed for a time by the Boston Woven Hose & Rubber Co.,

Cambridge, Massachusetts, in a number of different departments with the idea of learning the business. He soon went into teaching, however, first as assistant instructor in analytical chemistry at the Massachusetts Institute of Technology and later as instructor in analytical and metallurgical chemistry in the University of Cincinnati, Ohio.

In 1907 Mr. Barrier became connected with the Inspection Department of the Associated Fac-

E. A. BARRIER.

tory Mutual Fire Insurance Cos. as chemical engineer, and established and organized a chemical laboratory for the examination and testing of rubber and other products. This was one of the first laboratories established in the country which seriously took up the chemical examination of rubber from the consumers' standpoint. As chairman of the Rubber Products Committee, the Sub-Committee on Cold Water Hose and a member of the Pump Valve Committee of the American Society for Testing Materials, Mr. Barrier has played a considerable part in the development of specifications for rubber products, having conducted investigations along these lines, some of the results of which have been published in various periodicals.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on February 24 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle Street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	69	72
Firestone Tire & Rubber Co., common.....	144½	147½
Firestone Tire & Rubber Co., preferred.....	107	109
The B. F. Goodrich Co., common.....	55½	56½
The B. F. Goodrich Co., preferred.....	108	110
Goodyear Tire & Rubber Co., common.....	271½	275½
Goodyear Tire & Rubber Co., preferred.....	106½	108½
Kelly-Springfield Tire Co., common.....	53	54
Kelly-Springfield Tire Co., preferred.....	90	93
Miller Rubber Co., common.....	253	257
Miller Rubber Co., preferred.....	105	106¾
Portage Rubber Co.....	164	168½
Swinehart Tire & Rubber Co.....	79½	85½
United States Rubber Co., common.....	53½	54½
United States Rubber Co., preferred.....	105	109

CINCINNATI RUBBER MANUFACTURING CO. MEETING.

At the annual meeting of the stockholders of The Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio., on February 13, the following directors were elected: S. D. Baldwin, F. A. Geier, Jas. A. Green, S. E. Hilles, Geo. McG. Morris, Casper H. Rowe, Stanley M. Rowe, F. D. Scherl; and on reorganization of the board, the following officers were elected for the ensuing year: S. D. Baldwin, president; F. D. Scherl, vice-president and treasurer; S. M. Rowe, secretary. The company has had a prosperous year and the outlook for business the present year is favorable.

PERSONAL MENTION.

Fred H. Ferguson, for over 20 years a salesman of the Boston Belting Co., in Buffalo, New York, and vicinity, has taken the agency for the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, covering the same territory.

J. A. Kurvy, formerly with Taylor, Armitage & Co., New York City, is now associated with Forney & Co., 350 Broadway, New York City, dealer in sheetings, drills, osnaburgs and special fabrics used by the rubber trade.

Edwin Curbishley, manager of the Xylos Rubber Co., Limited, Manchester, England, manufacturer of reclaimed rubber, recently called on the American rubber trade.

P. J. Ramler, recently connected with the sales department of the Racine Rubber Co., has been appointed manager of sales for the Vulcanized Products Co., Muskegon, Michigan.

E. B. Merriam, for several years assistant engineer of the switchboard department of the General Electric Co., Schenectady, New York, has resigned that position to assume the management of the industrial service department recently organized to supervise education, employment, and provision of opportunities for advancement of employees at the Schenectady plant of the company. He brings to his new position a broad and sympathetic understanding of the requirements of the situation.

F. Richard Carroll is the new district manager for The B. F. Goodrich Co., at San Francisco, California, succeeding C. E. Cook. Mr. Carroll has been manager of the Los Angeles, California, branch for the past six years, and on the eve of his departure from that city, was given a surprise dinner by the Goodrich organization in the South, at which a handsome gold watch and chain were presented to him.

George B. Hodgman, president of the Hodgman Rubber Co., Tuckahoe, New York, and Mrs. Hodgman celebrated the twenty-fifth anniversary of their marriage by entertaining a large number of their friends at a dinner and dance in the ball room of the Ritz Carlton Hotel, New York City, February 23.

FROM THE FAR EAST.

Dr. J. G. C. Vriens, of Medan, Deli, east coast of Sumatra, for the last three years technical adviser of the "Association des Planteurs de Caoutchouc de la Belgique," and for the ten previous years director of the experimental station for tea and tobacco cultivation in Sumatra, was in New York last month, on an enforced supplementary visit. He left Medan some months ago to visit his native city, Rotterdam, visiting Japan, Hawaii and many points of interest in the United States en route, and embarked on the "Ryndam" for Rotterdam, which steamer, when nearly in sight of Europe, was ordered by wireless to put about and return to New York. Doctor Vriens predicts a great future for the rubber plantation industry in Sumatra, with a steady increase in direct shipments from there to this country.

J. C. MATLACK RETIRES FROM AJAX CO.

J. C. Matlack, secretary and general manager of the Ajax Rubber Co., Inc., New York City, tendered his resignation at the annual meeting of the company, February 13. It is his intention to take a long rest at his home at Great Neck, Long Island.

Starting in business with the Simmons Hardware Co., in St. Louis, Missouri, he rose to the management of the bicycle and accessory department of that house and then went to A. Fetherstone Co., of Chicago, Illinois, as eastern sales manager. When the American Bicycle Co. was organized he became purchasing agent for the more than 60 factories. In 1901 he was made western sales manager, which position he resigned in 1902 to become president of the International Automobile & Vehicle Tire Co., Milltown, New Jersey. In 1907, when this company was suc-

ceeded by the Michelin Tire Co., he was made vice-president and general manager. In 1911 he left the Michelin company to connect himself with the newly organized Ajax Rubber Co., as secretary and general manager, and the success of that company under his able management is too well known to need further mention.

Mr. Matlack is too active and vigorous to retire and it is quite unlikely that he will content himself to remain out of business for any great length of time. He is succeeded in the Ajax company by Fred E. Dayton, who acts as general sales manager.

RICHARD A. LEIGH.

RICHARD A. LEIGH, general manager of the Dry Climate Tire Manufacturing Co., Arvada, Colorado, began his business career as an apprentice with the

R. A. LEIGH.

Revere Rubber Co., Chelsea, Massachusetts, in 1888, under the direction of his father, who was then factory superintendent. Later he became associated with the Boston Car Spring Co., Boston, Massachusetts, and from there went to the Reading Rubber Tire Co., which later merged into the Consolidated Rubber Works, taking over the plant of the Chelsea Fabric Co., Chelsea, Massachusetts. The firm was afterwards absorbed by the United States Rubber Co. and the plant and machinery transferred to the National Rubber Co., Bristol, Rhode Island, with which Mr. Leigh was connected for five years. He then became tire expert for the Mechanical Rubber Co., Cleveland, Ohio, from which position he went to take up his present work. The Dry Climate Tire Manufacturing Co. is to be congratulated upon having as general manager a man of such long and varied practical experience in the manufacture and selling of rubber goods.

BATAVIA RUBBER CO. ABSORBS SIMPLEX RUBBER CO.

At a special meeting of the stockholders of the Batavia Rubber Co., held at the main offices of the company at Batavia, New York, February 23, the capital stock of the company was increased from \$500,000 to \$675,000 to provide for the purchase of the plant and other assets of the Simplex Rubber Co. of America, Ossining, New York. The Batavia company manufactures pneumatic automobile tires and the Simplex company solid rubber truck tires.

The merger of the two companies has also been authorized by the Simplex stockholders and the plant and organization will probably be moved to Batavia as soon as arrangements can be completed, and will occupy a site recently purchased by the Batavia company, adjoining its present factory. The consolidated company will be known as the Batavia Rubber Co. and will manufacture pneumatic automobile tires, solid rubber truck tires and a line of mechanical goods.

NEW INCORPORATIONS.

Amazon Rubber Co., The, February 6 (Ohio), \$500,000. L. J. Schott, Louis F. Smith, C. Bettler, J. Henry Adams, and Frank B. Burch. Principal office, Akron, Ohio. For the purpose of taking over the entire assets of The Amazon Tire & Rubber Company and operating the present plant on a much larger scale.

American Garter Co., February 9 (Delaware), \$125,000. Sidney C. Wallace, L. L. Cowan and R. Montgomery—all of Chicago, Illinois. To manufacture and deal in garters, hose supporters, etc.

Bulley Rubber Machinery Co., February 9 (Delaware), \$100,000. Herbert E. Latter, and Norman P. Coffin, Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. To manufacture all kinds of machinery and appliances adaptable to the milling, mixing and compounding of rubber and rubber cements.

Central Vulcanizing Works Inc., February 17 (New York), \$10,000. Jacob Brown and Tillie Brown, Albany, New York, and B. F. Barford, Valatie, New York. Tire repair and sales business.

Clouse Tire & Repair Co., The, December 11 (Ohio), \$25,000. J. E. Phillips, 6513 Euclid avenue; A. W. Gillespie, 1779 East Sixty-fifth street; M. Clouse, 2114 East Eighty-third street—all in Cleveland, Ohio. Principal office, 6513-6515 Euclid avenue, Cleveland, Ohio. To take over the Clouse Tire Repair School Co.

Double Fabric Tire Co., January 10 (Indiana), \$900,000. W. H. Willennar, A. L. Murray, Simon J. Straus and Isaac D. Straus. Principal office, Auburn, Indiana. To manufacture and sell tires, tubes, and tire accessories.

Endurance Tire & Rubber Corporation of New York, January 27 (New York), \$1,000,000. Harry G. Smith, Benjamin F. Norris, and Frank B. York—all of 271 Broadway, New York City.

Finebergs' Auto Tire & Accessory Co., January 29 (New Jersey), \$100,000. Isaac Fineberg, Herman Fineberg, Samuel Fineberg—all of Trenton, New Jersey. Principal office, 10-12 East Hanover street, Trenton, New Jersey. To deal in tires, etc.

Grayson, S. J., Inc., February 16 (New York), \$2,000. S. J. Grayson, Hohokus, New Jersey; Charles Netter and Robert Netter, 220 Broadway, New York City. Tires and rubber goods.

Hoosier Tire Co., September 26, 1916 (Indiana), \$10,000. Eugene M. Fife, W. R. Fife, and E. H. Fife—all of Indianapolis, Indiana. Principal office, Indianapolis, Indiana. To deal in tires.

Jones Rubber Heel Co., Inc., February 5 (New York), \$25,000. A. H. Serrell, Woolworth Building; James J. Jones, 13 Park Row, and Edward O. Towne, 214 West Ninety-second street—all in New York City.

Kirkham, I. C., Sales Co., Inc., January 24 (New York), \$12,000. Isaac C. Kirkham, 1365 Bedford avenue; E. A. Carleton, 959 Bedford avenue, and M. L. Kirkham, 1246 Pacific avenue—all in Brooklyn, New York. To deal in auto tires, etc.

Kokomo Rubber Tire Co., Inc., January 27 (New York), \$5,000. William Adelson and Edward J. Carter, 15 Broad street, and Thomas H. Keogh, 52 Broadway—both in New York City. To manufacture tires, etc.

Lambert Tire Co., January 3 (Washington), \$5,000. H. S. Chapman, M. F. Landrith, L. W. Lemon.

Laravie, O. J., & Co., Inc., January 29 (New York), \$2,000. Oscar J. Laravie and Emogene S. Simons, Albany, and Clarence T. Dolson, Watervliet—both in New York. To deal in auto tires, accessories, etc. Principal office, Albany, New York.

Liberty Tire & Rubber Co., Inc., January 29 (New York),

\$10,000. Joseph Prince, 119 East One-hundred and First street; Robert C. Schlesinger, 638 West One-hundred and Sixtieth street, and Leon Kronfeld, 400 Riverside Drive—all in New York City.

Marathon Tire Sales Co., January 10 (Indiana), \$25,000. R. P. Oblinger (president), H. E. Rasmussen (treasurer), M. M. Fancher (vice-president), and J. D. Meek (secretary)—all of Indianapolis, Indiana. Principal office, Indianapolis, Indiana. To manufacture and sell tires and rubber goods.

Morrow Insulating Co., Inc., February 1 (New York), \$25,000. John J. Morrow and Clara Morrow, 674 Academy street, New York City, and H. M. Lewis, 2055 Washington avenue, Bronx, New York. To manufacture insulating material, etc.

National Tire Protector Co., February 8 (Delaware), \$50,000. J. Daniel Melchior, Max F. Henkelman and F. J. Helnegel, all of Scranton, Pennsylvania. To manufacture and deal in all articles for the protection of automobile and motor vehicle tires.

Nuremburg Manufacturing Co., Inc., January 26 (New York), \$600. Robert B. Gunshor, Paul Hoffman and David Dricker—all of 55 Liberty street, New York City. To manufacture artificial trees, toys, etc., of rubber, paper composition and other materials.

Oakland Tire Co., Inc., February 13 (New York), \$50,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both of Brooklyn, N. Y. To manufacture all kinds of tires, etc.

Resilia Co., The, January 17 (Massachusetts), \$200,000. Frank D. Wilde, 225 Hunnewell terrace, Newton; Oliver E. Chapman, Sharon, and Marion E. Zink, 526 Washington avenue, Revere—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in certain patented articles to be used in connection with other articles or goods to furnish resiliency and elasticity.

Rochester Tire Works, Inc., January 24 (New York), \$5,000. G. C. Kingdon, Grace Horth and F. A. Scholls—all of Rochester, New York. Principal office, Rochester, New York. To deal in auto tires, etc.

Steiner, O. A., Tire Co., January 3 (Oklahoma), \$10,000. J. C. Treat (president), S. W. Steiner (vice-president), O. A. Steiner (secretary-treasurer), and E. L. Russell—all of Tulsa, Oklahoma. Principal office, Tulsa, Oklahoma. Automobile tires and accessories.

Sterling Tire Corporation, February 1 (Delaware), \$2,500,000. Joseph A. Miller, 227 Fairview avenue, Rutherford; Otto Basten, East Rutherford, and Bartlett Greene, Passaic—all in New Jersey. Principal office, 486 du Pont Building, Wilmington, Delaware. To manufacture and deal in rubber tires for vehicles of all kinds.

Vulcum Tire Filler Co., August 17, 1916 (Indiana), \$10,000. Franklin A. Colver, Joseph J. Greenen and Oliver J. Boulden. Principal office, Indianapolis, Indiana. To manufacture tire fillers and mechanical devices for the filling of tires.

Woodworth Manufacturing Corporation, January 3 (New York), \$125,000. Charles B. Woodworth and Desmond Woodworth, Niagara Falls; Elmer H. Paterson, Howard G. E. Smith, Buffalo, and Robert H. Mahaney, Lockport—all in New York. Principal office, Whirlpool street, Niagara Falls, New York. To manufacture and deal in automobile accessories of all kinds and description.

PROMOTING RUSSIAN TRADE.

Exporters of rubber goods desirous to increase their business with Russia, the largest and most favorable of our distant foreign markets, and one that is daily growing with a rising civilization and quickening development, can obtain valuable information in pamphlet form, also specific advice and assistance, upon application to the American-Russian Chamber of Commerce, New York City, the mission of which is to promote American-Russian trade relationships.

AJAX AND RACINE RUBBER COMPANIES.

At the annual meeting of the Ajax Rubber Co., Inc., New York City, held February 13, the following officers were elected:

Horace De Lisser, chairman of board, New York City; William G. Grieb, president, Scarsdale, New York; L. P. Destribats, vice-president, Trenton, New Jersey (in charge of Trenton plant). H. L. McClaren, vice-president, Racine, Wisconsin; Louis T. Vance, vice-president, Racine, Wisconsin (in charge of Racine plant). Harold W. Stimpson, treasurer, New York City; William J. Jackson, secretary, Brooklyn, New York.

These, together with the following, comprise the directorate: Herbert H. Maass, New York City; Robert A. Patteson, Tarrytown, New York; L. B. Patterson, Chicago, Illinois; Joseph Weissenbach, Chicago, Illinois; Hugh K. Prichitt, New York City; Fred E. Dayton, New York City; H. C. Severance, Racine, Wisconsin; Stuart Webster, Racine, Wisconsin.

The combined statement of the Ajax Rubber Co. and the Racine Rubber Co. for the period ending December 31, 1916, shows sales to the amount of \$10,335,177.70. The balance sheet may be summarized as follows:

Gross credits	\$12,684,463.26
Total debits	9,856,447.25
Gross profit from trading	\$ 2,828,016.01
Total expense	1,559,704.80
Net profit from trading	\$ 1,268,311.21
Assets	\$ 8,629,061.21
Liabilities, including capital stock, accounts payable, reserves and stock of Racine Rubber Co. in process of redemption	\$ 8,473,885.42
Surplus and undivided profits	155,175.79
	\$8,629,061.21

The Ajax company took over the Racine company last December, hence this combined statement.

At the annual meeting of stockholders of the Racine Rubber Co. held at Racine, Wisconsin, January 30, 1917, the following directors were elected for the ensuing year: W. G. Grieb, H. L. McClaren, L. T. Vance, Stuart Webster, H. C. Severance, Horace DeLisser, Louis P. Destribats. The directors then elected the following officers: H. L. McClaren, president and general manager; L. T. Vance, vice-president and general factory manager; Stuart Webster, treasurer; H. C. Severance, secretary and general sales manager.

MOTOR AND ACCESSORY MANUFACTURERS COMMITTEES.

At a meeting of the Motor and Accessory Manufacturers, held early in February, it was decided to admit to membership makers of airplane motors, parts and accessories. A decision was reached to considerably expand the credit department. Among the subjects discussed were the Administration's \$248,000,000 Revenue Bill and the pending Morrison Bill regarding registration of designs.

President C. W. Stiger of the Motor and Accessory Manufacturers' Association, has just announced the various committees to serve for the ensuing year. As has been the custom of The M. & A. M. for years past, President Stiger will also act as chairman of the Executive Committee. With him are: C. E. Thompson, E. H. Broadwell, James H. Foster, W. O. Rutherford, Christian Girl and Alfred P. Sloan, Jr.

First Vice-President C. E. Thompson has been appointed chairman of the Finance Committee, which is composed of the same men who constitute the Executive Committee.

The Show and Allotment Committee: Christian Girl, chairman; C. E. Thompson, E. H. Broadwell, J. H. Foster and William C. Rands.

William M. Sweet, former manager of The M. & A. M., who has for several years so successfully conducted the annual ban-

quet of The Motor and Accessory Manufacturers, has been appointed chairman of the Banquet Committee. The other members are: E. H. Broadwell, T. J. Wetzel, James H. Foster and Christian Girl.

Membership Committee: E. W. Beach, E. H. Broadwell and T. J. Wetzel. Auditing Committee: C. W. Stiger, president; Alfred P. Sloan, Jr., secretary, and L. M. Wainwright, treasurer. Aeronautic Committee: President Stiger, Vice-President Thompson and William M. Sweet.

THE KELLY-SPRINGFIELD TIRE CO. REPORT.

The net sales of the Kelly-Springfield Tire Co., New York City, for the year 1916 were \$10,883,182.76. This company did no war business during the year. It was this greatly increased demand for its products that caused the directors to determine to build the new and much larger factory at Cumberland, Maryland, previously announced in these pages.

STATEMENT OF INCOME AND PROFIT AND LOSS.

Gross profit	\$3,464,458.77
Less: Operating expenses, including selling, administrative and general expenses	1,404,388.26
Net operating income	\$2,060,070.51
Other income, net: Cash discounts, interest and miscellaneous	57,243.33
Net income for the year	\$2,117,313.84

	\$13,162,552.47

NEW LOS ANGELES BRANCH FOR FIRESTONE.

The Firestone Tire & Rubber Co., Akron, Ohio, recently established a tire distributing building at Los Angeles, California, said to be the finest and largest branch service building in that section. It is a three-story, reinforced concrete and stucco structure, decorated with ornamental tile and of Oriental style of architecture. An elaborate celebration marked the opening of the new branch, in which 500 Firestone dealers from Southern California, Arizona and Nevada, and municipal officials and prominent citizens took part. The Firestone officials who spoke were R. J. Firestone, vice-president; S. G. Carkhuff, secretary; E. W. BeSaw, western district manager, and A. T. Smith, branch manager.

FISK RUBBER COMPANY INSTALLS WRAPPING MACHINES.

In October, 1915, the Fisk Rubber Co., Chicopee Falls, Massachusetts, installed a machine for wrapping tires with burlap or paper, prior to shipment. This was the first machine of its kind ever built.

After having operated this machine successfully for more than a year, requirements demanded a second machine, which was duly installed.

This type of machine, which has a capacity of fifty bundles an hour, is not only being used in this country, but in Europe as well, where its efficiency is recognized on account of the scarcity of labor.

TRADE NOTES.

The Federal Rubber Co., Cudahy, Wisconsin, recently purchased a 4,000-horse-power turbine from the Allis-Chalmers Manufacturing Co., which will furnish power for the new mills and calenders to be located in the addition to the company's plant now in process of erection.

The Tubeless Tire & Rubber Co., Millersburg, Ohio, maker of tubeless and pneumatic automobile tires, has increased its capital stock from \$75,000 to \$1,000,000 for the purpose of selling its own products.

The Firestone Tire & Rubber Co., Akron, Ohio, announces through its Michigan manager, H. A. Coffin, that a building costing in the neighborhood of \$500,000 is to be erected on the company's leased site at the northeast corner of Woodward and Canfield avenues in Detroit, just opposite the present location. A portion of the new building will be sub-leased, but under conditions that will make it possible for the Firestone company to expand its facilities whenever necessary.

The Mohawk Rubber Co. of New York, Inc., has opened a branch at 86 Brookline avenue, Boston, Massachusetts, where a complete stock of tires made in its Akron, Ohio, factory will be kept on hand. Norman W. Biggart, of New York City, will be manager.

The Ten Broeck Tyre Co., Louisville, Kentucky, will manufacture the cotton fabrics needed in its production of rubber tires for automobiles and other vehicles and is now arranging to install an equipment for spinning and weaving. The new machinery will be used for making the fabric for the Atlasta puncture and blow-out proof tube, for which the company has contracted with the Servis Tire & Tube Co. to manufacture for a period of five years.

The Bowling Green Rubber Co. has removed its plant from Bowling Green, Ohio, to Toledo, Ohio, gaining thereby better shipping facilities and larger manufacturing space.

The Midland Tire & Rubber Co., Coshocton, Ohio, has increased its capital stock from \$10,000 to \$500,000.

At a recent stockholders' meeting of the Norwalk Tire & Rubber Co., Norwalk, Connecticut, \$500,000 additional preferred capital stock was authorized, \$250,000 worth to be issued at once, this action rendered necessary to care for the increased volume of business and additional manufacturing space and equipment.

The California Tire & Rubber Co., tire distributor, San Francisco, California, is capitalized for \$25,000, and operates an effective vulcanizing department in connection with its business. The principal officers of the company are Captain William H. Homer, president, and George C. Homer, vice-president and secretary. Wesley D. Smith is sales manager.

The Toliver Punctureproof Tube Co., Denver, Colorado, has moved into new quarters which have a capacity of 500 tubes per day. Joseph Stein is vice-president and general manager.

The H. H. H. Tire & Manufacturing Co., jobber of automobile supplies and accessories, Newark, New Jersey, takes possession on March 1 of an entire building at 21 Baldwin

street, which will serve as a general office and warehouse, the present store at 263 Halsey street being retained as a salesroom. This company has recently issued \$25,000 worth of preferred stock in order to obtain additional working capital to care for its greatly increased business.

At the recently held first annual meeting of the Hawkeye Tire Co., Des Moines, Iowa, it was voted to change the name to the Hawkeye Tire & Rubber Co. John Christie, president; John Fredericks, vice-president, and C. B. Hextell, secretary-treasurer, were all reelected.

The newly organized Red Cross Rubber Co., Norwalk, Ohio, expects to commence operations in the early Spring. C. V. Martin is manager of the company.

The National Tire & Rubber Co., East Palestine, Ohio, has recently been acquired by a syndicate of local capitalists. New plans deal with a material increase in the scope and province of the concern.

The plant of the Toledo-Findlay Tire & Rubber Co., Findlay, Ohio, was offered for sale February 13 but was not sold owing to the extreme cold weather and delayed railroad traffic. The next date of sale has not yet been decided upon.

The Amazon Tire & Rubber Co., Akron, has appointed Tritt & Gockley, Canton, Ohio, distributors for Stark and Tuscarawas counties, with exclusive selling rights.

The Ehman Tire & Rubber Co., succeeding the Vail Rubber Co., Chicago, Illinois, has become, under the direction of A. C. Ehman, its president, one of the important rubber manufacturing concerns of the West. The present output is 300 tires daily and an extensive line of mechanical goods and molded specialties. The additions now under construction will materially increase the capacity of the plant and there is every indication of a greatly augmented volume for 1917.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has the contract to supply its Vacuum Cup tires for the 30 new motor vehicles of the Frank Parmelee Transfer Co., the principal transportation company of Chicago, Illinois.

The Centaur Tire & Rubber Co., Gallipolis, Ohio, is reported bankrupt. Pittsburgh capital was principally interested.

FIRESTONE APPOINTMENTS.

D. F. White, since 1910 head of the salesmen's department of the Firestone Tire & Rubber Co., Akron, Ohio, has been appointed Southern district manager.

W. S. Dellett has been given the managership of the Houston, Texas, branch.

R. L. Benham is now manager of the company's branch at San Antonio, Texas.

H. A. Lane, former salesman for the Firestone Tire & Rubber Co., is now manager of the Brooklyn, New York, branch.

NEW APPOINTMENTS OF THE GOODYEAR TIRE & RUBBER CO.

C. W. Martin, Jr., for five years manager of the motor truck tire department, has been placed in charge of the Southern district, with headquarters at Atlanta, Georgia.

R. S. Wilson, formerly in charge of the service department, is now manager of the motor truck tire department, G. E. Brunner, his assistant, being advanced to the position of manager of the service department.

W. R. Bliss, formerly manager of the Boston, Massachusetts, branch, has been made manager of the New York district, the assistant managership being given to D. M. Colwell, formerly manager of the Southern district.

B. S. Waterman, assistant manager of the New England district, assumes management of the Boston branch, continuing to care for the company's manufacturers' business in the New England district.

TIRE PRICE ADVANCES JUSTIFIED.

OFFICIAL figures seem to show that rubber manufacturers were fully justified in raising prices for their products, as many of them did the first of the year. A comparative table of the figures of three leading companies that have recently completed their fiscal years has been compiled by a leading financial journal which shows the gross, net, and ratio of manufacturing expense to gross, as follows:

	Goodyear.	U. S. Rubber.	Goodrich.
1916 gross	\$63,752,000	\$7,000,000	\$73,000,000
1915 gross	56,400,000	6,861,000	55,416,000
1916 net	7,003,000	12,500,000	9,550,000
1915 net	2,177,000	11,850,000	1,265,000
1916 manufacturing ratio	89.9 per cent	90.6 per cent	86.9 per cent
1915 manufacturing ratio	88.9 per cent	87.8 per cent	77.8 per cent

Estimated

It will thus be seen that The B. F. Goodrich Co. to gain \$17,000,000 gross income over 1915 figures, had to spend \$20,000,000 more than in 1915. The United States Rubber Co.'s increase in gross income was \$32,000,000, but its profits were only about \$1,000,000 more than the previous year. The Goodyear Tire & Rubber Co.'s gross increase was 13 times as large as its net increase. Such figures are the best evidence that last year's selling prices were too low for safe business.

TIRE FABRICS BOOMING NEW BEDFORD

The unprecedented demand for tire fabrics has resulted in a great boom for New Bedford, Massachusetts, and the cotton yarn trade generally. It is estimated that fully one-third of the yarn spindles in that city are now running on tire fabric yarns and the consumption of long-staple cotton is tremendous.

New Bedford to-day is to the American cotton industry what Liverpool is to the British industry. It has become the largest spot cotton center in the East. Southern shippers are sending thousands of unsold bales there in order to make prompt deliveries when called upon, unaffected by transportation difficulties. Storage facilities during the past year have been increased to the extent of 100,000 bales, or nearly a quarter of the total consumption of New Bedford mills, and are still inadequate. The New Bedford Storage Co. is authority for the statement that during this cotton season 1,500,000 bales will be used within a 35-mile radius of New Bedford. That city itself will take 450,000 bales. Fall River the same, and the mills around Providence, Taunton and elsewhere in the vicinity will take 600,000 bales more.

Two new tire fabric yarn mills are being erected; the Sharp with 100,000 spindles and the Manomet with 75,000, while the new Rotch mill with 350 to 400 looms, the first weaving mill in New Bedford to make tire fabrics, seems likely to be the forerunner of a new and highly profitable industry there which is only slightly seasonal in character. Motorists do not put up their

cars in winter as much as formerly and the demand for tire yarns is remarkably steady. It has been estimated that about 2,500,000 pounds are being purchased weekly. About 75 per cent of all New Bedford tire yarn is made of Sakellarides Egyptian cotton, the balance being Sea Island. Most yarns are 22½ to 23 count with some 20 count, usually combed though sometimes carded. For the most part they are sold single on section beams and the weaving mills ply them, usually elevenfold.

PROGRESS OF THE VICTOR RUBBER CO.

At the recent annual stockholders' meeting of The Victor Rubber Co., Springfield, Ohio, the following officers and directors were elected: H. H. Durr, president; F. R. Talbott, general manager and treasurer; Arthur Sackett, secretary; C. A. Swinchart, assistant general manager; H. J. Robben, vice-president; Ben Johnson, and John L. Bushnell.

General Manager Talbott reported satisfactory conditions for the year 1916 and even better prospects for this year. The plant has been in continuous operation night and day for over two years and although the company carries on a large business in rubber automobile mats, the principal increase has been in its pneumatic tires and tubes. A modern, second-story addition covering the present plant and more than doubling the floor space, will shortly be erected.

KING TUBELESS RUBBER CO. LOCATES AT YOUNGWOOD, PENNSYLVANIA.

The King Tubeless Rubber Co. has contracted for the purchase of the Fair Park at Youngwood, Pennsylvania, containing 30 acres and about 20 buildings of various sizes, about half of which can be readily adapted for tire manufacture, and the entire property will be reserved for expected future development. W. E. Russell is president of this company, which controls the use of all King Tubeless tire patents for the states of Pennsylvania and Maryland, under license from The Punctureless Auto Tire Co., Akron, Ohio, owner of the patents. The present branch office is at 3302 Grant Boulevard, Pittsburgh, Pennsylvania, and a Philadelphia, Pennsylvania, branch will be opened in the near future.

GORDON TIRE & RUBBER CO.

A stockholders' meeting of the Gordon Tire & Rubber Co., Canton, Ohio, has been called for February 28 for the purpose of voting to increase the capital stock from \$600,000 to \$1,000,000 to provide for enlargements of the plant now under way and to erect additions on the plot of land more than three acres in extent purchased recently from the city of Canton. Some of the additions will be completed and in operation by April 1, by which time the force will be increased from 200 to 300 hands. These enlargements are in the tire, tube and druggists' sundries departments. C. W. McKone has been promoted general superintendent. W. E. Ballsborough, formerly with the Star Rubber Co., Akron, Ohio, will have charge of the druggists' sundries department, succeeding M. B. Clark, who recently resigned. H. R. Platt, formerly with the Batavia Rubber Co., has been made superintendent of the tire and tube department.

At the last meeting of the directors C. W. Keplinger was re-elected president; H. B. McMaster, vice-president and general manager; C. J. Keplinger, secretary and treasurer, and they, with Isaac Harter, Judge Henry Harter, J. C. Keplinger, G. W. Ake and Samuel Ake, form the board of directors.

S. Hodge Smith, formerly at the Republic Rubber Co., Youngstown, Ohio, has been made superintendent of the Gillette Safety Tire Co., Eau Claire, Wisconsin.

A. A. Peterson will act as superintendent of the Globe Tire Co.'s plant at Laporte, Indiana.

CHAS. E. MILLER'S NEW BUILDING AT ANDERSON, INDIANA.

FIRST PAN-AMERICAN AERONAUTICAL EXPOSITION.

OF peculiarly timely interest, considering the present international situation, was the Pan-American Aeronautic Exposition at the Grand Central Palace, New York City, February 8 to 15, under the auspices of the Aero Club of America, the Pan-American Aeronautic Federation, and the American Society of Aeronautic Engineers.

Owing to the enterprise of the managers and of these associations, 25,000 or 30,000 tickets were sold in advance, and throughout the entire session the building was crowded with interested spectators. There were huge dirigibles, kite balloons, biplanes, monoplanes and other varieties of aircraft, accessories and war equipment. Special exhibits of remarkable interest were contributed by the United States Army and the United States Navy Aviation sections, Signal Corps, Weather Bureau and Bureau of Standards. There were more than 100 exhibitors.

Each day was devoted to some particular phase of the science of aeronautics and many men prominently interested in this line gave instructive addresses. Among those connected with the rubber industry who thus contributed were E. R. Preston, of the Goodyear Tire & Rubber Co., Akron, Ohio, whose address was "Coöperation with the Preparedness Movement"; Raymond B. Price, of the United States Rubber Co., New York City, spoke on "The Rubber Industry for Preparedness," and C. F. Smythe, of the Connecticut Air-Craft Co., New Haven, Connecticut, delivered an address on "Developing the Dirigible for Commercial Purposes."

Not many of the exhibits were directly connected with the rubber industry, but what they lacked in number they gained in prominence. Of course there were a number of rubber tires and shock absorbers for airplanes, but particularly interesting were the following exhibits:

The Connecticut Air-Craft Co. showed dirigibles and their housings. One of the company's dirigibles was suspended from the ceiling at the entrance of the Palace, and some types of the non-rigid Vedette for scouting and sporting purposes were also shown. The bags for these were made of a special fabric developed at the American factory of the United States Rubber Co., Cambridge, Massachusetts. The United States Rubber Co. also exhibited a line of balloon fabrics, a line of clothing and shoes for aviators, and a collection of mechanical sundries for airplanes, flying boats, etc., shock absorbers and rubber matting.

The Goodyear Tire & Rubber Co. exhibited a huge kite balloon such as was shown in the July, 1916, issue of THE INDIA RUBBER WORLD. This was suspended from the ceiling in the center of the exhibition hall and created great interest on behalf of the visitors.

One effect of the exhibit is the plan to purchase this kite balloon and present it to the government. The idea originated with Mrs. Charles A. Van Rensselaer, one of New York's most influential and public-spirited women. So strong was her desire to see the extension of the aeronautic defense arm of the government that she started a fund for the purchase of this balloon and the establishment of a training school for kite balloon operators, the plan being to locate this school at Governor's Island in New York Harbor.

THE ROYAL DUTCH CO. IN AMERICA.

The sale to Kuhn, Loeb & Co., New York City, of a block of shares of the Royal Dutch Co., principal competitor of the Standard Oil Co. in the world's markets, and owner of two petroleum producing companies in Oklahoma and California, seems to presage increased activity of this firm in the United States. It is known that the output of their wells is being greatly increased. In the absence of any authorized statement as to the intentions of the company, interested observers express the belief that in any event the new move will have a marked influence on the American gasoline and solvent naphtha situation.

AERONAUTIC MANUFACTURERS' ASSOCIATION.

ON February 9, during the First Pan-American Aeronautic Exposition in New York City, fifteen airplane manufacturers with a combined capital of \$30,000,000 and a total capacity of 175 machines a week, organized the Aeronautic Manufacturers' Association, pledged their full support and placed all their resources at the command of the government.

The organization will provide for the interchange of ideas concerning aeronautics of every kind and will arrange for the standardization of airplane manufacture.

The firms represented are: International Aircraft Co., Chicago, Illinois; The Burgess Co., Marblehead, Massachusetts; Curtiss Aeroplane & Motor Corporation, Buffalo, New York; Thomas-Morse Aircraft Corporation, Ithaca, New York; L. W. Flint Engineering Co., College Point, New York; United Eastern Aeroplane Co., Brooklyn, New York; Gallaudet Aircraft Corp., New York City; Brook Aircraft Co., Saginaw, Michigan; General Aeroplane Co., Detroit, Michigan; John D. Cooper Aeroplane Co., Bridgeport, Connecticut; Heinrich Aeroplane Co., Inc., New York City; Standard Aero Corp., Plainfield, New Jersey; S. S. Pierce Aeroplane Corp., Southampton, New York; The Benoist Corp., Sandusky, Ohio, and the American Motorplane Co.

AN AMERICAN AIRCRAFT FLEET.

The prospects are that henceforth rubberized fabrics for military purposes will be in greater demand than ever before. In accordance with its present policy of preparedness the United States Government contemplates the building of a formidable aircraft fleet and the work is already well under way. Early last month the government placed with The Burgess Co., Marblehead, Massachusetts, the largest order for airplanes and seaplanes ever given to one firm in this country. The number is not known, but as 200 men are already in the employ of the company and a new factory is in course of erection it is probably large, with the prospect of further orders. It is said that the new plant will be surpassed by only one other in the world.

An important conference was held in Washington the middle of the month, when the representatives of the United States Rubber Co., The B. F. Goodrich Co., the Goodyear Tire & Rubber Co., the Connecticut Aircraft Co. and the Curtiss Aeroplane & Motor Corp. met Rear Admiral David W. Taylor, chief constructor of the navy and head of the joint army-navy board of investigation of aerial problems. The conference resulted in an agreement whereby these firms will work together to furnish dirigibles for the use of the government.

The aeronautical department of the Goodyear Tire & Rubber Co., Akron, Ohio, is already at work on government contracts to construct war, kite and observation balloons, as well as to supply rubberized material for parachutes, ponchos, coats and blankets.

PROJECTED CASCADE TUNNEL WOULD BENEFIT THE RUBBER INDUSTRY.

Seattle, Washington, has latterly become an important port of entry for plantation rubber from the Far East. Manufacturers of rubber goods in the Middle West will therefore be glad to lend their hearty support to the project of General Henry M. Chittenden, chairman of the Seattle Port Commission, to build a 30-mile railway tunnel, the longest in the world, under the main range of the Cascade Mountains from Skykomish to Leavenworth, Washington. This would shorten the route 48 miles, lower the summit elevation 2,166 feet and reduce the running time of freight trains 8½ hours at a saving in maintenance to the Great Northern Railway which, together with the resulting traffic increase, would not render the estimated cost of \$50,000,000 unreasonable. It is to be hoped that the next decade may witness the realization of this gigantic scheme.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber footwear manufacturers in this state are unusually busy. There is a general complaint that it is impossible, or at least very difficult, to secure sufficient experienced help to keep the output up to the full capacity of the factories. At the same time the amount of orders already taken is far in excess of that at any previous year at corresponding date. These orders are for rubber overshoes, and for tennis lines. The latter style of footwear is to have a great boom, so it is predicted, as soon as warm weather comes, because of the high and still rising prices of leather shoes. The cheap "sneaker" is now simply a poor relation of the handsome styles of cloth top rubber-soled footwear, which, while originally designed only for sports and outing wear, will be worn for business and social wear also this coming summer.

* * *

The Plymouth Rubber Co., of Stoughton, shows a splendid record for the past year, its net sales being 28 per cent in excess of those for the year ending December 31, 1915; in fact, last

THE PLYMOUTH RUBBER CO.'S PLANT.

year's sales were the largest in the company's history, while the orders on hand for the present year are reported to be so large as to necessitate the erection of a new building as well as additions to some of the old buildings. Mention has been made of the plan to erect a reinforced concrete building 171 by 98 feet, 2 stories, but so built that another story may be added when occasion requires, this new building to be used entirely for the manufacture of rubber soles and heels, and to have a capacity of about 200,000 pairs per day.

The success of the company has been rapid. The present plant consists of 15 buildings ideally situated as regards transportation facilities on the spur track near the junction of two branches of the New York, New Haven & Hartford railroad, the majority of the buildings being less than 10 years old and some of the older having been largely added to and modernized. The plant has an effective water power.

The company manufactures "Slipknot" Safety heels and Durable Kompo soles, besides several lines of goods for the use of shoe manufacturers, and in addition to these, coated fabrics for the clothing trade, hospital sheetings, and artificial leather for the automobile and upholstery trade. We understand that a plan is under way to erect a three-story hotel, thus in part solving the housing problem for the employees of the company, and other improvements are in contemplation, though the plans are not yet sufficiently perfected to warrant publication.

* * *

Fred T. Ryder, the sales manager of the sole and heel business of the United States Rubber Co., started on a long trip the 17th of last month. His plans were to visit all the large cities between here and the Pacific Coast and interview the shoe jobbers

on the advantages of rubber soles. Many shoe manufacturers have adopted rubber soles for some of their lines, now that sole leather has doubled or trebled in cost, and Mr. Ryder's trip is mainly to secure the coöperation of the shoe wholesalers in further popularizing the use of rubber and fiber soles on moderate priced soles.

* * *

The rubber and fiber sole industry is receiving increased attention at the present time. A new enterprise is that of the Fibrehide Manufacturing Co., which has built a factory at South Braintree, for the purpose of manufacturing a line of soles and heels. This factory, which is two stories high and measures 240 by 160 feet, is expected to be ready for operation by the time this letter is read. The machinery is now being installed. The product is to be a rubberized felt, or a compressed body of cotton-felted fiber and rubber, vulcanized by a special patented process. The soles are "died out" from the sheet, thus doing away with the expensive process of molding, as is common with most rubber and fiber soles, an obvious advantage as regards cost of production. Frederick T. Ryder, Jr., is president and manager of the company and A. S. Dexter, of the Dexter Rubber Co., South Braintree, is the treasurer.

* * *

Large advertisements have appeared in the Boston papers, calling attention to the Pneumatic Cushion Inner Tube Co., which is now being organized for the purpose of manufacturing an invention of James P. Brophy, formerly superintendent of the Boggs Rubber Co., Birmingham, Alabama. The tube is of novel construction, having a combination of transverse and longitudinal "bulkheads," which form air compartments or cells, all connected. These cells are inflated, giving the air cushion effect of an ordinary inner tube, but in case of deflation, the

bulkheads are of sufficient strength to hold the resiliency, thus obviating the disagreeable necessity of replacing the inner tube on the road in case of accident. The tube is not yet on the market, but experimental sets have been run for more than a year with excellent service. The officers of the company are: President, George P. Brophy, treasurer of the automobile supply house of Brophy-Barrabee Co.; secretary and treasurer, Frank W. Hall, formerly general manager of the Boggs Rubber Manufacturing Co., of Birmingham, Alabama. James Brophy, the inventor of the tire, will be general manager of the new company.

* * *

The Batterman, Rood Rubber Co. is the name of a recent corporation, formed for the purpose of manufacturing rubber footwear. The capitalization is placed at \$150,000. It is the intention of the company to make a certain line of footholds and light rubbers for women, which can be retailed at a low price. The plans are to market the product in a somewhat original way, and through other retail establishments than regular shoe stores. The factory at Framingham is in charge of Arthur A. Cushman, formerly of Bristol, Rhode Island. The officers of the company are: Warren B. Rood, president; Robert W. Daniels, vice-president, and Thomas H. Dumper, secretary and treasurer.

* * *

At the annual meeting of the Alfred Hale Rubber Co., recently held in Boston, the stockholders elected David A. Cutler, Richard C. Storey, William G. Williams, William D. Lamond and Francis H. Swift, directors. The directors elected David A. Cutler president and treasurer and Richard C. Storey vice-president and clerk, and also voted to increase the capital stock from \$8,000

to \$18,000, declaring a stock dividend of 125 per cent for this purpose. The business of the last year has increased over the past five years by 150 per cent, and the company is planning to increase its facilities very materially in the near future.

* * *

The Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, plans to double its authorized common stock from \$2,000,000 to \$4,000,000.

* * *

The good ship "Hypatia," often referred to as the flag-ship of the Monatiquot Rubber Works Co., has been offered for war service to the government by her owner, James H. Stedman, treasurer of the company.

In case of necessity she will be assigned to the Scout Patrol fleet now being organized by the government, and made up of privately owned crafts. A power boat of the "Hypatia's" type is manned by a crew of five. She will carry a large gun forward and an anti-aircraft gun at the stern.

* * *

A number of young men employed in the branch store and the selling agency of the United States Rubber Co. in this city have formed a self-culture club, and will hold weekly meetings at the Boston Young Men's Christian Union building. The speaker on February 14 was W. E. Piper, superintendent of the Boston Rubber Shoe Co., Malden, who gave an instructive talk which was highly appreciated. At a later meeting Samuel S. C. Chilcote, assistant to President Hotchkiss of the General Rubber Co., spoke on plantation rubber. Mr. Piper succeeded Frank A. Locke as superintendent of the Boston Rubber Shoe Co.'s factories, when Colonel Locke was elected president of the Boston Young Men's Christian Union some years ago. Since then this latter institution has greatly broadened its field of usefulness and is doing splendid social and educational work, and much of this extension of influence must be credited to this ex-member of the rubber industry.

* * *

Norman W. Biggart, of Danbury, Connecticut, representative of the Mohawk Rubber Co., of Akron, Ohio, had an exciting experience on the morning of the 10th of last month when the Hotel Lenox of this city caught fire. Mr. Biggart occupied a room on the seventh floor, where his escape by the stairway was cut off. He was rescued, however, by firemen, who reached him by an aerial ladder and conducted him safely to the ground.

* * *

Another rubber man who had a similar experience was A. H. Kerr, of the Chicago, Illinois, branch of the United States Rubber Co. He was awakened by the roar of the fire, and when he opened his door, was met by the advancing flames. Going to the window, he threw out a pillow, to attract the attention of the firemen, who immediately placed a ladder to his window, so that he escaped without injury. Mr. Kerr is a salesman in the heel and sole department of the company, and attended a conference of that division in New York a few days previous.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE policy of The B. F. Goodrich Co. to encourage national military training is practically demonstrated in the offer of this company to employ Akron soldiers who enlisted and went to the border, in case they find their places in business houses filled on their return home. The operating committee states that the Goodrich factory can take care of all the soldiers from Akron who are able to qualify physically.

The \$10,000 prize given by the Goodrich company for the championship in driving contests throughout the year was recently awarded at the drivers' dinner at Chicago, Illinois, Dario Resta

receiving the lion's share. Resta used Silvertown tires exclusively throughout the 1916 racing season.

C. E. Cook.

* * *

C. E. Cook has been promoted to an important post at the Akron factory, in connection with the direction and operation of the 120 branches and stores and their thousands of employees selling Goodrich products. Mr. Cook was formerly manager of the Pacific Coast territory. As an evidence of the esteem in which he was held there his associates gave him a dinner and presented to him an elaborate silver service.

The Firestone Tire & Rubber Co. makes the interesting announcement that at last a circus is to be motorized by the United States Circus Corporation at a cost of \$1,000,000, and that the 100 3½-ton Kelly-Springfield trucks and 100 heavy Troy trailers necessary to move a six-ring show, together with the 1,200 persons, horses, menagerie and other miscellaneous paraphernalia are to be equipped with Giant single-tread solid tires. Never before has such an opportunity arisen to demonstrate conclusively the relative merits of single and dual tread tires for heavy transportation.

W. A. Bryan has been appointed to fill the recently created position of master mechanic at the Firestone factory. Mr. Bryan was formerly superintendent of the Akron motor truck plant of the International Harvester Corporation.

Two industrial fellowships in the study of the chemistry of india rubber have been established at the Municipal University of Akron, one by the Firestone Tire & Rubber Co. and the other by the Goodyear Tire & Rubber Co. These fellowships will yield \$300 per year each and will be open to graduates of standard American colleges who have completed a thorough college course in chemistry and are recognized as students of excellent ability. By action of the directors of the university, the holder will be exempt from all fees and will render certain services in instruction and laboratory supervision. At the end of the year of work at the Municipal University the holder of the fellowship will enter the employ of the company which has provided the fellowship, with the advantage of the basic knowledge of rubber chemistry acquired at the laboratory of the university.

* * *

The American Rubber & Tire Co. has let the contract for a 108 by 40-foot, four-story building of steel and brick construction, up-to-date in every respect. This addition will be used for the general extension of all departments of the plant, especially for the manufacture of the company's "Triple A" pneumatic tire and for the cord tire recently added to its line.

The capital stock of the company has been increased from \$500,000 to \$1,000,000, \$250,000 of which will be issued immediately. As this amount has already been provided for, the stock will not be offered to the general public.

* * *

At the recent annual meeting of the Akron Rubber Mold & Machine Co. the largest business in the history of the company was reported, and it was voted to buy further machinery and increase the production in 1917. The regular dividend was declared and officers reelected for the ensuing year, as follows: S. W. Harris, president and general manager; W. E. Wilson, vice-president and assistant general manager, and G. F. Hobach, secretary and treasurer.

This company has purchased about eight acres of ground, besides two tracts adjoining the present plant, for enlargement purposes, but has not yet decided when to build on the newly acquired property.

The Miller Rubber Co. increased its total sales from \$3,216,000 in 1915 to \$7,583,605.95 in 1916 with prospects from \$10,000,000 to \$12,000,000 sales for 1917. The 1916 figures are for 15 months, owing to a change in the fiscal year.

The surplus on October 1, 1915, was \$831,746.99. Earnings on October 1, 1915, to December 31, 1916, were \$952,952 with a total of \$1,784,699 less the common stock dividend of \$1,000,000 depreciation and expenses of increased capitalization of \$232,795.84 and dividends of \$259,958. With a total of \$1,592,753.94, the surplus on December 31, 1916, was \$291,945.

The company will issue \$500,000 in new common stock. Present shareholders will have the right to purchase shares of the new stock at par.

During 1916 the company doubled its factory and land holdings and is at present erecting a seven-story addition.

* * *

The admirable new plant of the American Hard Rubber Co., comprising buildings covering nearly ten acres, is equipped with the most modern machinery and appliances for the manufacture of hard rubber goods. The architect was Walter Kidde & Co., Inc., 140 Cedar street, New York City, who specializes in rubber mill construction.

* * *

At the annual meeting of the Amazon Tire & Rubber Co. the following officers were elected: L. J. Schott, president; L. F. Smith, vice-president; C. E. Bettler, treasurer; Dr. F. B. Richards and Albert Kroehle, directors, in addition to the officers. The company is building a standard pneumatic tire with an extra side-wall breaker strip or blow-out protection and reports a monthly increase in sales of about 140 per cent.

* * *

The Akron Biltwell Tire & Rubber Co., with executive offices at 405 Ohio Building, is having plans prepared for a new plant. The first unit will be four stories high, 100 by 200 feet, with power plant, the first story to be of reinforced concrete, fireproof construction. A large number of Cleveland people are stockholders in the new firm.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

MANUFACTURERS of rubber goods of every description in Rhode Island are working to capacity, with no apparent indication of cessation of the extraordinary demands.

The scarcity of desirable help still confronts the managers and is, perhaps, one of the most exasperating and ever present problems with which they have to contend. Because of this shortage several concerns, that would otherwise have built, have refrained from making additions to their plants. However, the aggregate output of the rubber factories of Rhode Island for the past two years has been something enormous, establishing a new record for the industry, and the end does not yet appear to be in sight.

* * *

The National India Rubber Co.'s plant at Bristol has been handicapped during the past few weeks on account of the congestion of freight, the local railroads having been utterly unable to move the accumulating output. The establishment is still engaged on an extraordinarily large order of tennis shoes and will undoubtedly be pushed to its utmost for a number of months to come.

* * *

A two-story brick addition is being built to the box shop of the Alice mill of the Woonsocket Rubber Co., at Woonsocket. When completed it will be used in the manufacture of paper boxes for packing the company's goods.

* * *

The Davol Rubber Co. is making extensive alterations in the three-story brick building at its plant in order to afford additional room for several departments.

The Mechanical Fabric Co., Providence, has recently discharged a mortgage of \$28,000 held against its real estate by Lotta P. Kelley.

* * *

The Town Council of East Providence has voted to purchase 300 feet of fire hose for use of the town's fire companies. Of this 150 feet has been purchased from the Boston Woven & Rubber Hose Co., and 150 feet from the Quaker City Hose Co.

* * *

The BeSaw Tire Co., 50 Franklin street, Providence, is being conducted by A. C. Bartlett, according to information filed at the office of the city clerk.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

SIX men employed in the vulcanizing department of the Luzerne Rubber Co. narrowly escaped death, though unscathed, when one of the huge vulcanizers blew up, demolishing one entire wall of the building and shattering windows in another factory some distance away. The only explanation that has been made is that there must have been defective metal in the vulcanizer. It was not an old apparatus and those in charge claim that everything was apparently in good order a short time before the accident. While the damage done to the building is considerable, the chief concern of the company is to get things in shape for turning out of orders, as the plant is rushed with business.

* * *

The Empire Rubber & Tire Co. is to be reorganized under the name of the Empire Tire and Rubber Corporation, with a capital stock of \$6,000,000, of which \$1,500,000 is preferred, \$3,000,000 common, issued, and \$1,500,000 reserved in treasury for converting preferred.

* * *

The Globe Rubber Manufacturing Co. recently awarded a contract for a large brick addition to its plant on Prospect street.

* * *

Efforts are being made by the Trenton Chamber of Commerce to have the Ford Motor Co. locate a plant in Trenton. This action follows the decision of Henry Ford to not erect a plant at Harrison, New Jersey, as he had contemplated doing. Rubber tire manufacturers are interested in the outcome of the negotiations.

* * *

The Automobile Owners Co-operative Association, organized in this city to supply tires to members, is said to be contemplating the equipment of a factory for making tires. It is said there have been large numbers of near-by motorists to subscribe for stock in the concern.

* * *

The Trenton Automobile Show will be held in the Second Regiment Armory from March 21 to 24, inclusive. Tires and other rubber goods will be elaborately displayed in the section devoted to automobile accessories.

A SYNTHETIC RUBBER ENTERPRISE.

The latest synthetic rubber proposition has been launched in Tacoma, Washington, by Morton Gregory, who proposes to produce rubber from Puget Sound products.

Mr. Gregory, who has been experimenting for several years, claims that the feasibility of his process has been demonstrated in a number of laboratories during the past year. He has leased 3,800 square feet of municipal dock property on which to conduct his operations. It is stated that the project has been adequately financed by eastern capital.

TIRES CARRY MORE THAN STEEL RAILS.

RUBBER-TIRED vehicles provided a passenger and freight service in the United States estimated at \$1,725,000,000 for the year 1916, a total so enormous that more and better highways now constitute the greatest transportation need in America. This conclusion was based upon the startling figures presented by Alfred Reeves, general manager of the National Automobile Chamber of Commerce, at the highway engineering meeting held in New York, December 28. They show that automobiles are now rendering a greater passenger transportation service than all the steam railways of the country, or than all the urban and interurban electric roads combined, and that the automobile freight traffic is also assuming enormous proportions.

According to the Bureau of Railway Economics the steam railroads carried 1,053,000,000 passengers in 1914, with little increase in 1916, an average distance of 33 6/10 miles, or a total of 35 1/4 billion passenger miles, and earned a revenue of \$700,400,000 on this service. By comparison, the 3 1/4 million passenger automobiles now registered in the country, averaging 5,000 miles a year, and three passengers per car, gave a service of 48 3/4 billion passenger miles, worth 975 million dollars on the railroad basis of two cents per mile, or over 200 million more than the railroad passenger service.

The street and electric railroads carried 9 1/2 billion passengers in 1912 (the latest year for which official figures were available). The average distance traveled was four miles, making 38 billion passenger miles. This produced a little more than half a billion dollars, averaging 1 1/3 cents a mile. At this rate of fare, the automobiles rendered a service this year of 598 1/2 million dollars, or about 98 million more than the street railways.

The 250,000 commercial motor vehicles in the country, averaging 50 miles a day, half the distance with an average load of two tons, give a total of 3 3/4 billion ton-miles annually. Taking 20 cents per ton-mile as a fair average cost of hauling by horse-drawn vehicle on the public roads, this is worth 750 million dollars a year.

SCALE FOR WEIGHING TIRE CASINGS.

A convenient accessory to facilitate the weighing of tire casings is shown here in connection with a hanging scale. This consists of a hook of sheet metal, so formed as to receive readily and firmly hold the tire. The scale, which is of the "no spring" variety, is furnished with a 100-pound chart graduated to quarter-pound divisions, or with a 50-pound chart having two-ounce graduations if preferred. The entire arrangement can be so placed at some convenient point on the shipping room wall, that the adjustment of the tire and the reading of the register are almost instantaneous. [Toledo Scale Co., Toledo, Ohio.]

PORTABLE TUBE VULCANIZERS.

Two very light and simple tube vulcanizers of the pocket variety have been offered to the motorist trade recently. In appearance they resemble nothing more than an ordinary clamp, the upper jaw of which forms the heating pan, while the clamp is tightened on the part to be repaired by a thumb screw.

In the Low vulcanizer the heat is furnished by a disk

LOW'S FIVE MINUTE VULCANIZER.

of cardboard saturated with a combustible which, when placed in the pan and ignited, will burn without flame, and produce the correct heat for curing. The

MARVEL JUNIOR VULCANIZER.

Marvel Junior uses a composition fuel tablet that burns slowly, yet radiates sufficient heat to cure the repair properly.

KEYSTONE ADJUSTABLE BLOW-OUT PATCH.

This blow-out patch is made of rubber and fabric, and, it is claimed, eliminates the common difficulty caused by the tire swelling after a patch is placed over the crack and thereby gradually forcing the patch through the hole by the pressure of the inner tube. This improved tire accessory, which has recently been patented, is applied as follows:

The inner tube is blown up to its normal size, which will nearly fit the inside of the casing, as is customary when inserting the inner tube at any time. The patch is then put

and the strip which will be seen in the illustration is wrapped around the patch, which is then put in the casing over the crack and the tire put on the rim as usual. When the tire is inflated, the blow-out patch, if not backed enough to fit the tire, will allow the strip to unwrap until the patch comes in contact with the inside of the casing and the pressure of the patch against the casing prevents it from unwrapping any further. In this manner the inner tube is tied down and the pressure is taken off of the casing and is on the patch instead, and therefore will not cause the tire to swell.

These patches are supplied in three sizes: No. 1 fits a 3 and 3 1/2-inch tire; No. 2 fits 4 and 4 1/2-inch tires, and No. 3 fits 5 and 5 1/2-inch tires. [Keystone Rubber Manufacturing Co., Erie, Pennsylvania.]

The addition to the shipping department of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, now in process of erection, will double its capacity and assure the prompt and efficient handling of the company's rapidly growing business.

The Birch-Hintz Manufacturing Co., maker of "Birch" pump valves, rubber molds and machinery for rubber factories, is now located in its new factory building at 1000-1100 South Kilbourn Avenue, Chicago, Illinois.

The Rubber Trade in Great Britain.

By a Special Correspondent.

NOT for several years has the winter been so severe and inclement. The rivers have been frozen, and the snow deep and lasting. This has caused a heavy demand for galoshes, and, at the present time a scarcity which is very discouraging to dealers. The streets have been in an execrable condition for weeks, and the run on overshoes is extraordinary. Indeed, one dealer reports having sold over 1,000 pairs in a single day. Many dealers sold their entire stocks and could not restock, but others were able to get Canadian or United States goods. The latter, though 50 to 75 per cent higher in price (at the retail shops) than British made overshoes, do not wear so long, because the Americans sacrifice durability for appearance. It must be confessed that the imported shoes are more attractive.

Rubber footwear manufacturers have been and are now running their works to the utmost capacity, mainly on government orders. Trench boots, overshoes and overboots are absolutely essential to our brave men at the front. Whilst our manufacturers have been so engaged, it has been necessary to import civilian galoshes, and hundreds of thousands of cases of these have come from American manufacturers, who are also capturing the foreign trade which our manufacturers cannot supply, whilst their whole output is taken up for war requirements. When the war is over and the government war orders cease, our manufacturers will have a strong fight to get back the business which has been captured by foreign competitors.

MECHANICALS EXPORTS SUFFER.

The same situation is noted in the export of mechanical rubber goods and asbestos packing to Latin-American countries. As an example, it is stated that the importations of rubber and asbestos packing and mechanical goods by Brazil and Argentina during the five years immediately preceding the war were:

	Kilos.	£ Sterling.
1909.....	243,766	15,422
1910.....	282,946	17,974
1911.....	258,599	17,061
1912.....	353,779	20,452
1913.....	367,958	22,535

Of this trade Great Britain supplied some 45 per cent, Germany following with 40 per cent, Belgium with 5 per cent, and the United States with less than 3 per cent. Since the war the position has been entirely changed; of German exports there remain scarcely any, while the United States, profiting by the situation, has increased its trade with Argentina and Brazil by some 200 and more per cent.

PROOFING TRADE GOOD.

The proofing trade has been excellent also. This is particularly the case with those works where government orders are being filled. Especially busy are those who are proofing fabric for balloons and aeroplanes. This class of fabrics requires the highest quality of workmanship and material. Then the orders for trench capes and ground sheets for the government have monopolized the entire capacity of the works. Complaints are not rare that while the government practically commandeers the whole output, there are doubts about renewals when present contracts are completed.

Fears are entertained that cloth for proofing may become scarce. This may not be unfounded, but with the large importations of cotton, it would seem that such scarcity could not be because of want of raw material. The lack of labor in the textile works due to enlistments has greatly affected the output. This may be relieved to some extent in the Manchester district by the agreement between the labor unions and the Federation of Master Cotton Spinners Association whereby during the continuance of the war the rules may be relaxed to the extent that females and youths may work in some branches.

PETROL CONSERVATION.

Tire people are worrying over the new rulings of the Petrol Committee which has refused to renew all full duty motor spirit licenses unless the holders are engaged in work of national importance in which continued use of the motor car or motorcycle is essential. Licenses now in force hold good until March 31 for motorcycles and till April 30 for private cars. On February 7 the use of petrol for char-a-bancs was prohibited. It is feared that this action will completely abolish pleasure motoring, and curtail the use of motor cars by business men to a great extent. In such case the tire industry must naturally suffer.

DUNLOP'S PROSPEROUS YEAR.

However, the tire business is not yet in the dumps, if one may consider that the net profit of the Dunlop Rubber Co., Limited, for the year 1916 was £432,400, the allocations £227,000, and the carry-forward £82,900. And besides this the company paid dividends of 15 per cent. The company found great difficulty in maintaining its labor force. The scope of the company's business had been widened, they had paid greatly enhanced wages, salaries and working expenses generally, without raising retail prices.

WORKING OVERTIME.

All the tire concerns report good business, the government orders more than making up for any falling off in civilian demand. Not only the tire factories but many in general lines are working to double capacity by employing double forces. A specially notable case is that of the Midland Rubber Co., whose works remain inoperative but six hours in the week. This stoppage is from noon till six at night on Saturdays. The works are running continuously, Sundays included, the rest of the time.

COMMERCIAL FAIRS.

The British Industries Fair is to be held at the Victoria and Albert Museum, and at the Imperial Institute Building from February 26 to March 9. In view of the risk of interference with the output of munitions of war, it has not been possible to include in this fair certain trades which otherwise would have been invited to participate. The rubber trade is one which is thus excluded. The trades represented are the same as a year ago, namely toys and games; earthenware and china; glass; fancy goods; stationery and printing. A new and important development in this matter is the adoption of the fair principle by the municipality of Glasgow, on the same dates when the fair will be held there. The fair in Glasgow, which is to be held under the auspices of the Board of Trade of that city will be confined to textiles; ready made clothing; boots and shoes; foodstuffs; and domestic chemicals. Over 100,000 invitations to attend both fairs have been sent out to buyers in these trades.

MOTORCYCLES SOLD WELL.

In re the petrol curtailment, a side light on its effect is in the matter of motorcycles. Operatives in many lines of industry have been earning larger wages, and the consequence has been a wonderful increase in the sales of motorcycles, many ordinary workpeople buying them to save tramcar fares. Now that their licenses are refused renewal, and they are unable to get petrol for motive power, the machines must remain useless, unless some substitute is obtainable. Here is a chance for some of your American inventors to come to the rescue.

The general opinion is that the war cannot last through the present year, and with this in view plans are being discussed for readjustment of wages. The Chamber of Commerce recommends the following:

As regards the remuneration of employes, the principle of payment by results should, as far as possible, be adopted by employers and employed.

The basis of rates of payment for labor should involve such a scale as will insure for all willing and efficient workers a fair and reasonable standard of living.

The government should afford opportunities for considering the amendment of the trade disputes acts and of any provision of the factory and workshop acts other than those relating to the health of the workers.

Encouragement should be given, as far as possible, to profit-sharing and co-partnership agreements, or premium and bonus systems on lines which have proved beneficial to employers and employed in the past, subject to the special conditions of particular trades, and to the maintenance of the standard rates of wages.

CHEMICAL MANUFACTURERS ORGANIZE.

The Association of British Chemical Manufacturers has recently been organized to promote coöperation between manufacturers of chemicals and other allied products, to develop technical organization, to promote industrial research, efficiency and advancement. The management consists of twenty, and there are committees of various divisions. Group 8 treats of cellulose products, rubber and substitutes, and Group 5 distillation of coal shales, coal tar primary products. I have not been able to obtain the names of the committees of these groups up to time of writing.

LONDON AS A RUBBER MARKET.

THE following significant paragraph under the heading above, which is reprinted from "The India Rubber Journal" of January 27, indicates that British rubber associations are alive to the recent trend of the trade and may advocate stringent measures to protect London's prestige as the world's great rubber market:

The growth of direct shipments from the Straits and Ceylon to the U. S. A. has been watched by the London rubber market with some alarm, though the view has been confidently expressed in some quarters that London, because of its financial power, will reassert its superiority as a rubber center after the war. The exchange difficulty now manifesting itself in the East may be the straw which shows the direction the wind is blowing. The fact should not be lost sight of that the government have it in their power to divert the whole trade in British-grown rubber so that it passes through London and Liverpool. For various reasons this may be found expedient, and we shall not be surprised if it comes about.

AUSTRALIAN "HOMING" MOTOR TIRES.

Under this title the January 1, 1917, issue of the weekly bulletin of the Canadian Department of Trade and Commerce publishes an interesting article on the use of fiber tires for emergency purposes in Australia.

As in all other countries of vast distances and comparatively few traveling facilities, the advent of the motor car in Australia has, to a very considerable extent, solved the difficulties of transportation. In many parts of the country the roads are merely bush tracks or overland stock routes, on which herds of cattle are driven long distances to the city markets or coastal freezing works.

The rough nature of the country over which automobiles have to travel and the excessive heat often experienced have made the cost of rubber tires a serious item in maintenance, thereby causing many experiments to obtain a substitute for rubber at a moderate cost. The invention and recent perfection of the Australian "homing" tire is claimed to have met the emergency at a comparatively small cost. Tests with tires made of various kinds of fiber were carried out, with the result that coir fiber was found to be the most suitable for the purpose because of its lightness, cheapness, resilience, and durability. The greatest difficulty was to discover a method of joining the ends of the rope to make a complete circle of the same size, but eventually a new splice was invented, and the tire as now sold in Australia is said to be perfect of its type.

When first placed on the market the "homing" tire was sold as an emergency tire in case of a puncture or blow-out, but it

proved so satisfactory that in the country districts of some of the states the rope tires are frequently used on all the wheels of automobiles, particularly for station or ranch work and over rough and stony country.

The tires are bullet, nail and glass proof, and if a speed of 16 miles per hour is not exceeded it is claimed that they are almost as soft riding as pneumatic tires. It should be understood that the "homing" tire takes the place of both inner tube and cover, being attached to the rim by four or five straps.

THE RUBBER TRADE IN GERMANY.

By Our Regular Correspondent.

IN the bitter struggle for existence in which Germany is now plunged, it is difficult to write freely. One would like to do so, but one never can tell how vitally important some apparently innocent information may be. However, I believe that no secrets will be violated in telling you that those of our industries that have been working on government orders have, notwithstanding large contributions to war loans and various relief funds, made enormous profits, and that this "boom" period is being utilized for the purpose of carrying on vast mergers. Some of the industrial profits for the fiscal year 1915-16 were astonishing. The net profit of 19 representative rubber companies was 12,000,000 marks [\$2,756,000], against 10,000,000 marks [\$2,380,000] the year before. When this war comes to an end our rubber industry will be possessed of greater organization, efficiency and wealth than ever before, and we believe we know how to see that it will not lack raw materials. This brings me to synthetic rubber.

SYNTHETIC RUBBER.

As I have written repeatedly, I do not believe that synthetic rubber will remain an important factor when peace is reestablished. Our non-technical papers derive much satisfaction from the sarcasm they exercise in thanking our enemies for forcing

Underwood & Underwood, New York.

SPRING WHEELS USED ON GERMAN AUTOMOBILES.

us to develop rapidly an invention which otherwise might have grown only slowly in the course of ages; but the fact remains that synthetic rubber is very costly and only suitable for a limited number of purposes. For tires, for instance, I do not believe artificial rubber will ever be able to compete with the natural product, and my belief is sustained by the number of bicycle tire substitutes which are offered and which contain no synthetic rubber, in fact any kind of rubber. The substances

most used are steel wire, leather, wood, prepared canvas, rubber substitute, and combinations of these substances.

WIRE TIRES.

The wire tire is made of steel wire, about 3/16 inch thick, which is worked into a very close coil, the two ends being welded together, so as to give it the proper shape. This product now sells wholesale at 12 marks [\$2.86], and retails at 18 marks [\$4.28], which is considerably more than the average price for rubber cycle tires just prior to the war. Besides its high price, the steel-coil tire has the additional objection that it cuts into the roads, is far less resilient than pneumatics, and is very noisy in use. Some users are said to have overcome the latter objection by inserting a layer of felt between the rim and the tire, but this certainly adds much to the cost of the tires.

WOODEN TIRES.

Wooden cycle tires, due to their low cost, have met with fair success. There are various types of these and they retail at from 4 to 6 marks [\$0.95 to \$1.43] apiece. Some are in one piece, others are sectional. The Continental Caoutchouc und Gutta-Percha Compagnie, of Hanover, is producing sectional wooden tires that are meeting with marked success. They are composed of 47 parts, which include 12 wooden tire sections of 3 different kinds, 12 tin plates, 12 screws, 10 connecting pins, and one thumbscrew. The tin plates are used to secure the sections to the rim, which must be of metal itself; the screws serve to attach the tin plates to the ends of the wooden sections; the connecting pins hold the sections together, and the thumbscrew is on a spindle put through the valve hole in the rim and is used to tighten the tire on the rim. This special type sells retail at 6 marks [\$1.43], which would be exceedingly satisfactory if it represented the whole cost to substitute rubber tires. In reality the expense is more than double, for in order to obtain reasonably easy riding qualities, the fork of the cycle has to be provided with shock absorbing springs, which are marketed by the Continental company and which retail at 7.50 marks [\$1.78]. This places the total cost of a set of tires at 19.50 marks [\$4.64].

Another type of wooden tire is made of one piece of wood, the outer surface of which is covered with a narrow strip of leather. Between the inside surface of the wooden tire and the rim several steel springs are placed, with a view to providing some elasticity. In addition to this both front and rear forks of the cycles are of the "cushion frame" type, provided with large, shock-absorbing steel springs. The cost of this outfit, including the two tires and the large springs, is 36 marks [\$8.57].

LEATHER AND CANVAS TIRES.

Several leather-covered and canvas-covered tires are made and sold. These are solid, the outer casings being of leather or prepared canvas, and the inner part consisting of wood and similar substances. To make this type of tire more durable, a steel tread is often provided. Prices for these tires vary; one fairly good leather-covered tire retails for 48 marks a set [\$11.42]; another for 70 marks [\$16.66].

"LOBO" TIRE.

The tire that has the strongest claim to being a real substitute for the rubber article is marketed under the trade name of "Lobo." It is the product of the Kunstgummi Gesellschaft, m. b. H. (Artificial Rubber Co.) of Chemnitz, Saxony, and is composed of 2 parts, corresponding to the inner tubes and outer casings of peace times. The inner part, which is the most important, is solid and is covered with cloth made into the shape of a tire. The tube thus formed is filled with a preparation in the nature of rubber substitute. The casing is built up of prepared canvas, and wears tolerably well. The price for a set of these tires is 52 marks [\$12.38], and is of course sufficient to restrict their use, so that it can be said that of all the cycle tires now offered and used, the sectional wooden tire of the Continental company is the most practical from the point of view of both price and service.

RUBBER PLANTING NOTES.

CEYLON RUBBER AUCTIONS POSTPONED.

REPORTS recently received give every indication of at least a temporary derangement in the financial transactions of this locality, caused by certain restrictions imposed by the India Council, thereby seriously impeding business in general, and further resulting in the postponement of the rubber sales.

It is generally expected, however, that immediate remedial measures will be adopted. Efforts are being made to place the labor situation on a more satisfactory basis than it has been for some time past.

CEYLON REPORT FOR 1915.

The Ceylon Report for 1915 has just been issued.

The year 1915 witnessed a considerable increase in the output of crude rubber, as young plantations came into bearing, and older ones increased their yield through better cultivation and tapping.

The area under *Hevea* rubber was approximately 240,500 acres, almost entirely in the hands of European planters, and ranged from sea level to 2,000 feet. Few new plantings were made, owing to lack of suitable available land, as *Hevea* does not thrive in the dry northern districts of the island, even under irrigation.

By far the greater amount of rubber was shipped as crêpe, though a certain amount of smoked sheet and biscuit was also made. Prices ruled satisfactorily throughout the year, the average price being 1.65 rupees [54 cents] per pound.

Experiments in the upbringing of plantations with green manure, seed selection, wide spacing, artificial manuring, and the best methods of tapping were carried out. Experts were engaged in research work connected with the physical problems concerning the tree, the latex, and rubber, and with the fungus diseases attacking plantation *Hevea* trees, which were somewhat serious in the wetter districts.

EXPORTS.

Exports of crude rubber constituted a record, the quantity being 43,574,800 pounds for 1915.

The United Kingdom and the United States continued as the principal buyers, their purchases being 55.12 per cent and 39.72 per cent respectively of the total, as against 62.9 per cent and 23.19 per cent in 1914.

Besides the United States, France, and Russia, the only other foreign country to be supplied was Japan, due to restrictions necessitated by the war.

EXPORT DUTY.

Under Ordinance No. 17 of 1869, as amended by Ordinance No. 5 of 1914, the export duty levied on crude rubber from October 1, 1915, is 7.50 rupees [\$2.48] per 100 pound.

IMPORTS OF RUBBER GOODS AT HAIKWAN, CHINA.

The Chinese Imperial Customs have just issued a volume giving the countries of origin of the principal imports into China during 1914-15. The following are the Haikwan imports of manufactures of rubber and gutta percha:

From—	Haikwan 1914.	Haikwan 1915.	Haikwan Increase or Decrease.
Great Britain	46,000	31,000	— 9,000
Germany	9,000	— 9,000
France	14,000	21,000	+ 7,000
Russia	186,000	90,000	— 96,000
Japan	47,000	202,000	+ 155,000
Other countries	34,000	41,000	+ 7,000
Totals	330,000*	385,000	+ 55,000

* Includes 58,000 Haikwan taels reexported.

[The legal value of the Haikwan tael is .807 cents United States currency.]

 1,213,476. Pneumatic tire shoe. C. F. A. Gray, Montreal, Quebec, Canada.
 1,213,557. Cushion tire. J. T. Trotter, New York City.
 1,213,571. Combined bathing-cap and suit-bag. J. Zuckerman, New York City.
 1,213,606. Breast pump. J. T. Emott, Morristown, N. J., assignor to Puritan Chemical Co., a corporation of Massachusetts.
 1,213,697. Inner tube for pneumatic tires. B. C. Seaton, Nashville, Tenn.
 1,213,719. Cushion tire. J. F. White, Pittsburgh, Pa.
 1,213,725. Fountain pen. O. R. Anderson, Elizabeth, N. J., assignor to Eagle Pencil Co., New York City.
 1,213,726. Impregnated coil and method of making same. L. H. Baekeland, Yonkers, N. Y., assignor to General Bakelite Co., New York City.
 1,213,735. Air-tube for a pneumatic tire. H. Brown, Putney Hill, London, England.

ISSUED JANUARY 30, 1917.

- 1,213,814. Teat cup for milking machines. G. O. Anderson, Lancaster, Pa.
 1,213,834. Elastic wheel tire. R. Bunzlau and C. L. Stoll, assignors to the Firm "Sembusto" Elastische Radbereifungen Gesellschaft M. B. H.—all in Vienna, Austria-Hungary.
 1,213,949. Anti-skidding grip-tread for vehicle wheels. C. Reger, Danville, Pa.
 1,213,950. Cushion for billiard tables. E. Ringsmith, Morenci, Ariz.
 1,213,951. Recoil pad for gun butts. E. Ringsmith, Morenci, Ariz.
 1,213,967. Tire tool. M. H. Stewart, Detroit, Mich.
 1,214,004. Tire valve. J. A. Bowden, Los Angeles, Calif., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
 1,214,028. Toy mustache with rubber part. F. H. Hainert, Jr., Minneapolis, Minn.
 1,214,065. Rubber pad for the soles and heels of boots and shoes. W. W. Phillips, London, England.
 1,214,072. Fountain drawing pen. T. J. M. Reynders, Rotterdam, Netherlands.
 1,214,087. Self-filling fountain pen. M. Shemin, Bayonne, assignor to J. L. Valentine, Jersey City—both in New Jersey.
 1,214,137. Resilient tire. L. E. Clawson, San Francisco, Calif.
 1,214,155. Tire. C. W. Gutzzeit, New York City.
 1,214,174. Resilient tire. L. H. Klocksien, Paton, Iowa.
 1,214,268. Air bag for mending pneumatic tires. J. W. Blodgett, Chicago, Ill.
 1,214,273. Tire protector. J. R. Cabanne, Seattle, Wash.
 1,214,291. Cushion tire. F. Fitzharris, assignor of one-half to E. J. Nixon—both of Texarkana, Tex.
 1,214,310. Fountain pen. S. Josselyn, Atlantic, assignor of one-half to S. C. Crocker, Boston—both in Massachusetts.
 1,214,321. Pneumatic tire. W. E. King, Topeka, Kans.
 1,214,478. Life saving suit. G. W. Magnus and J. O'Banion, Seattle, Wash.

ISSUED FEBRUARY 6, 1917.

- 1,214,537. Metal-studded tire. J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
 1,214,543. Elastic webbing hose supporting garters. M. B. Hammond, assignor to The Thomas B. Taylor Co.—both of Bridgeport, Conn.
 1,214,566. Resilient tire. G. F. Mallaby, East Cleveland, Ohio, assignor to Kelly-Springfield Tire Co.
 1,214,666. Composition sole for boots and shoes. J. A. Ford, Jamaica Plain, assignor to Plymouth Rubber Co., Canton—both in Massachusetts.
 1,214,670. Pneumatic tire comprising a breaker strip of soft rubber mixed with shredded fiber. W. C. Geer, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
 1,214,777. Anti-skid device for wheels. C. G. Greenleaf, West Richfield, Ohio.
 1,214,781. Pneumatic tire pressure gage. C. Harrison and K. Lamond, assignors to Vancouver Motors Supply, Limited—all of Vancouver, British Columbia, Canada.
 1,214,807. Rim tool for automobile rims. G. E. Lundberg, Kewanee, Ill.
 1,214,811. Pneumatic vehicle wheel. L. Mayolino, assignor to Ruedas y Neumaticos Mayolino—both of Habana, Cuba.
 1,214,830. Moisture-proof switchboard cord. W. L. Runzel, assignor to Runzel-Lenz Electric Manufacturing Co.—both of Chicago, Ill.
 1,214,889. Sole for rubber shoes. S. W. Bourn, Providence, R. I.
 1,214,959. Illuminated fountain pen. E. O. Schaffer, Derby, Conn.

- 1,215,050. Hose coupling. F. X. Muller, assignor to Republic Hose Coupler Corporation—both of Buffalo, N. Y.
 1,215,064. Semi-metallic sheet comprising asbestos fiber, rubber, shredded metal and a filler. L. L. Ryan, assignor to The Royal Equipment Co.—both of Bridgeport, Conn.
 1,215,111. Cascade fountain for internal baths. E. Carlsen, Chicago, Ill.
 1,215,179. Anti-skidding attachment. A. Montanari, Pensacola, Fla.
 1,215,216. Non-skid tire. J. L. Swartz, Akron, Ohio.
 1,215,301. Portable track and tire protector. J. B. Munson and P. F. Hagerty, Phillipsburg, N. J.
 1,215,311. Bathing cap, embodying a flexible water proof body and a band of sponge rubber. Thomas W. Miller, assignor to The Faultless Rubber Co.—both of Ashland, Ohio.

ISSUED FEBRUARY 13, 1917.

- 1,215,349. Tool for repairing tires. C. Dierig, Lawrence, Mass.
 1,215,382. Art of making mottled rubber flooring. A. B. Kempel, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
 1,215,449. Rubber soled shoe. M. W. White, Cliftondale, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
 1,215,450. Rubber sole shoe. M. W. White, Cliftondale, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
 1,215,475. Apparatus for nasal douches, injections and other like purposes. W. G. Brokaw, Paris, France.
 1,215,486. Vehicle wheel tire. M. Clark, Chicago, Ill.
 1,215,538. Eraser for fountain pen caps. W. G. Ihne, Chicago, Ill.
 1,215,577. Cushion tire. L. R. Reeder, assignor of one-half to W. J. Quillen—both of Akron, Ohio.
 1,215,582. Tire repair plug. R. W. Sampson, Melba, Whitestone, N. Y., assignor of one-half to L. Schwab, East Orange, N. J.
 1,215,717. Pneumatic tire. A. F. Ruthven, Kansas City, Mo.
 1,215,719. Tire plug. R. W. Sampson, Melba, Whitestone, N. Y., assignor of one-half to L. Schwab, East Orange, N. J.
 1,215,782. Tire signal pressure-gage. G. F. Diamond and E. T. Richards, Kingston, N. Y.
 1,215,861. A composition of matter composed of cameta, caucho ball, and acra flake, for sealing pneumatic tubes. A. J. Rheubottom, New Albany, Ind.
 1,216,077. Automobile mat of rubber. E. A. Cohen and C. C. Colyer, Pittsburgh, Pa.
 1,216,240. Demountable rim. F. Lowe, Cambridge, Mass.
 1,216,244. Polishing roll comprising a body portion of rubber. A. McDowell; I. McDowell, administratrix of A. McDowell, deceased, assignor to V. H. McDowell—all of Lynn, Mass.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 30, 1916.]

- 12,957 (1915). Gutta percha and rubber in armor construction for ships' fenders, etc. E. Sherring, 6 Birch Lane, Longsight, Manchester.
 12,998 (1915). Pneumatic tire. J. Donkin, 58 Porchester Road, Bournemouth, Hampshire.
 13,041 (1915). Cushion tire with sponge rubber filler. J. Guerrero, 6 Square de Messine, Paris.
 102,025. Respiratory appliances. R. H. Davis, 187 Westminster Bridge Road, London.
 102,040. Artificial foot with two rubber buffers at the ankle joint. E. Ernst, 80 Charlotte street, Fitzroy Square, London.
 [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 10, 1917.]
 13,240 (1915). Overboot, New Liverpool Rubber Co., 292 Vauxhall Road, Liverpool, and J. W. Davies, 38 Whitham avenue, Great Crosby, Lancashire.
 13,257 (1915). Divers' dress. F. W. Walters, Manukau Road, Auckland, New Zealand.
 13,290 (1915). Tire inflating valves. M. S. Stevenson, 119 Victoria street, Westminster.
 13,371 (1915). Seat cushions containing inflated rubber balls for increasing the buoyancy of boats, rafts, etc. A. F. Emeric de St. Dalmas, "Tacotena" Lansdown Road, Sidcup, Kent.
 13,397 (1915). Device for supporting weak or damaged parts of tires. G. H. Broughton, 176 Montrose avenue, Toronto, Ontario, Canada.
 13,464 (1915). Tire comprising an inner tube, wood casing and rubber tread. C. H. Southall, 7 Vicker's avenue, Kirkstall, Leeds.
 13,470 (1915). Vulcanized india rubber ball. J. Liddle, 154 St. Vincent street, Glasgow.
 13,490 (1915). Massage and exercising apparatus. A. J. Bergonié, 6 bis Rue du Temple, Bordeaux, France.

Chemical Patents will be found on page 327. Machinery and Process Patents on pages 331-333.

- 13,543 (1915). Inflatable mattresses. G. Caselli, 129 St. George's Road, Southwark, London.
 102,075. Hot water bag of special shape. G. E. Skirres, 189 Regent street, London.
 102,088. Pencil sharpener and point protecting rubber eraser. W. St. A. F. Hubbard, 29 Burges Road, East Ham, London.
 102,108. Continuous inflatable life belt of rubber. H. B. Rogers, 6 College Gardens, Carleton Road, Tufnell Park, London.
 102,123. Life saving suit. S. D. Wills, Fort Payne, Alabama, U. S. A.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 17, 1917.]

- 13,722 (1915). Inflatable life belt. H. L. Roberts, 28 Alcina avenue, Toronto, Ontario, Canada.
 13,745 (1915). Inner tube. H. C. Boges, Dixie Cotton Chopper Co., Decatur, Alabama, U. S. A.
 13,758 (1915). Inflatable rubber back and shoulder pads for use when carrying packs. J. A. Pugh, 17 Richmond Crescent, Cardiff.
 13,764 (1915). Process of printing on china comprising a rubber-covered inking roller. R. S. Bennett, Kendor, May Bank, Stoke-on-Trent, Staffordshire.
 13,799 (1915). Rubber insulated conductor for ignition systems of internal-combustion engines. O. D. North, 76 Elm Park Mansions, Park Walk, Chelsea, London.
 13,905 (1915). Hard rubber covered metal non-skid studs for tires and footwear. W. T. Clifford-Earp, Marjoriebank, Barnes, London.
 102,170. Rope tread band for tires. B. P. Gray, Ellangowan, Bishop's Road, Sutton Coldfield, Warwickshire.
 102,193. Rebuilt tire. C. D. McGiehan, 2 Peasall avenue, Jersey City, New Jersey, U. S. A.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 24, 1917.]

- 14,007 (1915). Marine life-saving collar. W. G. Brokaw, Highpoint, North Carolina, U. S. A.
 14,072 (1915). Life-belts. W. H. Harding, Shottermill, Haslemere, Surrey; G. H. Leaver, 45 The Pantiles, Tunbridge Wells, Kent.
 14,115 (1915). Block tire. C. A. Simmons, 981 Broadway, Albany, New York, U. S. A.
 14,173 (1915). Detachable rim. J. H. Coffey and J. H. Coffey, 73 Jameson avenue, Toronto, Ontario, Canada.
 14,213 (1915). Rubber jointed dolls, models, etc. A. P. F. Ritchie, Queensbury place, London.
 14,229 (1915). Waterproof garment with special ventilation. C. F. Glenny, 152 Strand, London.
 14,233 (1915). Portable telephone set rendered waterproof by rubber solution. International Electric Co. and R. G. Le Noir, 111 Salisbury road, Kilburn, London.
 102,273. Flat rubber instep springs for gaiters. I. Rapaport, 50 Moor lane, London.
 102,289. Reservoir pens. R. F. George and W. H. Gordon, 300 Boston Block, Seattle, Washington, U. S. A.
 102,296. Rubber covered protective band for insertion between tire-tube and cover. P. Markoff, Antipiewski Pereulok House No. 10 qu. 19 Wolchonka, Moscow, Russia.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 31, 1917.]

- 14,279 (1915). Rubber hot water bottle. T. Rowe, 52 Harold road, Leytonstone, Essex.
 14,294 (1915). Life-saving vest. Montagu, Stern & Co. and S. Goldreich, Basildon House, Moorgate street, London.
 14,308 (1915). Rubber tip for spouts of teapots, etc. T. W. Bennett, Victoria Pottery, Liverpool Road, Burslem, Staffordshire.
 14,361 (1915). Pneumatic tires. W. H. Burritt, 4014 Lindell boulevard, St. Louis, Missouri, U. S. A.
 14,362 (1915). Sheet rubber for use in the manufacture of rubber threads. S. Carnap, von, 79 Balthasarstrasse, Cologne, Germany.
 14,382 (1915). Rubber buffers in electric signalling apparatus. M. A. Codd, 64 Belvedere road, Lambeth, London.
 14,398 (1915). Ventilating means particularly applicable to rubber boots. E. M. DeL. Carolin, 17 Moorville Grove, Beeston Hill, Leeds.
 14,433 (1915). Medical syringes. G. Raines, 34 Spencer street, London.
 102,347. Protective band for insertion between tire tube and cover. A. E. Sopher, 53 West Side, Clapham Common, and P. R. S. Vincent, 27 Creffield road, Ealing—both in London.
 102,379. Non-skid device for use with twin tires. J. A. Hill, Ordnance Works, Sheffield, assignee of V. Florio, 2 Via Catano, Palermo, Italy.
 102,429. Rebuilt tires. W. C. Taylor and F. Creassey, City Rubber Co., Upper Parliament street, Nottingham.
 102,422. Detachable rubber tread band. G. Ishihara, 738 St. Helen's avenue, Tacoma, Washington, U. S. A.
 102,446. Detachable rim. J. Stungo, 39 Cartvale road, Langside, Glasgow.

NEW ZEALAND.

- 38,000. Hot-water bottle or ice bag with means for compress or other attachment. T. W. Cotton, 150 Featherston street, Wellington, assignee of J. W. Appleton, New York City, U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 481,199 (March 16, 1916). Plain tires. Société Française des Roues Amovibles.
 481,217 (March 18, 1916). Improvements in process of re-covering old automobile tires. G. D. McGiehan.
 481,219 (March 18, 1916). Protection of pneumatic tires. P. Markoff.
 481,246 (March 21, 1916). Improvements in vulcanized rubber articles, and their process of manufacture. Goodyear's Metallic Rubber Shoe Co.
 481,306 (March 25, 1916). Improvements in elastic wheels. M. Chupka.
 481,293 (July 20, 1915). Process for the complete reclaiming of rubber from used automobile tires. H. Debaugé.
 481,335 (March 28, 1916). System and manufacture of pneumatic tires. A. H. Harris.
 481,346 (March 30, 1916). Process for the production of plastic matter, possessing the quality of celluloid, ebonite and and gutta percha. J. Ostromyslenski.
 481,350 (March 29, 1916). Pneumatic wheels. R. de Prandieres.
 481,374 (April 3, 1916). Cover for pneumatics. F. Lehmann.
 481,376 (April 3, 1916). Improvements applicable to rubber heels. F. Castelli and A. Guidi.

THE DOMINION OF CANADA.

ISSUED OCTOBER 31, 1916.

- 172,194. Rubber block wheel with pneumatic tire. C. A. James, Rose Park, South Australia, Australia.
 172,317. Tire remover. J. G. Faria, Grafton, Calif.
 172,337. Cushion tire. S. Johnstone, Corunna, Ontario.
 172,369. Tire tool. M. Waters, New Albany, Ind.
 172,396. Hose clamp. The Canadian Westinghouse Co., Limited, Hamilton, Ontario, assignee of C. A. McKerahan, Wilmerding, Pa.
 172,537. Life preserving jacket. S. Sarosiek, Nutley, N. J.
 172,568. An article made of vulcanized rubber having the structural characteristics of partially broken down rubber. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of C. D. Mason, Naugatuck, Conn.
 172,584. Lever for fountain pens. The L. E. Waterman Co., Limited, Montreal, Quebec, assignee of E. F. Britten, Jr., Jersey City, N. J.
 172,628. Tire protector. J. R. Cabanne, Seattle, Wash.
 172,644. Tire protector. W. H. Gahan, Victoria, B. C.
 172,668. Armored tire. W. F. Macklin, Appleton, Wis.
 172,670. Tire armor. W. McNames, Aberdeen, S. D.
 172,681. Anti-skid chain. T. B. Noden, Moline, Ill.
 172,684. Anti-skidding device. A. Purdie, Wyandotte, Mich.
 172,776. Fabric for tires. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of H. Z. Cobb, Winchester, Mass.
 172,917. Overlay for half-tone printing formed integrally of rubber. J. B. Neale, and F. W. Gage, assignee of a half interest—both of Battle Creek, Mich.
 172,918. Overlay for half-tone printing having a cushioning surface of rubber. J. B. Neale, and F. W. Gage, assignee of a half interest—both of Battle Creek, Mich.

DESIGNS.

THE UNITED STATES.

- 50,322. Bathing cap. Term 3½ years. Patented February 13, 1917. H. F. Samstag, New York City.
 50,323. Bathing cap. Term 3½ years. Patented February 13, 1917. H. F. Samstag, New York City.

DESIGNS FOR TIRES.

THE UNITED STATES.

- 50,265. Tire tread. Term 7 years. Patented February 6, 1917. A. L. Breitenstein, Akron, assignor to The Lancaster Tire & Rubber Co., Lancaster—both in Ohio.

50,265

50,269

50,282

- 50,269. Automobile tire. Term 14 years. Patented February 6, 1917. P. De Mattia and B. De Mattia, Clifton, N. J.
 50,282. Tire casing. Term 7 years. Patented February 6, 1917. G. W. Odell, South Bend, Ind.

TRADE-MARKS.

THE UNITED STATES.

- 95,422. The word **SILVAREIGN**—waterproof fabrics used in the manufacture of waterproofed garments. C. Kenyon & Co., Brooklyn, N. Y.
- 95,787. A design comprising the monogram M. A. M. Co., and the word **MARVEL**—tire vulcanizers and tire vulcanizing patches. The Marvel Accessories Manufacturing Co., Cleveland, Ohio.
- 98,122. An illustration of a horse shoe and on either side of it a wing—inner tubes for tires, tires, and tire casings composed in whole or in part of rubber or its equivalent or of rubber or its equivalent and fabric. Racine Auto Tire Co., Racine, Wis.
- 98,769. The word **AD-ON-A-TREAD**—double tread tire repair patches and repair boots. The Miller Rubber Co., Akron, Ohio.
- 99,199. The words **SIN PAR**—rubber and rubber-lined fabric hose. Peerless Rubber Manufacturing Co., New York City.
- 97,604. The word **VELVETREAD**—rubber and fabric casings or shoes for pneumatic tires. The Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio.
- 98,855. The words **MALTESE CROSS** and a representation of a Maltese cross—automobile and bicycle tires of rubber and fabric. Ajax Rubber Co., Inc., Millbrook, N. Y.
- 85,548. The word **ROADGRIP**—rubber vehicle tires. The Portage Rubber Co., Barberton, Ohio.
- 99,213. The words **WEE-NEE SQUAWKER**—toy balloons. The Miller Rubber Co., Akron, Ohio.
- 99,701. The words **THE TIRE RATE BOOK**—a periodical issued three times yearly. The Class Journal Co., New York City.
- 99,702. The words **TIRE RATE BOOK STANDARD TELEGRAPHIC CODE**—a section of a periodical which is issued three times yearly. The Class Journal Co., New York City.
- 100,104. The word **TUTEXKOTE**—overcoats. United States Rubber Co., New York City.
- 100,106. The word **BUSTERKOTE**—Same.
- 100,107. The word **KARTERKOTE**—Same.
- 100,111. The word **KASTERKOTE**—Same.
- 100,112. The word **KLEVERKOTE**—Same.
- 100,113. The word **KRAFTKOTE**—Same.
- 100,118. The word **KASTLEKOTE**—Same.
- 100,119. The word **KARLTONKOTE**—Same.
- 100,121. The word **KALDWELLKOTE**—Same.
- 100,122. The word **KIPPERKOTE**—Same.
- 100,127. The word **RIPPLEKOTE**—Same.
- 100,131. The word **KLUBBYKOTE**—Same.
- 100,134. The word **KARSLEYKOTE**—Same.
- 95,395. The words **SILVER KING**—golf balls. The India-Rubber Gutta Percha & Telegraph Works Co., Limited, London, England.
- 97,616. The word **PERMA-LOC**—non-adhesive patches for the inner tubes of automobile tires. E. A. Conroy, Wilkes-Barre, Pa., assignor to Permaloc Manufacturing Co.
- 97,834. The word **FLEXITE**—flexible rubber and composition disks for use as a universal joint member. F. R. Blair & Co., Inc., New York City.
- 98,711. A representation of an automobile wheel, with the word **EVERLOC** thereon—non-adhesive patches for repairing inner tubes and tire casings and other rubber goods. W. C. Wood, Minneapolis, Minn.
- 99,790. The word **GRYPHON**—rubber tires. Gryphon Rubber & Tire Corporation, New York City.
- 99,854. The word **MALCO**—rubber pneumatic automobile tires. P. S. Malickson, Philadelphia, Pa.

THE UNITED KINGDOM.

- 375,960. The word **NETTLE**—rubber insulated electric cables. Callenders Cable & Construction Co., Limited, Hamilton House, Victoria Embankment, London, E. C.
- 373,888. The words **REVOLITE DRI-SOLE**—soles and heels of artificial leather. The Revolite Co., Limited, Cambridge Street Rubber Mills, Cambridge street, Bradford Road, Manchester.
- 373,195. Representation of a rope slipknot rubber heels for boots and shoes. Plymouth Rubber Co., Canton, Mass.
- 376,073. Representation of a man—rubber goods. The North British Rubber Co., Limited, Castle Mills, Fountainbridge, Edinburgh, Scotland.

NEW ZEALAND

- 13,473. An illustration of a black cat rubber heels. Foster Rubber Co., Boston, Massachusetts, U. S. A.
- 13,523. The words **GOLD BOND**—inflatable rubber tubes for use with rubber tires. The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, U. S. A.
- 13,525. An illustration of a child dressed in sleeping garments, holding a tire in one hand, in the other a lighted candle, underneath is written the words **TIME TO RE-TIRE?** and **(BUY FISK)**—goods manufactured from rubber and gutta percha not included in other classes. The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, U. S. A.

THE DOMINION OF CANADA.

- 22,041. The word **WELDACUT**—a composition made either wholly or partly of rubber or in which rubber is a component part, such composition to be used for the sealing of small cuts in tires, tubes and other rubber goods. Gutta Percha & Rubber, Limited, Toronto, Ontario.
- 22,065. The word **PIONEER**—suspenders, garters, belts and armbands. Pioneer Suspender Co., Philadelphia, Pa.
- 22,072. The word **TIREOID**—composition for sealing punctures in pneumatic tires. The Tireoid Co., Chicago, Ill.

22,082. The word **TENAX**—substance composed wholly or partly of rubber or in which rubber or rubber substitutes are component parts, such substance to be used principally for soles and heels in connection with both leather and rubber footwear of all kinds, and as a substitute for leather soles and heels. Gutta Percha & Rubber Co., Limited, Toronto, Ontario.

A HOME-MADE BIAS CUTTER.

In the Goodyear Tire & Rubber Co.'s repair school at Akron, Ohio, cutting fabric on the bias is done with a wet knife instead of with shears. A straight edge like the one shown in the illustration, with blocks that have 45-degree edges nailed to either end, is used. These edges even up against the edge of the table and secure a perfect 45-degree cutting angle. The device is simple, but very effective. The hardwood strip which forms the straight edge for cutting can be made in a few minutes by any repairman.

McINTOSH UNIVERSAL MODE.

As the name indicates, this apparatus can perform various functions. It is designed to take the place of separate electrical equipment for the many tasks performed by motors in a physician's work, such as running an air compressor, driving a generator to produce galvanic current, generating a sinusoidal current, delivering cautery current, operating vibrators, etc. By turning the knob of a cleverly devised dial selector, the particular form of current desired is instantly placed in service.

The rubber-tired wheel shown in the illustration is keyed to the rotor shaft and by turning a crank at the end of the rotor shaft which controls a threaded rod engaging this wheel, its position against the friction cone adjusts the frequency of the sinusoidal and other slowly

pulsating waves. When the sinusoidal current is not desired, useless wear on these frictional contacts can be eliminated by means of an adjustable hub on the motor shaft which throws the friction gear out of service.

This all-in-one apparatus provides a simple, complete and durable outfit for the medical practitioner and it is claimed to be the most economical apparatus for the purposes it fulfills. [McIntosh Battery & Optical Co., Chicago, Illinois.]

B. H. V. Barnard, deputy Conservator of Forests, at Perak, Federated Malay States, has contributed a very comprehensive article on gutta percha in the November, 1916, number of the Agricultural Bulletin. Another article on coagulation of latex in the presence of sugars tells of the investigations of Doctors Gurter and Swart of the West Java Testing Station.

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK.

EARLY in February the unfavorable shipping situation that prevailed was followed by the announcement of Germany's submarine blockade, causing grave uncertainty in the crude rubber market. Spot stocks were undoubtedly low and the possible loss of rubber cargoes destined to America constituted a formidable threat. Consequently when the diplomatic break with Germany was reported, the market became very erratic and prices fluctuated violently. On February 5, First latex and Ribbed smoked sheet, spot, ranged from 86 to 88 cents, and April-June positions for both grades were quoted from 81 to 83 cents. Amber crépe, light, was 85 to 88 cents and Roll brown, spot, was 68 to 72 cents. Paras were also affected by the upward movement, Upriver fine, spot, being quoted 82-84 cents; Upriver coarse, 53 to 56 cents; Caucho ball, 54-55 cents and Cameta, 38 to 40 cents.

The market steadily advanced, supported by keen interest on the part of the manufacturers, who had evidently become apprehensive. The volume of dealers' business was noticeably large and general trading active. On February 15, First latex, spot, and Ribbed smoked sheet were 91½ cents, with April-June positions at 83½ cents. Paras were firm and in good demand, Upriver fine,

spot, being quoted 86 cents. Islands fine was very scarce.

As time passed with no overt act on the part of Germany, and rubber continued to arrive in considerable volume, the market became easier and prices gradually declined. On February 27 market conditions were very quiet and prices varied widely, First latex and Ribbed smoked sheets being quoted 84 to 86 cents and Upriver fine, 80 cents.

According to statistics compiled by the Rubber Association of America the United States imports for the year ending December 31, 1916, were 115,609 tons, divided as follows: Plantations, 85,531 tons; Paras, 22,060 tons; Africans, 3,591 tons; Centrals, 1,768 tons; Guayule, 1,140 tons; Manicoba and the other sorts, 1,519 tons.

LONDON.

Early in the month there was a noticeable tendency on the part of buyers to hold off, resulting in a generally quiet market tone. First latex and Ribbed smoked sheet, spot, were quoted 75 cents to buyers on February 5, with July-December positions at 72 cents. The anxiety on the part of American buyers to provide against submarine contingencies created an active market and prices advanced. On February 15 the First latex and Ribbed

Graphic chart showing world's rubber production; plantation, Brazilian and wild rubber production; amount of rubber retained by the United States and Great Britain; acreage of plantation rubber in bearing; average prices of plantation and Pará rubber; yield in pounds per acre and percentage of annual increase of plantation rubber acreage in bearing.

smoked sheet spot price to buyers was 80 cents. Trading continued briskly until the American apprehension had subsided, when easier conditions prevailed and prices declined. On February 26, First latex and Ribbed smoked sheet were quoted 77½ cents.

SINGAPORE.

For the period from December 29, 1916, to January 4, 1917, inclusive, the value of the highest grade of rubber is fixed at 74 cents per pound, and the 2½ per cent ad valorem duty on cultivated rubber will be assessed on a price of 68 cents per pound for all grades.

The average prices obtained at the auctions held February 12, 17 and 22, are as follows: First latex crêpe, 66.1 cents; Ribbed smoked sheet, 65.6 cents. The total amount sold was 1,356 tons.

BATAVIA.

The exports of plantation rubber from the Dutch East Indies for 1915 were 20,100 tons. For the first six months of 1916 the exports were 15,121 tons, forecasting a total of 30,000 tons for 1916.

COMPARATIVE NEW YORK PRICES FOR FEBRUARY.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"The demand for commercial paper during February has been fairly good on the whole, the best rubber names moving at 4½@5 per cent, and those not so well known 5½@6 per cent, but during the early part of the month when the flurry was in the money market there was but little demand."

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [December 29, 1916]: At the weekly auction held yesterday and today bidding was again stiff and all grades, except fine pale crêpe, suffered a decline averaging about \$4 per picul. At \$146 the top price for fine pale crêpe was \$4 up, but this figure was exceptional, the average being \$140 per picul. The highest paid for ribbed smoked sheet was \$137, being a drop of \$5 on the week. For unsmoked sheet there was no demand. The lower grades met with a better demand than last week at the lower level. The quantity sold was 393 tons, out of a total of 1,129 tons offered.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked...	\$130 @ 137	2/ 6¼ @ 2/ 8¼	55.25 @ 58.22

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore gives the export of plantation rubber from Straits Settlements ports for the month of December last as 3,219 tons, including transshipments amounting to 768 tons. The figures for November were 5,247 tons and for December, 1915, 3,005 tons. The total export for the past year was 48,650 tons, compared with 34,891 tons in 1915 and 19,727 tons in 1914. The following are the comparative figures:

	1914.	1915.	1916.
January	1,181	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,477	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
June	1,480	2,249	3,836
July	1,584	2,324	5,106
August	1,325	2,295	3,246
September	1,602	4,725	2,987
October	2,006	2,641	5,233
November	2,370	4,292	5,247
December	2,334	3,005	3,219
Totals	19,727	34,891	48,650

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

RUBBER STATISTICS FOR THE DOMINION OF CANADA.

IMPORTS OF CRUDE AND MANUFACTURED RUBBER.

	November, 1916.	
	Pounds.	Value.
UNMANUFACTURED—		
Rubber, and gutta-percha, in blocks, sheets, rolls, and rubber:		
From—		
Great Britain	727,344	\$401,230
United States	611,833	346,360
Totals	1,339,177	\$747,590
Rubber, recovered:		
From—		
United States	426,015	\$64,511
Hard rubber in sheets and rods:		
From—		
Great Britain	540	\$301
United States	1,185	1,058
Totals	1,725	\$1,359
Rubber substitute:		
From—		
United States	84,807	\$8,231
Rubber, powdered, and rubber or gutta-percha waste:		
From—		
Great Britain	2,340	\$122
United States	33,025	2,896
Other countries	730	47
Totals	36,095	\$3,065
Rubber thread, not covered:		
From—		
United States	5,218	\$7,457
Chicle, crude:		
From—		
United States	124,903	\$42,618
British Honduras	243,623	85,766
Mexico	91,739	30,973
Totals	460,265	\$159,357
MANUFACTURED—durable	General Tariff Value.	Preferential Tariff Value.
Boots and shoes:		
From—		
Great Britain	\$1,193	
United States	\$26,428	
Totals	\$26,428	\$1,193

	November, 1916.	
	General Tariff Value.	Preferential Tariff Value.
MANUFACTURED—		
Belting:		
From—		
United States	\$3,968	
Waterproof clothing:		
From—		
Great Britain		\$20,368
United States	\$11,511	
Other countries	148	
Totals	\$11,659	\$20,368
Hose, lined with rubber:		
From—		
United States	\$6,090	
Mats and matting:		
From—		
United States	\$454	
Packing:		
From—		
Great Britain		\$399
United States	\$6,739	
Totals	\$6,739	\$399
Tires of rubber for all vehicles:		
From—		
Great Britain	\$20	\$4,943
United States	56,325	
France	93	
Totals	\$56,438	\$4,943
Rubber cement and all other manufactures of india rubber and gutta-percha, N.O.P.:		
From—		
Great Britain	\$192	\$7,470
United States	66,149	
Other countries	416	
Totals	\$66,757	\$7,470
Hard rubber in tubes:		
From—		
United States	\$2,080	
Webbing—over one inch wide:		
From—		
Great Britain	\$37	\$929
United States	29,249	
Totals	\$29,286	\$929

EXPORTS OF DOMESTIC AND FOREIGN RUBBER GOODS.

	November, 1916.	
	Produce of Canada Value.	Reexports of Foreign Goods Value.
MANUFACTURED—		
Belting:		
To—		
United States	\$590	
Newfoundland	443	
Total	\$1,033	
Hose:		
To—		
Great Britain	\$2,223	
Newfoundland	1,655	
Other countries	7,235	
Total	\$11,113	
Boots and shoes:		
To—

THE MARKET FOR RUBBER SCRAP.

Copyright 1917.

NEW YORK.

UNDOUBTEDLY the difficulties surrounding domestic transportation are responsible for the quiet conditions that have characterized the February market. With embargoes placed on all shipments to and from New York and serious car shortage all over the country there was small chance for good business during the past month. Despite the handicap, however, there has been a quiet routine demand and prices are about the same as they were a month ago. Few changes may be noticed.

BOOTS AND SHOES. The trading in this material has been quiet and prices remain unchanged.

AUTO TIRES. Standard white G. & G. tires have received scant attention and prices have eased off considerably. Standard white tires have moved fairly well and show an advance of ½ to ¾ cent since our last report. The other grades are unchanged.

AUTO PEELINGS. Both No. 1 and No. 2 grades shows an advance of about ½ cent.

INNER TUBES. The tube position has been materially strength-

ened by the firm position of crude rubber and all grades are quoted from ½ cent to 1 cent higher than a month ago.

BICYCLE TIRES. The movement in this material has been moderate and prices have moved up ⅛ to ¼ cent.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917.

NEW YORK.

THE announcement of the German submarine blockade was instantly reflected in the market and prices declined. On February 1, spot cotton was quoted 14.75 cents as compared with 17.40 cents on January 29. As time passed with no overt act on the part of Germany the market gained strength and on February 27 middling spot cotton was quoted at 16.55.

EGYPTIAN COTTON. The scarcity of spot stocks and the small receipts during the past month has strengthened the market. Imports for the period December 27, 1916-January 17, 1917 were 9,000 bales as against 12,700 bales a year ago. Prices are firm, Sakellarides being quoted 50 to 55 cents on February 25. The price nominally is 30 cents.

Concerning the 1917 crop, The Alexandria Cotton Co., Limited, reports the following mail advices from Alexandria, dated January 19: "Thanks to the splendid weather we have had during the past week, the first ploughing for planting has been vigorously resumed over the whole country. However, it is too early to express any definite opinion as to the proportion of the varieties which will compose the next crop, but there is a general tendency to sow Sakellarides again over the whole of the Delta with the exception of the north, where the Assil and Nubari varieties seem to be more in favor owing to last year's failure of the Sakellarides variety in the poor lands of that district.

SEA ISLAND COTTON. The threatened abandonment of the Sea Island cotton industry due to the boll-weevil pest has been in a measure dispelled. Undoubtedly there will be a curtailment in the 1917 crop; that may result in a two-thirds crop reduction. In this event prices would doubtless reach abnormal levels. The normal crop is 100,000 bales.

The demand has been active and prices firm during the month. New York spot quotations have varied from 49 to 55 cents, depending on the quantity.

TIRE FABRICS. The demand has actively continued and contract deliveries have been insistently called for. This may be due to shipping delays, the result of car shortage and local embargoes; however, the uncertain position of the raw material would be sufficient reason for anticipatory buying. The level of prices may

be said to be higher than a month ago. Experiments in the substitution of Combed Peelers for Sea Island and Egyptian tire fabrics are being made as a relief measure should the long staple supply be curtailed.

MECHANICAL DUCK. The government has come into the market for supplies in large quantities, thereby strengthening the position of all mechanical duck. As a result prices on hose and belting duck are firmer and contracts are being written further ahead.

SHEETINGS, DRILLS AND OSNABURGS. The demand has been good as many buyers have anticipated their requirements. The market has been visibly strengthened by the prospective government business. However, prices have remained unchanged.

RAINCOAT CLOTH. The imported fabrics have apparently not been affected by the blockade as contract deliveries are being promptly made. The domestic mills are reported to be slow in making deliveries in view of the uncertain market conditions that appear to indicate higher prices.

*In addition to the exports shown above there has been a heavy movement direct from interior points to Southern mills and to Northern mills via Norfolk. It is impossible to say at present just how much cotton has been moved in this manner, but it is known to be somewhere between 15,000 and 20,000 bales. The latter figure is probably nearer the correct amount.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright 1917.

NEW YORK.

THE base metals that are used in the manufacture of rubber chemicals and compounding ingredients have occupied a strong market position during the past month, due wholly to transportation difficulties. On February 20 the copper metal had advanced 2 cents since February 1. Lead shows a gain of 1 cent, spelter has advanced .875 cents and the metal antimony has gained 5 cents during the same period. Aluminum has been dull and unchanged at 57 to 59 cents.

There has been a good general demand for all compounding materials during the past month and prices in some instances have advanced. The recent diplomatic crisis only resulted in tightening the ocean shipping situation. The freight embargoes that have been placed on all domestic shipments and the car shortage have more seriously affected the rubber chemical trade than has the political situation. Supplies from the west and middle west have been held up and contract deliveries from the eastern points greatly impeded. In view of the present adverse situation and the uncertain future it is advisable to anticipate forward requirements.

ANTIMONY SULPHURETS. The metal situation has stiffened

the market on this material, which has been in good demand.

ANILINE OIL. Prices have advanced about 5 cents since our report a month ago.

CARBON BLACK. The demand appears to be fully up to the supply. Prices are firm at figures ruling a month ago.

CHINA CLAY. The domestic material continues at high levels, being quoted at \$16 to \$25 the ton in carload lots. The nominal price is \$8 to \$10.

NAPHTHA. Solvent naphtha has advanced about 1 cent a gallon since our last report.

TALC. All imported grades are strong, due to foreign shipping difficulties. The domestic demand is good at unchanged prices.

VERMILION. English vermilion has advanced sharply owing to the embargo on English mercury. California supplies are handicapped by the car shortage and high freight rates.

WHITING. There seems to be no relief from foreign supplies of the raw material and the situation grows more acute. Domestic grinding is making good progress and deliveries from a southern mill were made during the month. The consuming trade is paying \$1.10 to \$1.15 a hundredweight for gilder's whiting.

ZINC OXIDE. The New York market has been quite firm, the XX brand going at 13 to 14 cents in second hands. Prices were easier in the middle west, due to local supplies. However, later in the month heavy demands were made on New York stocks, resulting in firmer prices on the American grades in second hands.

TABLE OF CONTENTS ON LAST PAGE OF READING.**AMERICA ON THE SEAS.**

ALTHOUGH crude rubber prices in the United States have risen somewhat, the submarine menace has as yet affected the supply scarcely at all. Nevertheless, the importance of a larger merchant marine grows daily in the minds of rubber, cotton and other importers and exporters of raw materials and manufactured goods. American commerce of every sort is carried on to a great extent in foreign bottoms, principally British, and as more and more ships have been requisitioned for war transport, and the toll of sinkings has increased, both importers and exporters have oftener experienced annoying delays and higher cargo rates because of the lack of adequate tonnage. Henceforth we shall have the full benefit of our armed merchantmen, but if, as now seems likely, the United States is destined to suffer greater losses through ruthless submarine activities the need of ships is likely to become more pronounced.

London and Berlin figures are widely at variance, but submarine warfare, measured by either, has thus far

fallen considerably short of its aim. Yet the campaign can hardly be said to be altogether a failure, although the list of submarines captured and destroyed is also believed to be a large and growing one. British embargoes and greatly restricted imports will minimize the effect of ship losses and conserve cargo space to the utmost, but, of course, British exigency will have first consideration in determining to what British cargo space shall be devoted.

The question whether America can have a merchant marine of its own worthy of the name is already answered. Bureau of Navigation statistics show that we can and do have one of more than 4,000,000 gross tons, exclusive of lake and river trade, that ranks second in the world's list, although only one-fourth England's tonnage at the outbreak of the war. Better still, last year was the third best in our shipbuilding annals. There were constructed in American shipyards 1,163 vessels of 520,847 gross tons to sail under the American flag, 886 vessels of 405,744 gross tons being for foreign trade. The figures for 1917 promise to be much more encouraging, for on February 1, American private yards were building, or under contract to build, 415 steel ships of 1,529,854 gross tons and 161 wooden vessels of 207,623 gross tons, most of them for ocean trade. Inadequate as is our new merchant marine, it provides the foundation upon which standardized construction and bulk production, as in the automobile industry, will build a great overseas carrier system of the future if properly safeguarded.

As a result of the war, high freight rates and scarcity of tonnage have rendered shipping under American registry very profitable, but this will not long continue with the coming of peace. The certain prompt replacement of British and European tonnage will in a few years reverse the situation unless preventive measures to promote our own reawakened shipping industry are taken in time. It is a national duty to protect the capital so courageously invested under only temporarily favorable circumstances in this potential American asset. Our shipping laws must be such that we can meet our own cargo requirements and compete successfully with other nations for a rightful share of the world's commerce.

RAILWAY SERVICE MUST BE MAINTAINED.

THE epochal decision of the United States Supreme Court upholding the constitutionality and enforceability of the Adamson law, establishing an 8-hour day in computing railway wage schedules, appears permanently to have eliminated the probability of future transportation paralysis such as twice threatened to imperil the nation during a gravely momentous period in its history and to bring American industry virtually to a standstill. The majority opinion is of far-reaching importance in declaring that both carriers and employees engaged in interstate commerce charged with public interest are sub-

ject to compulsory arbitration by Congress of differences affecting operation.

The agreement reached between the railway managers and the four brotherhoods to avert a nation-wide strike should by no means be overlooked, however. As a result of their public-spirited concession, previous to the court decision, the railway managers emerge with great credit from the controversy. It now remains for organized labor to make good its own recent pledge of patriotism, supporting the President in any measures he may deem it necessary to take as the international situation develops. Of course, in increasing operating expenses approximately \$50,000,000 a year in trainmen's wages, the railway managers have paved the way for a ruling by the Interstate Commerce Commission granting higher freight rates. The public will later hear of this through local storekeepers of every sort, but the public has an extraordinary liking for indirect taxation such as this in contrast with higher passenger rates which all can see.

THE EGYPTIAN COTTON EMBARGO.

THE embargo on shipments of Egyptian cotton from Alexandria and Liverpool, recently declared by the British Government, has the appearance of an unnecessary precaution. While the Indian cotton tariff is likely to be of direct benefit to Great Britain in the conduct of the war, this embargo is not of equally certain intent. Possibly she desires to place the importation of cotton by the United States under control similar to that of rubber, yet it is doubtful that much, if any, Egyptian cotton reaches British enemies through American re-exports. Shipments to the United States have shown a steady increase, it is true, but the manufacture of automobile tires has made a corresponding growth. A conservative estimate places the 1917 output at 25,000,000, and it is for tire fabrics that most of the imported Egyptian cotton is used.

A significant sidelight on the present situation is seen in the keen interest now being manifested by tire manufacturers in long-staple cotton planting, to the details of which an article on another page is devoted.

PENALIZING CARELESSNESS.

ACCIDENT compensation laws are highly commendable, and it is an indication of progress that 33 states have enacted such legislation with numerous amendments. Unfortunately, however, these acts are so widely at variance, both in safeguards required and damages prescribed, as to render it a considerable task for firms engaged in interstate business to keep tabs on all of them and avoid violating the laws of one state while abiding by those of another. Real need of uniformity exists, and with the coming of standardization several reforms should be inaugurated. A national bureau on uniform safety devices for each industry is needed, and

deformed persons should be insured a fair chance to secure employment.

The most important reform, however, lies in the direction of penalizing carelessness. Statistics show that year after year accidents due to carelessness of the injured greatly exceed those due to lack of safeguards, yet not one of the states having accident compensation laws takes this cause into consideration. Many accidents attributed to carelessness are in reality the result of employes misrepresenting their ability when being hired, and therefore being assigned to work for which they are unqualified. Obviously, the employe as well as the employer should shoulder his just portion of the liability. Uniform laws in justice to all will be admittedly difficult to frame, but the matter deserves earnest, impartial study and early action.

F. M. S. RUBBER EXPORT TAX.

THE disposition of American rubber manufacturers to extend their Far East plantations has led to protective measures on the part of British rubber interests. The initial step was taken by the Federated Malay States when a so-called "War Taxation Enactment," effective for one year from January 1, 1917, was passed, imposing export taxes on rubber and tin in addition to the regular customs duties. When the price of cultivated rubber does not exceed 2s. 6d. per pound, the tax is 2½ per cent ad valorem, otherwise 5 per cent. British property owners liable to pay an income tax on the profits from exported rubber are exempt from this export tax. Similar preferential enactments are likely to result elsewhere under British suzerainty. While obviously detrimental to American interests this is deemed an act of justice to the pioneers who risked their capital in building up the plantation industry of Malaya.

THE MOTORIZATION OF THE CIRCUS.

THE noble horse has made his last stand as a transportation necessity, and lost. For many years the motor vehicle has been usurping his place for pleasure driving, heavy hauling, light deliveries and fire service. In the world war, too, much of his former work is being done by motors. And last month came the announcement that even the circus manager is forsaking him, except for show purposes. The world's first motor truck circus, to be launched in May by the United States Circus Corporation, promises to revolutionize the outdoor amusement business, if not several lines of purely commercial transportation. The experiment will be watched in several quarters with the utmost interest because the severity of the test may bring about a distinct change in the type of solid tires for heavy trucks. At the outset both trucks and trailers will be equipped with large, single-tread solid tires designed to supply what the dual tread lacks in traction, even wear and extraordinary strength necessary to resist the strains of heavy service.

The Nature and Uses of Rubber Solvents—II.

By Lothar E. Weber, Ph. D.

[In the first instalment of this article Dr. Weber discussed gasoline, including casing-head and cracked gasoline, its characteristics, more desirable methods of designation, uses in dipped goods and cements, and solvent recovery.]

BENZOL.

NEXT to gasoline the most important solvent which finds commercial utilization in the rubber industry is benzol.

While there is a definite chemical compound of this name, the term benzol is used in a generic sense to denote certain liquid hydrocarbons which are found in coal-tar.

When bituminous coal is subjected to destructive distillation,* there is obtained (1) illuminating gas, (2) an aqueous liquid, the most important constituent of which is ammonia, (3) coal-tar, and (4) a residue of coke. The coal-tar is a viscous liquid of characteristic odor. It is intense black in color, due to the presence of suspended particles of carbon. This is the same coal-tar which, as the basis of many dyestuffs and medicinal preparations, has been so widely discussed during recent years. It is a highly complex mixture, containing as it does, substances of widely different characteristics and properties. Amongst them is benzol, which is present to the extent of only about 1.5 per cent.

By subjecting the coal-tar to distillation, the benzol is separated from the remaining substances. As has already been stated, the term benzol is used to designate a group of generic hydrocarbons, which latter bear very much the same relationship to each other that the paraffin hydrocarbons do. Fortunately the gravity nomenclature is not used in designating these hydrocarbons, they being referred to technically on a boiling point basis. By "Benzol Pure" one infers a solvent consisting essentially of the chemical substance known as benzol. This material has a constant boiling point of 80.4 degrees C. (177 degrees F.) Under "100 per cent Benzol" one designates the material which is 100 per cent distillable at 100 degrees C. The material which is 90 per cent distillable at 100 degrees C. is referred to as "90 per cent Benzol." This nomenclature is a logical and desirable one, in that it enables a purchaser at a glance to know the comparative boiling points, and hence the volatility of the solvent.

In the United States it is the 90 per cent benzol which probably finds the largest application in rubber manufacture. This product consists of about 70 per cent pure benzol, the residue being for the most part toluol. The 90 per cent benzol is seldom used for spreading purposes, but it finds considerable application in the manufacture of cements and dipped goods, and to a certain extent in the cold cure.

Benzol—meaning thereby 90 per cent benzol—is much to be desired over gasoline as a rubber solvent. It is in the first place a more uniform product, has a much narrower range of boiling points, and largely increased solvent power. Whereas a gasoline solution is always opaque in appearance, a benzol solution of rubber is clear and transparent. There is no indication of any suspended matter being in the rubber solution, which is always the case when gasoline is used as a solvent. Probably on account of this homogeneity the film resulting from a benzol solution of rubber is stronger in its physical properties, and at the same time more transparent in appearance, than is the film produced from a gasoline solution. The range of boiling points being narrower, there is less chance for the formation of blisters in the case of dipped goods and blowing in the case of cement when benzol is the solvent employed. Under present conditions the price of benzol is more than double that of gasoline, but after cessation of hostilities the discrepancy in their prices will

probably be slight, owing to the vastly increased benzol production in this country. When such is the case, it will be very much to the advantage of the rubber manufacturer to substitute the utilization of benzol for gasoline in dipped goods and cements.

SOLVENT NAPHTHA.

This material is also obtained from coal-tar and has no relation whatsoever to any petroleum product. Its boiling points range from about 140 degrees C. to 170 degrees C. It consists essentially of two hydrocarbons known as xylene and cumene.

Solvent naphtha has never found wide application on the part of the rubber manufacturer in the United States, though it is used very extensively in Europe. Gasoline is used to a moderate degree by the European rubber manufacturer, and scarcely ever in the spreading operation, except in limited admixture with solvent naphtha. The claim is authoritatively made that gasoline itself cannot be used with any degree of safety in England for the spreading operation, the peculiar atmospheric conditions which obtain creating an excessively precarious fire risk. It is, indeed, a fact that in the days prior to the development of the internal combustion engine when gasoline was a drug on the market, European manufacturers used solvent naphtha almost exclusively as the spreading solvent, and this in spite of the fact that the latter, as produced abroad at that time, had serious objections in that it imparted an odor to the spread compound. The odor is due to the very disagreeably smelling substance known as pyridine, which even when present in the solvent to the extent of less than 0.1 per cent, makes itself exceedingly offensive. The solvent naphtha produced in America is almost invariably free from even these minute traces of pyridine, as also is the European product as usually marketed within recent years.

SHALE OIL.

In Scotland, and to a certain extent in Germany, the destructive distillation of certain bituminous shales is carried on quite extensively. Shale is a rock formation, usually of a brownish or gray color, which is permeated with bitumen. The shale is heated in retorts, whereby the bitumen suffers destructive distillation. From the tar resulting on distillation there is obtained shale naphtha, which has physical properties analogous to the solvent naphtha obtained from coal-tar. While shale naphtha has found very little application in America, it is used quite extensively in Europe for purposes where the odor does not militate against its use.

CARBON BISULPHIDE.

This solvent is made by the interaction of carbon and sulphur. The older method of passing sulphur vapor over coke or charcoal, heated to a red heat, has been practically superseded by the electrical method, whereby the two components are heated in an electric furnace. Carbon bisulphide, when strictly pure, has a sweetish, pungent odor, although the article of commerce is more or less evil smelling, owing to the presence of certain sulphur impurities. Carbon bisulphide boils at 46 degrees C., and even at ordinary temperatures is extremely volatile. Great care has to be exercised in the handling of it, for the reason that its vapors are inflammable when heated only to the relatively low temperature of 150 degrees C. When carbon bisulphide burns, there is produced sulphur dioxide and carbon dioxide, both extremely suffocating and irritating gases.

*By destructive distillation is meant the heating of a substance, in the absence of air, to a temperature at which decomposition results.

Carbon bisulphide finds practically only one application in the rubber industry and that is as a diluent for sulphur chloride in vulcanization. Owing to the disagreeable properties of carbon bisulphide just enumerated, many attempts have been made to find a substitute for it. While combinations of solvents have been obtained which give passable results, it is, indeed, a fact that nothing has been found which can replace carbon bisulphide with complete satisfaction.

The sulphur chloride cure is essentially a surface vulcanization, both in the case of the vapor cure and the wet cure. It is the surface of the rubber article which is primarily subjected to the action of the sulphur chloride. To be sure, the rubber below the surface is also acted upon, but, broadly speaking, except in the thinnest of articles, the sulphur chloride cure is not a thoroughly uniform one in the direction of the thickness of the article. Obviously the greater the penetration of the sulphur chloride and the quicker this penetration, the more uniformly will the rubber be cured. It is an observed fact that carbon bisulphide has the property of penetrating crude rubber to a remarkable degree. In fact, it stands preëminent among the commonly employed solvents in this respect, and it is on

account of its property of penetration that carbon bisulphide gives such satisfactory results in the sulphur chloride cure.

CARBON TETRACHLORIDE.

Carbon tetrachloride is made by the action of chlorine on carbon bisulphide, sulphur chloride (the curing agent) being produced simultaneously. Carbon tetrachloride is a heavy liquid of sweetish odor, boiling at 78 degrees C., and is not in the least inflammable. In fact, its vapors form a protective curtain around any burning article upon which the liquid is cast, a property of carbon tetrachloride which finds extensive application in the utilization of this substance as a fire extinguisher. Carbon tetrachloride is employed to a certain extent as a substitute for carbon bisulphide in the cold cure. Owing to its non-inflammability, and more agreeable odor, it has an advantage over carbon bisulphide, but from the standpoint of vulcanization, carbon bisulphide is the more preferable diluent. Somewhat more satisfactory results are obtained by using a mixture of carbon tetrachloride and benzol. This mixture is the closest approach in its properties to carbon bisulphide that has yet been found, but as a diluent for sulphur chloride could scarcely be said to be the full equal of it.

Egyptian Cotton in Arizona by Irrigation.

COTTON came into its own again in 1916 as a result of the war demand and Federal financial aid, yet the increased production of long-staple varieties was relatively small. Yarn spinners and fabric manufacturers have for several years past deplored the limited and uncertain supplies of American long-staple cotton, and last season was no exception. It now remains to be seen how long it will be before they take matters into their own hands and remedy the situation.

NEW UPLAND VARIETIES.

The production of long-staple cotton constitutes one of the great undeveloped agricultural resources of the United States and one that is capable of enormous expansion. For several years the industry declined because the boll weevil invaded the former long-staple districts of the lower Mississippi valley, but the introduction of early-maturing long-staple varieties by the United States Department of Agriculture and the tested fact that cotton can be grown by irrigation in undeveloped localities of the Southwest have injected new factors of far-reaching importance.

Such varieties as Columbia, Foster, Express and Durango, the latter grown extensively in Imperial Valley, California, can, by observation of the necessary precautions, be grown over a large part of the cotton belt, and are less subject to insect ravages than the older late-maturing varieties. Under improved cultural methods, with the aid of uniform conditions assured by irrigation, and by adoption of early-maturing varieties long-staple can now be grown more cheaply than in former years. While long-staple cotton for a period of several years past has averaged 60 per cent higher in price than corresponding grades of short staples, it can now be grown profitably at an average premium of 30 per cent. Undoubtedly the resulting tendency will be toward the substitution of higher-grade cotton in many classes of manufactured goods for which short staples, although now used, are but poorly adapted.

The earliness of these new varieties is represented not so much by the date when the bolls begin to open as by the setting of the crop in a shorter period of time after flowering begins. Contrary to the belief of many conservative planters, these varieties are nearly if not quite as productive as short-staple varieties with similar habits of growth; indeed, have outyielded them in many experiments. These advantages, coupled with the greater in-

trinsic value of the product, are tremendous arguments in favor of its culture, and with the steadily increasing demand for long staples the discouragingly wide price fluctuations of the past from season to season will surely be lessened, so that the long-staple planter need not fear finding himself at a disadvantage with growers of short staples.

PRECAUTIONS IN GROWING LONG STAPLES.

This is as it should be, for long-staple cotton growing requires not only more favorable natural conditions, but greater skill and care on the part of the producer, who is justly entitled to a greater reward. Successful long-staple cotton culture cannot be maintained by ordinary cotton-farming methods. Particular attention must constantly be given to maintaining stocks of pure seed by continued selection, avoidance of crossing varieties in the field, and admixture of seed at public gins, else the crop in two or three years will surely decline in quality as well as in quantity. Obviously degeneration will manifest itself more quickly than in short staples, because the requirements of uniform quality are higher.

COMMUNITY PRODUCTION ESSENTIAL.

Thus it becomes apparent that scattered individual efforts are precarious, and that success lies in community production of a single superior variety. Indeed, community organization is as essential to the maintenance of quality as to the marketing of the crop, and manufacturing interests entering the planting field do well to coöperate with such organized communities where a single long-staple variety is grown rather than to risk failure elsewhere. Egyptian cotton is therefore indicated in Salt River Valley, Arizona, and Durango, a long-staple Upland variety, in Imperial Valley, California.

EGYPTIAN COTTON IN SALT RIVER VALLEY.

It was to compete with Sakellarides, imported in great quantities, that experiments were begun in Egyptian cotton culture in Arizona in 1902. Ten years later the industry was inaugurated commercially, and proved successful. While it has not assumed large proportions, it promises to do so during the next few years because of virtually ideal conditions. Last year about 7,000 acres were under cotton and a well-balanced agriculture in Salt River Valley would permit 20 per cent of the total project, or 50,000 acres, producing as many bales annually. Similar con-

ditions exist in the Yuma Reclamation Project on the lower Colorado River, which includes a total of 100,000 acres, or 20,000 available for cotton. For the assistance of farmers a well-equipped experiment farm is maintained in each irrigated district by the Department of Agriculture.

In Egypt, cotton is grown entirely on irrigated land and in a climate practically rainless throughout the period of development of the cotton plant. This absence of rain, especially during the picking season, favors the production of clean cotton. Conditions in Salt River Valley, therefore, are substantially the same, except for the advantages of freedom from the boll weevil, pink boll worm and most other insect pests, and but slight occurrence of Hindi, or "weed" cotton contamination which renders difficult the maintenance of pure seed. Probably the higher valuation of land and cost of irrigation water in Egypt, together with less efficient hand methods of tillage, nearly if not quite offsets the higher cost of labor in America, which is felt chiefly in picking. As the crop-producing capabilities of the land in the two regions are much the same, and in staple and quality of fiber the commercial value of the Arizona crop compares favorably with the best of the Egyptian varieties, such as Jannovitch and Sakellarides, the difference to the American manufacturer lies chiefly in the freights, that by rail to New England from Arizona being normally about three times as much as from Egypt to America by water. There are several methods of surmounting this handicap, but a consideration of them is beyond the scope of the present article. Suffice it to say that comparatively little difficulty has been experienced thus far in disposing of the crop at satisfactory prices, due no doubt to the realization on the part of progressive manufacturers that new American sources of long-staple cotton should be developed and encouraged while in an experimental stage.

YUMA COTTON.

Two varieties of uniformly high quality long-staple cotton known as Yuma and Pima are available for Arizona planting. Both were bred up by the Bureau of Plant Industry of the Department of Agriculture by selection from the Mit Afifi variety of Egypt, and are of a sort not available anywhere in Egypt. As segregated in 1908, the Yuma variety is distinct in the character of the plant and of the fiber. The lint ranges from 1 7/16 to 1 9/16 inches in length, according to soil and cultural conditions, and has the pale, pinkish buff color of Jannovitch cotton rather than the deeper buff color of the original Mit Afifi. The lint averages about 28 per cent. Yield and spinning tests during the past eight years have demonstrated that a stable variety, uniform in character and of good spinning quality, has been developed.

PIMA COTTON.

In 1910 another distinct type was segregated from the Yuma and given the name of Pima. This superlatively excellent new strain surpasses the parent variety in productiveness, size of the bolls, length and quality of the fiber, greater freedom from limbs, and general uniformity. The Pima fiber staples from 1 5/8 to 1 3/4

inches and is finer and lighter colored than Yuma. The upward vegetative branches are fewer and shorter, the fruiting branches, especially the lower ones, longer and better furnished with bolls. Because of these facts more light reaches the lower part of the plant, the crop matures earlier, the early bottom crop is heavier, and picking is easier. In lint percentage it differs but slightly from Yuma, the tendency being in favor of the latter. Spinning tests encouraged the substitution of this variety for Yuma, and during the season of 1916 it was grown for the first time commercially in the Salt River Valley. Seed enough to plant about 5,000 acres of this variety was produced, and by the spring of 1918 there will be seed enough to plant 100,000 acres or more.

SEED SUPPLY.

A Yuma seed supply of uniform quality is maintained by the Salt River Valley Egyptian Cotton Growers' Association under the supervision of Department of Agriculture experts. This cotton is grown in isolated places to prevent crossing, and under as nearly ideal conditions as possible. Early in July, soon after blossoming begins, every plant is examined and those of inferior quality are rogued to prevent contamination of others with their pollen. Thus the seed for general planting this year was derived from the fields rogued in 1915, and can probably be sold at only a slight advance above current oil mill prices. It is sufficient for 100,000 acres or more.

COTTON IN ROTATION WITH ALFALFA.

To be profitable, Egyptian cotton farming must be not a single crop culture, but part of a system of crop rotation in which alfalfa, for instance, is alternated occasionally with cotton. In past years, profit in alfalfa has depended upon growing livestock to consume it and involved heavy overhead expenses which cotton spinning and weaving companies have hesitated to assume. But the livestock industry of Salt

AN ARIZONA IRRIGATION CANAL.

River Valley is assuming such proportions as to provide a ready market near at hand. Indeed, alfalfa occupies over half the irrigated land and is the basis of agricultural operations in that locality.

Cotton and alfalfa culture greatly benefit each other. Alfalfa brings a good cash return, puts humus into the soil and provides an ideal enrichment for subsequent cotton growing, while cotton renovates the soil of weeds. As a result of continued planting, alfalfa fields become badly infested with Bermuda and Johnson grass. One or two well-tilled crops of cotton, however, will leave the land in excellent condition again for alfalfa or for any crop, as the cultivation between the plants when young and the complete shading of the ground later in the summer kills weeds of every sort. Little, if any, more than half as much irrigation water per season is required for cotton as alfalfa, so that expansion of cotton culture in Salt River Valley may ultimately lead to extension of the irrigated area.

COST OF PRODUCTION.

Estimates of the cost of production have been prepared for the Department of Agriculture by W. S. Dorman, who has had over four years' growing experience in Salt River Valley, and

as president of one of the growers' associations has had access to all the facts. His figures, including interest on the land investment and deducting the value of seed produced, are as follows:

	Cost per acre of	
	Two-thirds	One bale
Plowing, preparing soil, cultivating, and seed.	\$15.00	\$15.00
Irrigation water	1.50	1.50
Picking seed cotton	24.00	30.00
Transportation to gin	2.50	3.00
Ginning lint, at 2 cents per pound	6.72	10.00
Interest on \$150 at 8 per cent.	12.00	12.00
Total cost	\$61.72	\$77.50
Value of cottonseed at 75 cents per 100 pounds	6.15	9.26
Net cost of lint	\$55.57	\$68.24

This shows the net cost of production per pound of lint as 16.66 cents when the yield is two-thirds of a bale per acre, and 13.65 cents when the yield is one bale per acre. On a 40-acre tract which yielded nearly a bale and a half to the acre in 1914, the cost was reduced to 12.37 cents. The detailed table which follows indicates the importance of securing large yields per acre if the industry is to be made profitable.

Item of cost.	Cost per acre.
Seed and tillage	\$15.10
Irrigation water	2.00
Picking 2,552 pounds of seed cotton, at 2 cents	51.04
Ginning, insurance, yardage, and association of ex-	15.48
Interest and taxes	17.25
Total	\$101.37
Receipts for cottonseed	10.32
Net cost per acre	\$91.05
Value of cottonseed at 75 cents per 100 pounds; net cost of lint per pound	12.37

TILLAGE METHODS.

The best methods of preparing the land for Egyptian cotton and of irrigating and cultivating the crop have been described in detail by E. W. Hudson, of the Bureau of Plant Industry, in Farmer's Bulletin 577, for free distribution by the United States Department of Agriculture. Briefly, they consist in early and thorough preparation of the land; careful leveling, so that the entire field can be irrigated uniformly and with less water; early planting; getting the seed into moist soil; late thinning; leaving the plants close together in the row; the sparing use of irrigation water until the plants blossom; thorough cultivation as long as the size of the plants permits; and frequent light irrigation after blossoming begins until the crop is fully matured.

As Egyptian cotton requires a growing season of about nine months, or several weeks longer than Upland, and as cotton ripened in October and November is always superior to that ripened later, planting should occur as early in March as possible after the danger of frost is over.

PREPARATION OF THE LAND.

This implies early preparation of the land, which should be begun in the previous autumn and continued through the winter. Although some raw desert land will grow good cotton, land previously in alfalfa will produce better cotton more economically and with less irrigation, as the soil holds the water better and requires no separate irrigation of lighter spots. Such land

should be plowed 2 inches deep in October or November, turned up to the sun until thoroughly dry, and then plowed again in January 4 to 6 inches deep. Land to be planted a second time in cotton should be gone over with a stalk cutter and then plowed, disked and harrowed thoroughly. Preparation of new land infested with Bermuda and Johnson grass should be begun as early as August, followed in October or November, and again in January or February by deeper plowing, diskings, harrowing and cultivating to bring as many roots as possible to the surface. These should be raked up and burned. It may cost \$6 to \$10 an acre to clear new land.

PREPARATION OF THE SEED BED.

Land previously in cotton or grain, if irrigated before plowing, can be put in condition by one plowing. Land previously in alfalfa should be plowed twice. Late in February borders should be thrown up about 2 rods apart, and just before planting the land should be flooded and then disked and harrowed.

PLANTING

Use a two-horse planter while the ground is still moist enough to insure seed germination and plant in rows 3 feet apart on new land or 4 feet apart on alfalfa land. Plant to an average depth of 1½ inches with 40 to 50 pounds of seed per acre.

EARLY CULTIVATION.

Begin cultivation as soon as the plants are visible, in order to break any crusts that may have formed, to check evaporation, and to kill the weeds.

EARLY IRRIGATION.

New land may require water sooner, and three or four times before July 1, but alfalfa land after 6 to 8 weeks will require light furrow irrigation followed by cultivation as soon as the ground is dry enough to work, and again in 10 to 14 days. Repetition of this treatment after three or four weeks will be all the water required before July 1. Cultivation should follow any rains that occur.

THINNING.

After the second irrigation, when the plants are 8 to 10 inches high and have 10 to 12 normal leaves, they should be thinned to 4 to 6 inches apart in the row on new land and 6 to 16 inches on alfalfa land, depending on the richness of the soil. The idea is to obtain a uniform stand and consequent larger total yield. Thinning in two operations has the advantage of insuring enough plants to replace any that may be killed during later cultivation, and the comparative closeness of the plants until the final thinning favors the fruiting branches at the expense of the larger unproductive vegetable branches. Thinning can usually be contracted out at \$1 per acre.

LATE CULTIVATION.

Cultivation should continue every 10 or 15 days, as long as a horse can be driven between the rows without damage to the plants. After the plants have 8 to 10 leaves this should be so done as gradually to draw earth toward them until the plants are on a ridge 3 to 4 inches high and 12 to 14 inches wide. This insures more even distribution of water during the late irrigations and conserves moisture around the plants. After cessation of horse cultivation, the middle of the rows may be gone over once or twice with a single-row 7-shovel or spike-tooth cultivator.

LATE IRRIGATION.

From July 1 until after October 1, most soils require irrigating, not exceeding a 6-hour run, every 10 or 15 days to prevent wilting of the flowering plants during the middle of the day. The water should be drained off in each instance and not allowed to stand in the lower part of the field to damage both crop and land. At least two irrigations should be given after the first picking.

PICKING.

At least three pickings are necessary, and these should begin between September 15 and October 1, but not until 600 to 1,000 pounds of seed cotton per acre can be obtained. This is desirable in order to bring the second picking rather late in the season. Each picking, and any frosted cotton, should be kept separate in ginning and baling, as there is often a marked difference in grade. Picking Egyptian cotton requires greater care and is more expensive than picking Upland cotton because of the smaller size of the bolls and the necessity to keep the seed cotton clean so that the quality of the lint will not be impaired nor its selling value reduced. Then, too, no dependable cleaning device has been found which can be attached to the roller gin. Hand labor is neither abundant nor cheap in the Southwest, but Salt River Valley is better provided for than some other sections, because of the Pima and Papago Indians, two capable, industrious tribes which are taking up this work with satisfaction to themselves and their white employers. A force of 5,000 to 7,000 is available. Two cents per pound is the price paid, and pickers vary from 100 to 200 pounds a day according to aptitude and experience.

GINNING.

Four ginning establishments, each equipped with 10 roller gins, and devoted exclusively to ginning Egyptian cotton, are located at Phoenix, Tempe, Mesa and Chandler, while the cottonseed products are taken care of by two oil mills in Phoenix. The cost of ginning is usually somewhat less than \$10 a bale, although more than twice that of Upland cotton in the South. This is due to the fact that the roller gin used for the Egyptian cotton cannot be operated as rapidly as the customary saw gin, but improvements in the mechanism promise a considerable measure of relief in this particular stage of handling.

[In the preparation of the foregoing article we are indebted to Farmer's Bulletins and miscellaneous other circulars and papers prepared for the Department of Agriculture by C. S. Scofield, T. H. Kearney, C. J. Brand, O. F. Cook and W. T. Swingle, constituting the Committee on Southwestern Cotton Culture.]

H. Muehlstein & Co., scrap rubber dealers, New York City, celebrating their recent removal to new quarters, are sending out a neat souvenir in the form of a pocketbook which, while small enough to fit in the ordinary vest pocket, has a quite generous capacity. A bill fold with protective flap occupies the entire length of the three folds. The inside has a celluloid-covered card for filling out identification information of the owner, a section devoted to loose leaves for memoranda, with accompanying pencil, a small pocket containing a book for postage stamps and an enclosure for a year's monthly calendars. On the outside are four separate and distinct pockets for cards, tickets, memoranda, etc., one of these having a flap with ball and socket fastener. The advertisement of the firm is stamped in gold, thus forming a permanent reminder of the giver.

SEA ISLAND COTTON.

FARMER'S BULLETIN 787, by W. A. Orton, pathologist in charge of cotton and truck disease investigations of the Bureau of Plant Industry, United States Department of Agriculture, provides a comprehensive manual for the cotton planter, covering geographical distribution of Sea Island cotton in the United States; ideal crop requirements; possible extension of the Sea Island cotton producing area; markets; factors governing prices; defects in economic conditions; cultivation; fertilizers; preparation of the land; seed selection; handling the crop; diseases.

As to the possible extension of the Sea Island cotton-producing area the author writes:

There is little encouragement to offer to those who would attempt to introduce the culture of Sea Island cotton into other parts of the country than where it is now grown (South Carolina, Georgia, Florida). Many such trials have been made during the past hundred years, and all have failed. Even in the present area the crop is losing rather than gaining ground in competition with Upland cotton, although the production of Sea Island cotton might be increased if market conditions warranted.

In addition to the effect of high prices in stimulating the industry and of low prices in depressing it, a factor which must be considered in connection with the production of

cotton in either old or new sections is the supply of available labor. Until present methods are revolutionized a relatively large amount of fairly cheap labor is required, and it is a great advantage if the laborers have had long experience with the crop. Throughout the Sea Island cotton belt there is now a growing scarcity of labor, which is likely to restrict the acreage planted. The farmers must meet the new conditions by the adoption of labor-saving machinery in planting and in cultivation, but there will continue to be difficulty in getting the cotton picked.

EGYPTIAN COTTON GROWN IN SALT RIVER VALLEY.

The development of trucking and lumbering industries restricts the less profitable cotton crop, and there is a steady exodus of laborers to engage in railroad building, etc., making the labor problem still more serious.

Serious obstacles are met with in introducing Sea Island cotton into a new section. There is difficulty in securing the proper care in cultivation and in picking and handling the staple. Pickers accustomed to Upland varieties object so much to the small and partly closed Sea Island bolls that it is difficult to get the cotton picked even at the prices now paid—\$1 to \$1.25 a hundred pounds. The ginning must be done on a roller gin, as the saw gin injures the staple too much, and a specially equipped ginnery is therefore necessary. Further difficulties are met with in marketing the product, which at first can rarely be sold to advantage in a local market where the buyers are unaccustomed to the Sea Island staple. Shipment to a recognized market for Sea Island cotton is necessary in such cases. (Charleston, South Carolina; Savannah, Blackshear, and Valdosta, Georgia; Alachua and Madison, Florida).

In a recent campaign in Montreal, Canada, for the Patriotic and Red Cross funds, in charge of the One Day's Pay Committee, the total amount collected was over \$4,000,000, and of this \$12,089 was contributed by employees of the Canadian Consolidated Rubber Co., Limited.

The Manufacture of Jar Rings.

THE production of jar rings has assumed such proportions as to make it a most important branch of the rubber industry. The compounded stock from which the rings are made is generally run through a tubing machine, the outside diameter of the resultant tube being slightly larger than is required to offset the reduction in size when the tube is wrapped for curing. As the stock is run from the tubing machine it is cut off in lengths of about 30 inches. These are placed on steel mandrels and wrapped tightly with strips of wet cloth, after which the tubes are vulcanized in open steam for 30 minutes at 50 pounds pressure.

After curing, the tubes are removed from the mandrels by compressed air and at the same time each tube is forced by the same means over a special mandrel upon which the rings are cut. This mandrel, upon which the tube is mounted, is revolved in the lathe at a high rate of speed and the cutting is done by sharp steel blades mounted on a traveling carriage provided with a longitudinal feeding mechanism, the cutting blades being pressed against the revolving tube by a cam or other mechanism. The cut rings are stripped from the mandrel by compressed air and then inspected, counted and packed.

An important item in the successful cutting of jar rings is the cover for the cutting mandrels. This is usually made of brass that will not injure the cutter when it passes through the

vision is made for stopping the feed shaft to prevent over-feeding of the cutter carriage, and for shutting off the power when the carriage has reached the end of its forward travel.

COFFEY'S LATHE.

In Fig. 2 are shown the front and end elevations of this

FIG. 2.—COFFEY'S LATHE.

machine. *A* is the lathe bed and *B* the cam shaft that moves the knife carriage to and from the work. Mounted on the bed *A* is the carriage *F*, which is moved longitudinally by a lead screw *G* driven from the spindle by change gears *H*. The rotary knife *I* is mounted on a short belt-driven shaft, that is journaled in the cross slide *L*, which is attached to the auxiliary slide *I* and the carriage *F*.

After the knife has been set in proper relation to the surface of the rubber tube to be cut, and the lathe started, one half a revolution of the cam will feed the knife to the required depth, while during the other half revolution the knife is withdrawn by the cam. The moment the knife has cleared the surface

FIG. 3.—PIANAROSA'S ORIGINAL LATHE.

FIG. 1.—McGEOUCH LATHE.

rubber. This covering was formerly a cheap grade of rubber compound, rolled on the mandrel by hand and cured in the usual manner, after which it was dressed down to size on a speed lathe. Such a covering, however, becomes so badly cut after a short time as to be rendered useless. A substitute for this covering is one of tough stock, sheeted very thin on a calender and built up to the exact diameter on the mandrel. The uncured stock will stand more cutting than when cured, and when worn out it may be stripped from the mandrel, sent to the mill room and sheeted for further use. Paper tubes are also used.

There are several types of jar ring lathes and the principle is about the same in all. However, the more recent machines show marked improvement in design and construction that makes for greater production. Descriptions of the most important machines follow:

THE McGEOUCH LATHE.

The machine shown in Fig. 1 is designed for cutting two rings simultaneously. *A* represents the mandrel upon which is placed the rubber tube *B*, and *C* and *D* are circular knives mounted on shafts which are journaled in the swinging arms *E* and *F*. The knives are moved into engagement with the tube *B* by a cam on the shaft *G*. After the two rings are cut, the cutters are held in operative position while the knife carriage is moved longitudinally a distance equal to the thickness of the rings. Pro-

of the rubber, the carriage is moved longitudinally the required distance to bring the knife in position for the next cut.

THE ORIGINAL PIANAROSA JAR RING LATHE.

The jar ring cutting lathe, shown in Fig. 3, differs in design from the usual type. The feature of this lathe is an elliptical rotary cutter by means of which the rings are cut with very smooth surfaces. The drawing shows a front elevation of the machine. Secured to the bed *A* are the stands *B* and *C*. In

the stand *C* is journaled the driving shaft *D* and in the stand *B* is an adjustable center *E* which supports one end of the mandrel *F*, the other end of which is centered in the chuck *G* on the end of the driving shaft *D*. *H* is an eccentric rotary knife journaled in an adjustable bearing attached to the knife carriage *I*. This carriage slides on the shaft *J* and is moved

FIG. 4.—AUTOMATIC TRIMMING AND WRAPPING MACHINE.

longitudinally by the screw shaft *K*. The shaft *J* is driven from the driving shaft *D* by spur gears *L* and the cutting knife is revolved by means of the gears *M*. An intermittent feeding movement is given the threaded shaft *K* by means of the ratchet wheel *N*. This ratchet is turned a short distance each time one of the rollers *O* strikes a roller *P* on the pawl carrier. The strikers *O* are mounted on a disk *Q* on the end of the shaft *J*. The operation of the machine is as follows: The mandrel with the rubber tube upon it is placed in position, the knife support is adjusted and power is applied to the driving pulley, which revolves the mandrel and also the elliptical knife. When that part of the knife of the least radius comes opposite the tube on the mandrel, the feed shaft *K*

FIG. 5.—“PUSH” MANDREL MACHINE.

moves the knife carriage *I* lengthwise a distance equal to the thickness of the ring required. In this way the tube is cut into rings while the knife is in constant rotation.

Further development of the principle embodied in the above original invention has resulted in the following complete line of highly specialized machines for the manufacture of jar rings.

THE IMPROVED PLANAROSA JAR RING MACHINES.

These machines show the progress that has been made in specialized machinery used in modern rubber mills for the manufacture of jar rings. They include an automatic machine for trimming and cloth wrapping the unvulcanized tube on the

curing mandrel; a machine operated by compressed air that removes the cut rings and at the same time forces another uncut tube upon the same mandrel; a duplex jar ring lathe that automatically cuts the rings; and a special alternating grinding machine for grinding the elliptical cutters.

The uncured tube on its mandrel is placed in the right-hand end of the machine shown in Fig. 4, and the ends of the tube are accurately squared and at the same time the length determined by automatic cutters. The tube is then placed on the wet wrapper and the end brought over the tube when it is released and rolls down the incline by gravity—thereby loosely wrapping itself—to the two parallel gear driven rollers on which it rests. The upper presser roller, being automatically raised to permit the entry of the wrapped tube, is now brought down in contact with it, the power applied and after 16 revolutions the cloth is smoothly and evenly wrapped around the tube. The upper presser roller is then released and the wrapped tube rolls down the inclined plane to the end of the machine and is ready for curing.

After the tube has been vulcanized, it is blown off the mandrel by compressed air and placed on the cutting mandrel by the

FIG. 6.—AUTOMATIC JAR RING LATHE.

machine shown in Fig. 5. This machine serves a double purpose by removing the cut jar rings from the mandrel and at the same time applying another tube to the same mandrel.

This “push” mandrel machine consists of a horizontal cylinder containing a piston that is operated by compressed air. A mandrel and tube that has been cut on the jar ring lathe is placed on the concave bed of the machine and the end adjusted to the outer end of the piston. One end of an uncured tube is slipped over the free end of the mandrel, the other tube end being attached to the automatic compressed air valve shown at the extreme left of the illustration. Compressed air is automatically released by this valve and rigidly distends the tube while the piston is operated, forcing the mandrel into the uncured tube and at the same time removing the cut rings.

The jar rings are cut on the automatic lathe shown in Fig. 6, the mandrel being placed between the centers and revolved at a fixed speed. The cutting is performed by two rotary, elliptical knives or cutters mounted on separate carriages that are driven in the same direction by a lead screw. The knife on the right starts on the right end of the tube and cuts to the left, while the other knife starts at the center and cuts in the same direction. There is no reciprocatory motion, which is the most important feature, as it permits running the machine

at a very high rate of speed. The cutting is done by the edge of the part of the elliptical cutter with the greatest radius revolving against the work. As it revolves, the cut is finished and when the part of the cutter with the least radius arrives opposite the revolving mandrel, clearance is thereby provided and the carriages are moved longitudinally for a fresh cut. The movement of the carriages that determines the thickness of the jar rings is automatically controlled by an intermittent worm gearing and star wheel mechanism together with change gears. When the cutting is completed, the machine is stopped automatically. It is claimed that this machine will produce approximately six hundred jar rings per minute.

FIG. 7. ELLIPTICAL KNIFE GRINDER.

A very necessary machine in connection with the jar ring lathe is the alternating knife grinder shown in Fig. 7, specially designed for accurately grinding the elliptical knives. It consists of two oppositely placed, belt-driven emery wheels that travel toward each other. At right angles to the emery wheel shafts are the rocking centers between which the cutter arbor and cutter to be ground is placed. The arbor is revolved by belt-driven gearing and at the same time being rocked by a cam movement so that the elliptical edge of the knife is presented to the rapidly revolving emery wheels and accurately ground.

WASTE MATERIAL DEALERS MEET.

THE fourth annual meeting and dinner of the National Association of Waste Material Dealers was held at the Hotel Astor, New York City, March 20 and 21. Louis Birkenstein, of S. Birkenstein & Sons, Chicago, Illinois, and New York City, officiated at the meeting, and in his address gave an enthusiastic account of the four years' history of the association. The election resulted in the choice of the following officers: Louis Birkenstein, president; H. H. Cummings, James Rosenberg, E. A. Stone, Henry Lissberger, Ivan Reiter and James J. Ryan, vice-presidents; Mark Sherwin, treasurer; Charles M. Haskins, secretary.

At a meeting of the Scrap Rubber Division held March 20, with Paul Loewenthal, of Brooklyn, New York, chairman, it was voted that The Rubber Association of America, Inc., be requested to have a committee meet the Classification Committee of this division for the purpose of drawing up specifications of scrap rubber which would be adopted by both organizations and should be standard for the trade; and that the secretary address a letter to the Rubber Association along the lines of the above motion.

There was considerable discussion as to the buying of mixed tires, the consensus of opinion being that this was a matter which would have to remedy itself and that there was no way for this association to control the buying of its members.

President Birkenstein also presided at the banquet held on the evening of the twenty-first, and made a ringing address which was enthusiastically applauded. Joseph F. McLean, of the Pequannoc Rubber Co., Butler, New Jersey, spoke of the valuable services which the waste material industry is rendering the country's manufacturing interests, alluding to the friendly relations existing between the rubber reclaimers and the scrap rubber trade. Hon. E. C. Stokes, former Governor of New Jersey, gave

a very interesting and witty address and a fine eulogy of the waste material industry.

A pleasant feature of the occasion was the presentation of a handsome silver loving cup to President Louis Birkenstein by the members of the executive committee.

A. S. T. M. RUBBER NOMENCLATURE.

THE American Society for Testing Materials will hold its annual meeting in Atlantic City, New Jersey, during the week beginning June 25, 1917. In accordance with a resolution passed two years ago, there has been appointed a sub-committee on "Definitions for Rubber Products and Nomenclature of Crude Rubber Varieties," with Dr. Frederic Dannerth as chairman. This committee will present a preliminary report of its work at the June meeting.

The committee has prepared the following list of terms, and it is desirous of securing criticisms from the technical men of the rubber industry, with special regard to any additions or omissions which should be made.

GROUP I.

Fine Para rubber
Medium Para rubber
Coarse Para rubber
Para rubber
Heavy Para rubber
Plantation smoked sheets
Machine smoked sheets
First latex crepe
Brown crepe
Crude rubber
Washed and dried rubber
Retired or broken down rubber
Reclaimed rubber

GROUP II.

Scrap rubber
Reclaimed rubber
Alkali reclaimed rubber
High-grade reclaimed rubber
Floating reclaimed rubber
White substitute
Brown substitute
Rubber resins
Pitch hydrocarbon

GROUP III.

Green stock
Rubber cement
Vulcanized rubber
E. cane
Friction compound
Skim ply
Cushion
Bead
Tread

GROUP IV.

Rubber
Rubber hydrocarbon
Synthetic rubber

GROUP V.

Balata
Chicle
Gutta percha
Gumayle
Pontianak
Assam rubber
Cauchó ball
Castilla rubber
Manicoba rubber
Mangabeira rubber
African rubber

GROUP VI.

Eleven terms not recommended for American usage.
Plantation Para rubber
Fine hard cure Para
India rubber
Caoutchouc

The object of the committee in preparing this list of standard terms used in the American rubber industry is to place on record approved definitions for these terms as they are recognized in the American rubber trade, at this time.

The definitions should represent trade usage; should contain no historical matter; should be so clear and concise that they can be used in case of dispute between buyer and seller; should be adopted for use in expert testimony for the courts.

As an example of the value of such standard definitions the committee mentions the case of balata, which is at present imported as rubber (free of duty), while chicle pays a duty of 15 cents and 20 cents. The tendency in such cases is to enter chicle under the name of balata.

NEW JERSEY ZINC CO.'S ANNOUNCEMENT.

The New Jersey Zinc Co., New York City, announces the following prices on Florence brand, French process, zinc oxide, for shipment on contract, during the second three months of 1917:

	Carloads.	Less Carloads.
White Seal	16	16 1/8
Green Seal	15 1/2	15 5/8
Red Seal	15	15 1/8

The above prices are based upon shipments in barrels f.o.b. shipping point with freight allowance as heretofore on carload lots only. The above prices are effective April 1, 1917, and are subject to change without notice.

The Composition of Klingerit Steam Packing.

IN connection with the article descriptive of the manufacture of high-pressure steam packing on page 322 of the March 1, 1917, issue of THE INDIA RUBBER WORLD, the following analysis of the composition of Klingerit by André Dubosc in "Le Caoutchouc & la Gutta-Percha" is of interest.

Klingerit is a pasteboard of amianthus (flexible asbestos), formed of a series of thin leaves spread on both sides with an agglutinant having a basis of rubber and balata. These leaves are assembled and when subjected to very powerful pressure in a special calender, give an exceedingly homogeneous pasteboard.

By subjecting the Klingerit, cold, to the action of a suitable inflator, the rubber and balata with which the sides of each leaflet are coated, can be transformed into a non-adhesive jelly which will easily permit the separation, the numbering and the examination of the loose leaves after desiccation in the drying oven at 100 degrees.

A portion was allowed to swell in a mixture of equal parts of sulphuret of carbon and of tetrachloride of carbon. After remaining in this mixture for four hours, the rubber serving as an agglutinant was completely swollen and it was then easy to separate the sheets which composed the pasteboard.

In a sheet of Klingerit board having a thickness of 3.75 millimeters, 15 leaflets, each of a thickness of 25/100 of a millimeter, were then separated.

The cardboard being 3.75 millimeters thick, the composition $(\frac{25}{100} \times 15 = 3.75 \text{ mm.})$ was found to be correct.

The leaves thus separated were subjected to a microscopic examination: they consist of a felting of long amianthus fibers mixed with about 2 per cent of (cellulose) organic fibers, very much elongated, hollow and imperceptibly attenuated at both ends, colorable after washing with methylene blue and ruthenium red—these do not color the amianthus—with thick walls limiting a fairly large cavity and of a generally uniform diameter.

These are flax fibers mixed with amianthus with a view to giving the thin paper of which the leaflet is constituted, a resistance sufficient to endure the process of coating.

Each leaflet is covered on both sides with a reddish solution applied with a spreader and composed of a mixture of rubber and balata to which is added a very small quantity of sulphur, and dissolved in a suitable solvent, benzine or gasoline.

This varnish represents the agglutinant element in the Klingerit joint and owing to the way in which it is applied, it is easily understood that its distribution in the mass is perfect and that it insures complete cohesion of the various thin leaflets which compose the pasteboard. This is in the main composed of an alternating series of very thin leaves of amianthus and flax, 25/100 millimeter thick, held together by very thin layers of a mixture of rubber and balata to the number of 30; each layer is about 5/100 millimeter thick.

Klingerit, as it is put on the market, is not vulcanized, but contains a sufficient amount of sulphur to allow the rubber and balata to vulcanize when the joint is exposed to heat while in place. Thus a perfect resistance and tightness of the system is insured for the leaflets of amianthus cannot then be reached by the liquids that would induce physical decomposition in them. The most important element of this cardboard is the amianthus.

A sample subjected to incineration leaves 80.463 per cent of ash, which cannot be corroded by acids and is composed of large amianthus fibers which preserve their morphological structure entirely. The ash when chemically analyzed, was found to be composed exclusively of the finest commercial quality of long-fiber amianthus.

In order to estimate the quantity of flax cellulose mixed with the amianthus fiber we converted this cellulose into acetate of cellulose, subjecting it to the action of acetic anhydride and of glacial acetic acid together with some drops of sulphuric acid, used as a catalyst. The reaction took four hours, the liquid being maintained at 60 degrees. After filtration on glass-silk, the solution of acetate of cellulose formed was precipitated by a great afflux of water. The acetate was separated by filtration on a tared filter, washed until perfect neutralization was attained, dried in a sulphuric vacuum and weighed; from the weight of the acetate of cellulose considered as a triacetate, the cellulose content was deduced as 2.237 per cent.

The analysis of the agglutinant is more delicate because it is

composed of a mixture of rubber and balata which is rather difficult to separate.

We have observed that if in such mixtures a solvent composed of freshly distilled sulphuret of carbon and 5 per cent of absolute alcohol be used, the rubber dissolves rapidly while the balata remains insoluble; the reaction must take place in a cold state. By evaporating the solvent in a tared vessel, it is possible, for a given weight, to ascertain the amount of rubber contained. This content has been found to equal 5.185 per cent.

The pasteboard resulting from the preceding exhaustion was then treated with chloroform in a warm state in a Soxhlet apparatus until the solvent passed without any coloration.

This exhaustion took 8 hours, the first passages being strongly colored violet.

The chloroform, transferred to a tared vessel, was distilled and the residue of balata which was determined by the usual methods, was weighed after desiccation to constant weight in the sulphuric vacuum.

The balata content was 11.975 per cent.

The agglutinant is therefore composed of:

Balata ...	11.975 per cent	} 17.160 per cent.
Rubber ..	5.185 per cent	

The quantity of sulphur was found, according to the Henriquez method, by disintegrating the board with smoking nitric acid saturated with bromine. A sulphur content of 0.127 per cent was found.

This figure is low, but because of the inflation of the amianthus caused by the nitric acid, it is very difficult to obtain a perfect disintegration, even if large quantities of nitric acid are employed. Another test made with peroxide of sodium, yielded the higher figure of 0.257 for sulphur, which seems more probable.

In constructing Klingerit we advise the use of 5 per cent of sulphur in proportion to the quantity of rubber and balata.

According to these tests the composition of Klingerit resolves itself into:

Amianthus	80.463 per cent	
Cellulose (flax).....	2.237 per cent	
Agglutinant	17.160 per cent	} Rubber 5.185 per cent Balata 11.975 per cent
Sulphur	0.127 per cent	
Water	0.033 per cent	
	—	
	100 per cent.	

RUBBER IN PLASTIC CEMENTS.

A RECENT review of plastic cements, in "Metallurgical and Chemical Engineering," collects and classifies several of the more valuable formulas and suggestions, gained both from experience and current literature, regarding this class of adhesives. The general methods of plastic cement application, as varied to suit special cases, are stated by the author, J. B. Barnitt, who devotes the following section to rubber:

Because of its toughness, elasticity and resistance to alterative influences, rubber is a very useful cement.

As a leather cement:

(a) Asphalt, 1 part; rosin, 1 part; gutta percha, 4 parts; carbon disulfide, 20 parts

As a resistant to acid vapors:

(b) Rubber, 1 part; linseed oil, 2 parts; fireclay, 3 parts.

A plain rubber cement:

(c) Cut crude rubber in small pieces and then add carbon disulfide or benzol, allowing the rubber to dissolve.

Corks and wood are made impervious to water by soaking them in the above solution.

The use of rubber in calking cements in conjunction with pitch is also noted:

Plastic cements for calking must be both tough and elastic and have the added property of expanding and contracting with the joint to which they are applied:

(d) Pitch, 3 parts; shellac, 2 parts; pure crude rubber, 1 part.

(e) Pitch, 1 part; shellac, 1 part; rubber substitute, 1 part.

(d) and (e) are mixed by melting over a burner.

Port Sunlight, a Model Industrial Village.

By John Barnard, Architect.

THE movement for the better housing of employes, which is occupying the serious attention of leading minds in the rubber, cotton weaving and other great American industries, had its inception in England several years ago. Such garden villages as Port Sunlight, Bourneville, Hampstead and the like are not without their philanthropic aspects, usually providing home comforts and advantages which the operatives had never known before. But they have proved to be a paying investment to the employer, a factor which several American manufacturers were quick to make the most of.

Many firms that must house their employes have discovered that the cost of doing so well is only a little more than being niggardly in the matter, and that the accruing benefits more than offset the additional investment. But the mere housing, however well it may be done, does not provide the only essential to a full measure of success in such a venture. Community spirit, recreation facilities, educational and other welfare features are also important, particularly in locations somewhat removed from any long-established town or city. Therein lies the principal advantage of the English model industrial village over most of the merely real estate developments for American operatives. The

English tavern, offers good rooms and meals at moderate prices for traveling men and other visitors. The museum contains

A FIVE-FAMILY TYPE OF BRICK.

many fine paintings, pieces of sculpture and furniture which have been donated and is a refining influence in the community. Modern in every respect, the hospital takes care of factory accidents and any sickness in the village. Adjacent to the Gothic church of stone lies the cemetery, after the old English manner.

The dwellings, set well back from the street, are mostly of the semi-detached type, from two to ten in a block, four to six being the usual number. Cheaper labor and materials in England, together with the omission of cellars, have made permanent fireproof construction possible. Coal and wood are stored in a small scullery off the kitchen, and there the laundry work is done.

TWO FAMILY SEMI-DETACHED HOUSES, ONE OF BRICK AND TIMBER, THE OTHER WITH SLATE WALLS.

inhabitant of such a town enjoys many interests and benefits in common with his neighbors, and in every sense becomes a citizen with the opportunity to take part in the management of village affairs.

Take Port Sunlight, near Liverpool, England, for instance. There, in a setting of delightfully shaded, curving streets, well-kept lawns, ample shrubbery and beautiful flowers, nestle many attractive houses picturesquely grouped and overgrown with ivy. Scattered here and there among them are the community buildings, including a church, inn, school, hospital, museum, social hall, library, swimming pool, playground, gymnasium, stores, etc. The Sunlight Soap Co. also has a bank and cooperative association giving employes an opportunity to save money and buy stock in the company. Flower gardens here and there beautify the picture and provide the outdoor exercise so essential to the health of factory workers, while vegetable gardens, often in tracts of land by themselves divided in squares for the use of separate families, are important factors in reducing the cost of living. Rivalry as to the best gardens is often very keen. Here as elsewhere hedges are usually employed for division lines.

Of the community buildings, the inn, modeled after an old

A SIX-FAMILY TYPE OF BRICK AND STUCCO.

Most of the houses have lower stories of brick with brick party walls, and upper stories of oak framing filled in with brick or terra cotta and plastered with cement. Some, however, have slate-covered walls over a wood frame, while others have stucco exteriors with no timber-work showing. All roofs are of slate.

[This is the second of a series of articles devoted to the better housing of employes. -Editor.]

What the Rubber Chemists Are Doing.

JOINT RUBBER INSULATION COMMITTEE'S SPECIFICATION FOR 30 PER CENT HEVEA RUBBER COMPOUND (CHEMICAL CLAUSES).

THE following specifications and explanations are from the report of the Joint Rubber Insulation Committee, published in full in "The Journal of Industrial and Chemical Engineering" (March, 1917). The analytic procedure was outlined in THE INDIA RUBBER WORLD (November 1, 1916).

SPECIFICATION.

1. A 30 per cent fine Para or best quality plantation *Hevea* rubber compound with mineral fillers shall be furnished. It shall contain only the following ingredients: (1) rubber; (2) sulphur; (3) inorganic mineral matter; (4) refined solid paraffin or ceresin.

2. The vulcanized compound shall conform to the following requirements, when tested by the procedure of the Joint Rubber Insulation Committee, results being expressed as percentages by weight of the whole sample.

REQUIREMENTS INDEPENDENT OF THE AMOUNT OF RUBBER FOUND.

	Maximum.	Minimum.
Rubber	33	30
Waxy hydrocarbons	4	..
Free sulphur	0.7	..

Red lead, carbon, or organic fillers shall not be present.

REQUIREMENTS DEPENDENT UPON AMOUNT OF RUBBER FOUND.

(Requirements for intermediate percentages shall be in proportion to the percentage of rubber found.)

	30 PER CENT RUBBER COMPOUND.		33 PER CENT. RUBBER COMPOUND.	
	Maximum.	Minimum.	Maximum.	Minimum.
Saponifiable acetone extract..	1.35	0.55	1.50	0.60
Unsaponifiable resins	0.45	...	0.50	...
Chloroform extract	0.90	...	1.00	...
Alcoholic potash extract.....	0.55	...	0.60	...
Total sulphur (Note 2).....	2.10	...	2.30	...
Specific gravity	1.75	...	1.67

3. The acetone solution shall not fluoresce.

4. The acetone extract (60 cc.) shall be not darker than a light straw color.

5. Hydrocarbons shall be solid, waxy and not darker than a light brown.

6. Chloroform extract (60 cc.) shall be not darker than a straw color.

7. Failure to meet any requirement of this specification will be considered sufficient cause for rejection.

8. Contamination of the compound, such as by the use of impregnated tapes, will not excuse the manufacturer from conforming to this specification.

NOTE 1. This specification shall be supplemented by appropriate clauses relating to tensile strength, elasticity, electric insulation resistance and dielectric strength. (See the Wire and Cable Specifications of the American Society for Testing Materials, the Association of Railway Electrical Engineers, etc., for examples of such clauses.)

NOTE 2. The limit on total sulphur may be omitted at the option of the purchaser.

EXPLANATION OF SPECIFICATION.

Experience has shown that compounds of the grade which contains only good *Hevea* rubber, may be relied upon to be more permanent than those made of rubber of other grades. It is not affirmed by the committee that a compound which conforms with this specification is necessarily permanent, or that a better compound cannot be made, but it is believed that enforcement of the specification will limit the use of inferior materials and that it will put the manufacturers more nearly upon equality of endeavor, where they can use their experience to obtain the best

results. Used in connection with the analytic procedure, the specification will enable purchasers to order a good compound and to ascertain, with a greater certainty than heretofore, whether the material received represents the compound specified.

The term *Hevea* applied to rubber means rubber from the *Hevea Brasiliensis* tree, whether wild or cultivated and regardless of the locality in which it has been grown. Para rubber is *Hevea* rubber of the kind originally shipped from the port of Para, Brazil, and comes in several grades. The rubber required by this specification should be *Hevea* rubber of good quality, such as fine Para or best quality plantation rubber.

Carbon is excluded, not only because it is considered, by some purchasers, to be deleterious, but because it interferes with the determination of rubber hydrocarbons.

Red lead is excluded because of the possibilities of its deleterious effects on rubber.

Ozokerite is prohibited because the acetone extract obtainable from it interferes with the separation of the acetone extract obtainable from the rubber, thereby vitiating the assay of the rubber extract. This prohibition is unimportant to the manufacturers, as ceresin, which is permitted, is the essential constituent of ozokerite.

An upper limit is placed upon the rubber in order to prevent the attainment of electrical and mechanical strength by the use of an extra quantity of inferior rubber whose lasting qualities might not be satisfactory.

The hydrocarbons are limited, owing to their tendency to separate from the compound and thus cause porosity.

The free sulphur is limited because an excessive amount may be deleterious.

The maximum limit on the saponifiable acetone extract is to prevent the use of raw or reclaimed rubber with high saponifiable extract. The medium limit assists in forcing the use of *Hevea* rubber, since it is characteristic of the acetone extract from *Hevea* to be largely saponifiable.

The unsaponifiable resins are limited because a low proportion of unsaponifiable resins is characteristic of *Hevea* rubber. A high result might be due to the presence of reclaimed rubber.

The chloroform extract is limited, first to prevent the use of bituminous substances, and, second, to limit depolymerized and under-cured rubber.

The alcoholic potash extract is limited to prevent the use of saponifiable rubber substitutes.

The specific gravity is limited to reconcile the specification of ingredients by weight with the practice of purchasing material by volume.

Fluorescence of the acetone solution is prohibited, as it indicates the presence of bituminous substances, rosin oil or mineral oils.

The color of the acetone extracts is specified to conform with the normal color of the extract of *Hevea* rubber. A darker color indicates adulteration or an inferior grade of rubber.

The hydrocarbons are required to be solid in order to prevent the use of oils and paraffin of low melting point. The shade required is that obtained from paraffin wax or ceresin. Liquid hydrocarbons indicate reclaimed rubber softened with mineral oil, or paraffin of low melting point.

The color of the chloroform extract is specified to conform with the color of dissolved gum in small quantities. The presence of bituminous substances would be indicated by a brown or black color.

It would be desirable that the sulphur of vulcanization be limited to exclude reclaimed rubber, which contains the sulphur of its previous vulcanization, but the committee has not yet developed an acceptable method for determining this quantity. It

is, therefore, confronted with the choice of either placing a limit on the total sulphur or giving up the attempt to exclude shoddy by sulphur limitation. Option is, therefore, given to the purchaser to insert or omit the limit on total sulphur. Such insertion will at times exclude reclaimed rubber and the committee believes it possible to make a suitable compound with this limitation. The committee thinks that a sulphur limit positively excluding reclaimed rubber, would place too great a hardship, in other ways, on the manufacturers. Where the specification is used with no total sulphur limit, the use of many kinds of, or much reclaimed rubber, will be guarded against by the limits of the various components of the acetone extract. When the limitation on total sulphur is omitted, sulphur-bearing fillers, which possess certain advantages, may be used.

This specification should be supplemented by appropriate elasticity and tensile strength tests, in order to add to the assurance that good rubber has been used and that the vulcanization process has been properly carried out; also by appropriate electric stress and resistance tests, to assure proper insulating qualities and homogeneity of structure. The exact value of the limits for these tests will depend upon the use to which the material is to be put.

IMPORTANT SPECIFICATIONS CONTAINING THE JOINT RUBBER INSULATION COMMITTEE'S CHEMICAL CLAUSES OR ANALYTICAL PROCEDURE.

AMERICAN ELECTRIC RAILWAY (ENGINEERING) ASSOCIATION: Standard Specification for Rubber Insulated Wire and Cable.

AMERICAN SOCIETY FOR TESTING MATERIALS: Proposed specifications for Insulated Wire and Cable; 30 per cent *Hevea* Rubber.

NEW YORK CENTRAL RAILROAD CO., ELECTRICAL DEPARTMENT: Specification No. 300.

PANAMA CANAL: Office of General Purchasing Agent, Circular No. 1,038.

SIGNAL CORPS, U. S. ARMY: General Specification No. 581-A, etc.

ALUMINUM NAPHTHENATES.

The properties and method of obtaining aluminum naphthenate is described by G. Nothe in "Le Caoutchouc & La Gutta Percha" (November, 1916). Pure naphthenic acid from Baku petroleum, when treated with alumina, yields aluminum naphthenate, which, according to the method employed, may be a powder or a colloidal mass, very elastic and plastic, not unlike factis. The material is used in rubber mixings and vulcanizes readily. German pneumatic tire manufacturers largely use such a naphthenate manufactured by the E. de Haën Co. Aluminum naphthenate is nearly insoluble in acetone, and gives with chlorides of hydrocarbons very viscous colloidal solutions forming transparent films of great strength. By using a sufficient quantity of solvent the gel which first forms, gives, on gentle heating, faintly yellowish fluid solutions, miscible in all proportions with cellulose acetate producing strong films. The Germans have utilized this material in large quantities as a substitute for rubber, mixed with reclaimed rubber in the manufacture of pneumatic tires during the war.

CEARA RUBBER FROM NIGERIA.

Two samples of Ceara rubber are reported by the Bulletin of the Imperial Institute (1916, volume 14, pages 382-384). These samples were rough sheets prepared from latex tapped by the Lewa system from trees growing in the government plantation at Ankpa, Bassa, Northern Provinces, Nigeria. The physical properties of the samples were satisfactory and the analytical results showed loss on washing: 5.3 and 8.0 per cent on original sample; and caoutchouc, 83.1 and 84.7; resins, 5.3 and 6.3; protein, 9.9 and 7.7; ash, 1.7 and 1.3 on the dry-

washed rubber. A comparison of the second sample with plantation Para sheet, with regard to their behavior on vulcanization gave the following results: Time of cure at 50 pounds steam pressure, Ceara 50 minutes, Para sheet 70 minutes; tensile strength 2,330, 2,300-2,400 pounds per square inch; elongation 847-875 per cent. The ages of the trees from which the two samples were obtained were, respectively, three years and three to four years, their average girth being 15 inches and 18 to 20 inches at three feet from the ground. [Journal Society of Chemical Industry, January 31, 1916.]

FREE AND COMBINED SULPHUR IN VULCANIZED RUBBER.

B. J. Eaton and F. W. F. Day in "The Journal of the Society of Chemical Industry" (January 15, 1917), recount their research on a "Preliminary Investigation on the Estimation of Free and Combined Sulphur in Vulcanized Rubber, and the Rate of Combination of Sulphur with Different Types of Plantation Para Rubber." They found it necessary to devise a special method for sulphur determination in vulcanized rubber. After protracted acetone extraction, combustion of the extracted rubber is effected in oxygen under special conditions. The authors state that the combustion method described would be inadmissible for estimating sulphur in vulcanized mineral mixings, although it enables them to balance the free sulphur and the combined sulphur against the total sulphur and against the original sulphur put into the mixing investigated. This mixing was 90 per cent rubber and 10 per cent sulphur. Three types of rubber were investigated, namely slab, sheet and crêpe. All of these samples were prepared from similar latex and under identical conditions except as to machining. It was concluded that "the percentage of combined sulphur at the optimum time of cure is practically the same for all three types, and this percentage of sulphur at the optimum time of cure is always about 4 to 4.5 per cent, calculated on the mixing. Whether this will be so for all samples remains to be seen."

CHEMICAL PATENTS.

INSULATING COMPOSITION. Phenol condensation compound and solvent. Leo H. Bakeland, Yonkers, New York, assignor to General Bakelite Co., New York City. [United States patents Nos. 1,216,265 and 1,216,266.]

RUBBER COMPOSITION AND PROCESS. The process of making rubber compositions which comprises working together rubber, a dry sulphite waste liquor preparation, a composition of blown petroleum and asphalt, and other body-giving components. [Michael F. Coughlin, Boston, Massachusetts, assignor to American Gum Products Co., Covington, Virginia. United States patent No. 1,217,157.]

SHOE FILLER COMPOSITION. A filling material for shoes comprising a solution of rubber in a solvent, comminuted cork, carbon tetrachloride, and sulphur, the proportions being such that the resulting mixture is plastic and adapted to vulcanize quickly when spread on the bottom of the insole of a shoe. [Adam H. Prenzel, Halifax, Pennsylvania, assignor to United Shoe Machinery Co., Paterson, New Jersey. United States patent No. 1,217,214.]

CAOUTCHOUC-LIKE MATERIAL. A caoutchouc-like body resulting from the reaction caused by adding dichloride of sulphur to a mixture containing a ketone capable of yielding isoprene and caoutchouc. [Herman Stern, Munich, Germany, United States patent No. 1,218,713.]

METHOD OF IMPREGNATING FABRICS. Fabrics are treated with a preparation made by mixing rubber, sulphonated castor oil and sulphur. The treated fabric is dried and finally vulcanized. [Lauritz Peterson-Hviid, Copenhagen, Denmark. United States patent No. 1,219,349.]

LABORATORY APPARATUS.**MEASURING STRETCH OF RUBBER. TEST SAMPLES.**

THE ordinary testing machine is provided with a pair of hand-adjustable pointers, movable on a measuring scale for determining stretch. The operator, with or without assistance, endeavors with these pointers to follow the movement of the reference marks on the rubber sample under test. This method leaves much to be desired as to convenience and accuracy. The following substitute has been found entirely satisfactory. The instrument required consists of a pair of hard wood dividers, made by fastening together, with a quarter-inch screw bolt and thumb nut, two strips of wood $\frac{3}{8}$ inch thick, 1 inch wide and 18 inches long. The bolt should be located about 4 inches from one end. The opposite arms are tapered together to a chisel edge. To use the instrument the operator holds it by one short arm, with the right hand, placing the thin edge of the corresponding long arms on the upper reference mark of sample. Without further attention the instrument moves downward with the upper line as the sample is stretched. The operator follows the progress

of the lower reference mark, opening the dividers with the left hand, keeping contact with the line until the sample breaks. Having to follow but one mark, the operator can do it easily and accurately. The final spread of the dividers, less the original distance apart of the reference marks, gives the actual stretch, which should be recorded in terms of percentage on length of the marked interval.

**ALUNDUM FLAME COLLAR.**

This piece of apparatus is designed to produce uniform conditions of intense heat for igniting in alundum or platinum crucibles. These collars are made to withstand wide variations of temperature. [Norton Co., Worcester, Massachusetts.]

METHODS OF TEST.

THE physical testing of rubber materials as specified by the Board of Estimate and Apportionment, of New York City, reported in the March number of THE INDIA RUBBER WORLD, is continued as follows:

DETERMINATION OF FRICTION OR ADHESION STRENGTH.

The determination of friction or adhesion strength between the rubber and the fabric, or between the layers of fabric, shall be made as follows:

APPARATUS. All friction or adhesion strength tests shall be made on the tensile testing machine.

RUBBER HOSE AND CIRCULAR TEST PIECES.

All rubber hose and other wrapped circular test pieces shall be slipped on a mandrel one-eighth inch wider than the test piece and of the same diameter as the inside of the hose.

The mandrel with the test piece in place shall be slipped on the pin attached to the power head.

The free end of the test piece shall be clamped to the lower head of the testing machine without twisting and centered over the mandrel.

The weight clutches shall be raised and the machine started at the uniform rate of one inch per minute.

After separation commences the load shall be constantly watched to see that it does not at any time fall below the specification requirement.

On the Schopper machine this load shall be recorded on the automatic recording device.

The entire friction layer or layers shall be separated.

COTTON RUBBER-LINED FIRE HOSE.

Cotton rubber-lined fire hose test pieces and test pieces of a similar character shall be tested exactly as prescribed in the foregoing under "Rubber Hose and Circular Test Pieces," except that the fabric shall be fastened to the power head with a clamp instead of a mandrel.

PACKING AND OTHER FLAT TEST PIECES.

Packing and other flat test pieces shall be tested exactly as prescribed for rubber hose, except that a clamp instead of a mandrel shall be used, and either the fabric or the rubber shall be fastened to the lever head according to the thickness of the rubber.

If the rubber is not thicker than one-eighth inch the fabric shall be fastened to the lever head.

If the rubber is thicker than one-eighth inch the rubber shall be fastened to the lever head.

When fabric and fabric are to be separated, the heavier shall always be fastened to the lower head.

When heavy materials like belting are to be tested, the test pieces shall consist of not more than two plies of the fabric for any one test.

DRY HEAT TEST.

The test pieces prepared and measured beforehand are placed in a hot-air oven at the specified temperature for the specified time, cooled to room temperature, the tensile strength and elongation tests made, compared with the untreated specimen, and the reduction calculated to the nearest tenth per cent.

GASOLINE TEST.

Tube and cover test pieces for the gasoline test shall be cut, prepared and measured as specified under preparation of tensile strength. Test pieces shall be completely immersed in 57- to 63-degree Baumé gasoline for a period of 48 hours at a temperature between 60 and 80 degrees F. They shall then be removed, allowed to rest and freely evaporate in air at the same temperature for 24 hours. The tensile strength and elongation tests shall then be made, compared with the untreated specimens and the reductions calculated to the nearest tenth per cent.

Friction strength test pieces shall be made on a one-inch specimen cut for the mandrel test. After treatment with gasoline, as outlined above, the friction strength shall be determined, compared with the untreated specimen, and the reduction calculated to the nearest tenth per cent.

STEAM TEST.

The determination of steam resistance of hose shall be made by connecting three-foot lengths to a steam supply pipe and maintaining the pressure required in the specification for the period called for. The tensile strength elongation and friction strength tests shall be made on the specimens cut, prepared and measured after the steam test, compared with the untreated specimens and the reduction calculated to the nearest tenth per cent.

DETERMINATION OF POROSITY IN AIR HOSE.

The length selected for test shall be subjected to 140 pounds air pressure. The cover shall then be cut lengthwise with the hose for at least two feet. The pressure shall be maintained for five minutes. At the end of this period the length, still under pressure, shall be submerged in water. If there is a distinct escape of air which is not due to the air confined in the structure of the walls, the hose shall be considered porous.

DETERMINATION OF BURSTING OR PROOF PRESSURE.

The determination of bursting or proof pressure shall be made in the following manner:

The hose shall be stretched out on a plane surface in a straight line, connected to the water line or pump and filled with

water, leaving the air-cock open to allow the air to escape. The air-cock shall then be closed and a pressure of ten pounds per square inch applied.

The test shall then begin by taking original measurements with the pressure at 10 pounds.

Pressure tests shall be measured with a standardized gage. The increase in pressure shall be made at the rate of 100 pounds per minute and the hose under test shall be held for measurement not more than two minutes.

The unit specification may sometimes modify the foregoing procedure in regard to the pressure at which measurements are to be taken and the period of time to hold pressure while measurements are being made, in which case the procedure as stated in the unit specification shall be followed.

When called for in the specifications hose shall be subjected to bursting pressure when laid out straight, when curved in a circle of 27 inches radius and when kinked short off.

When the hose is bent flat on itself with a sharp kink and securely fastened in that position for the kink test, the distance from the tail piece of the coupling to the kink shall be according to size and kind as follows:

Kind and Size.	Distance to Kink.
1½-inch fabric and rubber hose.....	15 inches.
2½- and 3-inch fabric hose.....	18 inches.
2½- and 3-inch rubber hose.....	24 inches.

EXPERIMENTS ON THE REMOVAL OF COMBINED SULPHUR FROM REGENERATED RUBBER.

By D. Repony.

CONSIDERING the numerous patents issued for processes of reclaiming rubber scrap, there are a large number of rubber chemists, and many others, who are trying to regenerate vulcanized rubber with the object of removing the combined sulphur. It is not my intention to criticise the value or worthlessness of the average patented process, yet it is not unjust to maintain that the above problem is yet unsolved.

Moreover, it is not my object to describe how this can be accomplished. My intention is merely to give to the readers of THE INDIA RUBBER WORLD my experimenting experience on this problem, with the hope that it may be of value.

Regarding the solubility of vulcanized rubber, when it is passed in solution by boiling with kerosene, etherical camphor oil, oils, liquid tars, nitrobenzol, turpentine, salol, etc., the solubility is more affected by the heat employed than by the solvent.

Under the temperature 130 degrees C. the solution is very slowly obtained, and above 190 degrees C. it is readily obtained, while heating above 200 degrees C. partially decomposes the rubber.

Vulcanized rubber in such solution is not affected in its chemical composition, nor with reference to its combined sulphur.

EXPERIMENTS.

1. Common reclaimed rubber intermixed with powdered caustic soda and subjected to steam heat in the autoclave from 140 to 170 degrees C. for a period of 5 to 12 hours.

2. Just as above, but intermixed with lead filings.

3. Intermixed with lead acetate.

4. Intermixed with iron filings.

5. Vulcanized rubber (auto tires) broken down in smaller pieces and brought in solution with linseed oil at a temperature of 180 degrees C., is poured in boiling 30 per cent caustic soda. The linseed oil becomes saponified and the rubber completely reprecipitated.

None of the above treatments has removed any of the combined sulphur nor improved the product in any way. Of course, the two treatments with caustic soda have removed all the free sulphur, but this I do not consider as an advantage. Liquid tar has great affinity to combine with sulphur, evolving it as H₂S.

6. Vulcanized rubber pieces immersed in liquid tar and ex-

posed in an autoclave to a temperature of 150 degrees C., after 8 hours, will assume the form of heavy cement. This product was afterwards treated with a mixture of benzol and alcohol to effect the separation of the rubber. This resultant product, after analysis, proved to contain all the combined sulphur previously present.

7. Repeated above experiment, with the exception that it was boiled on a hot iron plate so that the product was not exposed to any external pressure that would hinder the formation of H₂S gas. No better result was obtained, however.

EXPERIMENTS WITH NASCENT HYDROGEN.

8. Vulcanized rubber was brought in solution with kerosene, mixed with zinc dust, to which was added dilute hydrochloric acid. Upon stirring and boiling this mixture a large amount of hydrogen sulphide was evolved. Repeated this experiment on rubber free of free sulphur and sulphides, but the same reaction took place. After the treatment the kerosene was extracted with alcohol and refined by means of alcohol and finally washed with water. The obtained product analyzed, showed that some combined sulphur was removed, but in its place was substituted chlorine, and the rubber was badly influenced by the acid. Moreover, this product gave a very poor physical test for reclaimed rubber.

9. Repeating above experiment by substituting dilute sulphuric acid in the place of hydrochloric acid, no hydrogen sulphide was evolved, but the rubber was not in any manner changed.

10. Repeating the same experiment with a solution of oxalic acid, the result was the same as with sulphuric acid.

11. Repeating again the same experiment using dilute acetic acid, and in another case highly diluted nitric acid; in both cases the rubber was oxidized to a powdery substance.

12. Other experiments with nascent hydrogen, the latter being produced by bases replacing H₂ by metals.

Aluminum dust admixed to high grade reclaimed rubber, and rolled out to thin sheets, the latter being immersed in strong, boiling Na OH solution, the reaction takes place vigorously. Of course, in this case the evolution of H₂S cannot be expected. Analysis of this product proves that no part of the combined sulphur has been removed.

13. Repeated the same procedure as above, but instead of aluminum dust, zinc dust was used.

14. Again employed the same reaction with nascent hydrogen by using sodium oxalate instead of metals.

In the two last experiments the reaction was accomplished vigorously, but in no case was the combined sulphur removed, and the obtained product has shown all the same properties that it possessed originally as common reclaimed rubber.

15. One pound of metallic sodium thoroughly mixed with 8 pounds of high grade reclaimed rubber became hot within a half minute after being removed from the mixing rollers. This is partly due to the moisture present in the reclaimed rubber, and partly to the rapid absorption of moisture from the atmosphere. The reaction was so rapid that before I was able to plunge it in boiling water a part of it had ignited. Yet I was able to obtain a large enough sample, which had been subjected to the proper reaction and not burned. Examination proved that by this treatment nothing had been gained; however, nothing had been spoiled.

Among all these experiments doubtless the reaction of nascent hydrogen developed from zinc dust and dilute hydrochloric acid, substituting chlorine for the combined sulphur, is the only interesting one, and may serve as basis for further research work on this difficult problem.

New Machines and Appliances.

THE CHAPMAN NEUTRALIZER.

IT is claimed that the elimination of fire risk in rubber mills due to static sparks, imminent in the operation of spreaders, cement churns and other machines where naphtha is used, may be accomplished by the apparatus shown in the accompanying illustration. It comprises an electric transformer located on some convenient wall and connected by heavily insulated wires to the inductor bars that are attached to the machines to be protected. Briefly stated, the principle is as follows: A direct static charge spontaneously selects from a neighboring

alternating charge the exact quantity and kind to neutralize it. The charge in the material may be positive, or it may be negative, it makes no difference, for the alternating charge has both kinds to select from. The choice is unwavering as Nature's law, and the result is perfect neutralization.

The alternating charge is distributed to the charged material by means of a bar called the inductor placed near the material. The air around the inductor for a distance of a few inches becomes filled with positive and negative charges which are entirely imperceptible to the senses, but which are extremely forceful in killing any other charges that come within the field of their influence.

In the application of this device to a spreading machine, two inductors, extending across the machine and over the fabric, are usually recommended. One is placed just back of the spreading knife and the other is located near the point where the proofed fabric is wound up.

These inductors are placed so that the fabric passes them at a distance of from two to four inches. The influence of the inductors extends through the air for several inches around them, and every portion of the fabric as fast as it comes within this region of influence is imperceptibly but instantly deprived of any electric charge. The result of this action is that the inductor at the head end of the spreader instantly and completely neutralizes every part of the fabric as fast as it leaves the spreading knife, before any charge imparted to the fabric can accumulate sufficiently to discharge to the roll, knife, frame

or pipes in the form of a spark. The object of the other inductor, treating the fabric just before it is rolled up, is to remove any slight charge redeveloped by the other rolls over which the fabric passes before winding up.

When successive coatings are being applied, it is often necessary to place an inductor near the unwinding roll and on the under side of the web as it is unrolling. This inductor is mounted on a hinged frame having a roller resting on the roll of cloth, thus keeping the inductor always in the most effective position whether the roll of cloth is large or small. After the cloth has received two or three coatings it is quite likely to generate considerable electricity at the point of separation of the web from the unwinding roll, the web assuming a negative charge and the roll a positive charge, and an inductor so placed will instantly and completely neutralize both charges at the same time. Recent installations have proved that this is the most effective position for an inductor on a spreading machine. [The Chapman Electric Neutralizer Co., Portland, Maine.]

THE T. & W. TIRE WRAPPING MACHINE.

A tire packaging machine that is guaranteed by the makers to wrap at least 50 bundles per hour and make a tight, compact, evenly wrapped bundle, is here shown. It will wrap bundles 36 inches high, if desired, with paper or burlap, the tires being all of the same size or of different sizes as the case may be.

The machine is operated as follows: A roll 20 inches in diameter and 6 inches wide is placed between two endless chains,

of the noiseless type, and is carried down through the inside of the bale and upward around the outside of the bale, thus wrapping the strip of burlap or paper around the bale as it is rotated by the revolving cones upon which it rests. Two other revolving cones over the bale are so arranged that by turning

a hand wheel they are made to bear down on the bale to any degree of pressure required, insuring an even rotation and tight wrapping. The overlapping is evenly done, the width of the overlap can be easily regulated, and changing from the wrapped bale to the next one to be wrapped is instantaneous.

The machine occupies a space 6 feet by 6 feet, by 7 feet high, and requires $2\frac{1}{2}$ horse power to drive it. Motor drive is furnished if desired. [Terkelsen & Wennberg, Boston, Massachusetts.]

THE WILLS CARTON ERECTING AND FILLING MACHINE.

An extremely light-running, accurate, and rapid machine for cartoning goods in what are called tucked cartons such as are used for boxing rubber heels, fruit jar rings, etc., is the subject of the following illustrated description.

The equipment consists of two units, a carton erecting machine, and a carton filling machine, coupled together and synchronized; all being operated by a $\frac{1}{4}$ horse-power motor. It will handle articles in multiples as well as units. For instance, it can be built to count fruit jar rings into dozens, or will put two heels and a package of nails into each box.

The cartons are placed in a stack, flat or collapsed as they come from the maker, and the articles to be packed are placed on a carrier belt. The machinery erects the carton, closes the bottom, inserts the contents, closes the top, counts the carton, and sends it off on another carrier belt, a complete, symmetrical

package. The speed of this machine depends somewhat on the article packed, but usually runs about 40 packages per minute.

The entire equipment with electric motor and counting device, complete and ready for use, is made to order in accordance with the special requirements of each case. [Arthur J. Wills, North Brookfield, Massachusetts.]

TUNGAR RECTIFIER FOR GARAGES AND SERVICE STATIONS.

To meet the demand for a device that will transform the 115-volt, 60-cycle alternating current supplied to many garages and service stations into direct current suitable for recharging automobile storage batteries, the General Electric Co., of Schenectady, New York, has developed a type of "Tungar" Rectifier of 6 amperes, 75-volts capacity that will charge from one to three storage batteries at a time.

A compensator with 15 taps is attached and a dial switch for adjusting the voltage according to the number of batteries to be charged. The current is instantly adjustable in steps up to six amperes.

After the two upper wires are connected to the alternating current supply and the direct current leads coming out of the bottom of the rectifier are connected to the batteries, which should be connected in series, turning the alternating current switch will start the rectifier charging and without shaking. If the alternating current should fail, the batteries cannot discharge through the rectifier and will start recharging when the current comes on again. Charging costs about 9 cents per 3-cell battery for about a 13-hour charge when groups of ten are charged and about 12 cents per 3-cell battery when charged in groups of

five. The efficiency of the rectifier increases and recharging costs per battery are lowered as the number of batteries on charge is

increased toward the 30-cell, maximum capacity of this type "Tungar."

The entire apparatus, including all live parts, is enclosed in a perforated, japanned finish, sheet iron casing. [The General Electric Co., Schenectady, New York.]

A NEW ELECTRICAL PUMP UNIT.

A novel combination of condensation trap, electric motor and centrifugal pump is shown in the following illustration. The application of this unit to a line of heaters for automatically discharging the water of condensation into a hot-well, low-pressure boiler or feed-water heater, appears to be quite practical where the radiation is below the water line.

The unit is placed below the radiator and the condensation flows into the trap by gravity, the air being taken care of by the air vent and an automatic air valve.

As the trap fills it tilts downward and remains in this position as long as there is any water in the system. In tilting

downward, it throws in a snap switch, starting the motor that is directly connected to the centrifugal pump, and the accumulated water is discharged into the hot-well boiler or feed-water heater.

When the trap is empty it returns to its normal position, at the same time operating the switch that stops the motor and pump. When the trap again fills, the operation of discharging as previously described is automatically repeated. [The American Blower Co., Detroit, Michigan.]

THE FISHER REDUCING VALVE OR PRESSURE REGULATOR.

Steam pressure regulators are of such importance in the modern rubber mill that the following description of a standard type of reducing valve will be of interest:

The diaphragm-actuated type of valve, controlled by lever and weight, has for years been accepted by engineers due to its simplicity and positive action. The illustration is that of a valve particularly adapted to low pressure service, but the type of construction permits the use of different sizes of diaphragms, making it suitable for various pressures.

The valve bodies are iron, except smaller sizes, which are bronze, and the inner valve is a semi-balanced, double-seated type with beveled seats and seat rings ground in and tested under practically the same pressure and temperature that the valve would be subjected to while in operation. This valve will operate with a comparatively small weight and does not require a dash pot as would be the case with a single-seated valve. All valves and seat rings are cast from hard phosphor bronze and the stems are all made from Tobin bronze rods.

In operation the inner valve is normally held by lever and weight. The volume of pressure passing through the valve builds up within the low pressure main and enters the diaphragm chamber through the controlling pipe line. When the low pressure reaches the desired point, a balance is formed with lever and weight, and thus the valve opening is regulated according to the steam consumption and the determined amount of low pressure maintained. [The Fisher Governor Co., Marshalltown, Iowa.]

FABRIC INSPECTION MACHINE.

All fabrics used in the manufacture of rubber goods are carefully inspected. It is, in fact, the first step in their preparation

for calendering or spreading. Every inch of fabric is closely scanned to detect defects in the weave and imperfections in the

finish of the goods. The fabric inspection machine here illustrated is one of the newest types, and therefore of interest.

The roll of fabric comes to the machine on a truck and the end is threaded from the back of the machine between the weight roller and top draft roller above the desk, down to the winding roller in the wind-up attachment. The operator sits in front with foot on the treadle which automatically assumes a neutral position by means of springs. The pressure of the foot forward starts the cloth down the table, and removal of pressure stops the cloth, while pressure on the heel of the treadle reverses the cloth, feeding it up the table.

The horizontal lever shown at the left of the table shifts the belt on the tight and loose pulleys. The power drive shown on the left side of the machine may be mounted on the right hand side so that the machine can be put on either the right or left side of the room and the drive come next to the wall.

The rolling attachment back of the table holds the winding rollers in position with latched levers that can be readily thrown back and the roll of fabric quickly removed. [Parks & Woolson Machine Co., Springfield, Vermont.]

MACHINERY PATENTS.

THE HUNTER DRY KILN.

ACCORDING to this process, the rubber is exposed in humid air that is kept in circulation and provided with a continuous supply of fresh air. The temperature in the dry room is raised as

high as 160 to 170 degrees F. and the rubber dried in 12 to 14 hours. It is claimed that rubber treated by this process, whether it has been previously dried or not, is of a better quality than dried in the usual way.

A cross-section of the dryer is here shown. The air enters at A and rises, passing over the steam coils B supplied from pipe C. The heated air then passes through the upper chamber D and downward into the compartment E where the air is deflected downward by the partition F and passes over the humidifier G, into the rubber treating chamber H. From here the air passes out of the dryer through pipe I and header J to the atmosphere, thus creating a constant circulation.

As the air passes over the surface of the water in the humidifier a certain amount of evaporation takes place, depending on the temperature of the water and the humidity of the air. The quantity and temperature of the water supply is automatically controlled so that the air entering the treating chamber is of uniform humidity. The best results are produced most quickly with an air temperature of 140 to 160 degrees F. and a relative humidity of 30 to 35 per cent.

The long trays containing the rubber to be dried are placed on special trucks and are rolled into the dry room, and it is claimed the relatively moist air and the relatively high temperature produces dried rubber of superior quality in a comparatively short time. [Harry Hunter, assignor to The Hunter Dry Kiln Co.—both of Indianapolis, Indiana. United States patent No. 1,218,261.]

FOOTWEAR ROLLING MACHINE.

The object of this invention is a machine for making rubber-soled footwear irrespective of the construction of the uppers. The illustration is a broken side elevation of the machine and A is an endless motor drawn chain conveyor to which are attached the last holders B. The lining, the inner sole, and a toe-strip are applied to the last, the latter overlapping the lining and inner sole. A rag sole is then applied lengthwise of the bottom of the last, overlap-

ping the inturned edge of the toe-strip. The last is then placed on the conveyor and the rag sole, the inner sole and the inturned edge of the toe-strip are rolled down together by the mechanism *C*. The last is then removed from the conveyor and the counter, heel-piece, vamp, quarter and outer filler or sole piece are applied, the last replaced on the conveyor and the parts rolled down by a mechanism not shown. The toe and heel foxing are then applied

and rolled by a mechanism similar to *C*, when the outer sole is applied and the edges rolled into close contact with the foxings, by a mechanism not shown, the final set or rollers *D* completing the operation. [Myron H. Clark, Malden, Massachusetts, assignor to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut. United States patent No. 1,218,983.]

KREMER'S TIRE BUILDING MACHINE.

The principal object of this invention is to provide a tire shoe making machine that will shape or stretch the longitudinal, median portions of the fabric without stretching the edges in a corresponding manner.

The following briefly describes the operation of the machine shown herewith in side elevation.

The rolls of frictioned fabric are placed upon the four fabric holders,

A, and the strips drawn off by feeding them over the liner reels *B* in such manner that the liners are rolled up on the reels.

From the fabric holders, the frictioned fabric passes to a tension mechanism *C*, which serves to place it under suitable tension or stretching action. The rubberized fabric then passes over shaping rollers *D* that stretch the longitudinal median portions of the fabric, without correspondingly stretching the edges.

The shaping or stretching rollers are yieldingly mounted in any suitable manner, and a registering dial *E* indicates or registers the tension under which the fabric is placed by the stretching devices.

The fabric then passes to the rotary core *F*, upon which the carcass is built up. The reference letter *G* indicates the tread forming and spinning mechanism by means of which the tread is formed and the sheets of fabric are stretched into position, and *H* indicates the bead setting mechanism.

The machine is provided with a change-speed mechanism, and is driven by an electric motor shown at *I*. [Franklin W. Kremer, Carlstadt, New Jersey. United States patent No. 1,216,329.]

THE BAKER SOLVENT RECOVERY APPARATUS.

The illustration is a vertical transverse section of this invention applicable to the recovery of solvents from rubber-coated fabrics.

In operation the coated fabric is constantly moved through the apparatus; the air contained therein is first heated by the reheating coils, thereby decreasing its density, and increasing its evaporating capacity. The heated air is then conducted over the coated surface which is subjected to the heat radiated from the heating coils. The heat lost by the coated fabric and the air in contact with it, due to the latent heat, is made good by radia-

tion from the coil in the upper part of the evaporating chamber. Thus a smaller volume of circulated air effects the same amount of evaporation and a higher concentration of evaporated solvent is reached, as well as more uniform and rapid drying, without risk of overheating. The current of air carrying a large percentage of evaporated solvent, is now cooled to the saturation point by contact with the cooling coils. The mixed air and solvent vapors thereupon acquire their greatest density, and fall

downwardly through the vertical passageway until the condenser is reached. The available part of the solvent is then condensed and removed through the discharge pipe. A portion of the solvent having been separated from the current of air, the latter is again conducted upwardly into contact with the heating coils, thereby decreasing the specific gravity and causing it to again circulate in contact with the coating to be dried. [Theodore Baker, assignor to E. I. du Pont de Nemours—both of Wilmington, Delaware. United States patent No. 1,218,616.]

PROCESS PATENTS.

MAKING CORD TIRE FABRIC.

BY this method cord fabric may be made in lengths greater than can be obtained by cutting standard cord fabrics on the bias. Referring to the drawing, *A* is a cylindrical drum on

which a single layer of cord *B*, *B* is wound in close contact. The drum can be of any reasonable diameter so that fabric of great length may be produced. When a layer of cord has been wound on the drum, a coating of rubber solu-

tion is applied that serves to hold the threads together. The drum is then revolved at high speed and the layer of fabric cut into spiral bands of the required width, as shown at *C*.

After cutting, the completed bands, in which the strands lie at an angle of 45 degrees, are removed from the drum and employed in building cord tire casings in the usual way. While only one layer is shown, it is obvious that two or more layers may be applied to the drum, rubber solutioned and cut in the above described manner. [Ernest A. Pye, Newark, New Jersey, assignor to Musselman Cord Fabric Co., Chicago, Illinois. United States patent No. 1,217,879.]

SEMI-METALLIC PACKING. Fifty to 75 parts, by weight, of fiber, 10 to 30 parts of rubber or other gum, 10 to 30 parts of shredded metal, and 5 to 15 parts of filler are thoroughly mixed together at the required temperature, and the mass rolled into sheets. Thick sheets are built up from a plurality of thin sheets secured together by rubber cement, the sheets being laid, with the shreds of metal lying in different directions. [Louis J. Ryan, assignor to the Royal Equipment Co.—both of Bridgeport, Connecticut. United States patent No. 1,215,064.]

CUSHION TIRE. The body and tread are formed of granulated rawhide impregnated with rubber and the inner tube is made of mercerized rubber-treated fabric of special weave. [Albert H. Henderson, assignor to the Henderson Rubber Co.—both of Baltimore, Maryland. United States patent No. 1,215,275.]

MISCELLANEOUS PATENTS.

THE THROPP PNEUMATIC CUSHION TIRE.

IT is claimed that the qualities of the pneumatic tire are combined with the well-known advantages of the cushion tire in this invention. Moreover, the tire is permanently attached to

the rim with a hard rubber compound, and is vulcanized by the open cure, wrapped tread process.

Referring to the illustration, a transverse section of the tire in its mold, *A*, is the rim on which is first placed a layer of a hard rubber compound, and a strip of frictioned fabric *B* being circumferentially laid thereon. Another layer of rim compound is then applied and a second fabric strip *C* superposed, followed by still another layer of rim compound,

over which is placed a third fabric strip *D*. The rim is then filled to the level of its edges with rim compound, on which is laid a layer of softer compound followed by fabric strips *E* and *F*.

The air valve *G* of the inner tube *H* is then forced through the opening in the rim and inflated sufficiently to hold its circular form. After a layer of soft compound is laid around the inflated tube, the fabric strips *E* and *F* are formed around it, and a second layer of similar compound superposed and covered by the outer edges of the fabric strip *D*. Then a third layer of compound is applied and covered by the fabric strip *C*, followed by a fourth layer covered by fabric strip *B*.

More compound is then laid on, including a breaker strip and tread portion when the tire is placed in the mold, wrapped and vulcanized. [Peter D. Thropp, assignor to the De Laski & Thropp Circular Woven Tire Co.—Trenton, New Jersey. United States patent No. 1,217,665.]

A FRENCH PUNCTURE-PROOF TIRE.

The object of this invention is to eliminate the usual tread and breaker strip in the construction of pneumatic tires. The casing is built up in the usual way, but without the tread, however, and is afterwards cured in the ordinary manner.

The tread band *A*, shown in the upper illustration, is an annular sheath of sheet metal that is slipped over the tire before inflation, being centered and held in place after the tire is inflated by the annular, median groove *B*. The metal band completely covers the tread and the sides extend down far enough to protect the

tire against puncture. The sides are also far enough away to allow the expansion and contraction of the tire while in use. Both sides of the band are perforated around their entire circumference; a few of these perforations are shown at *C*, which are intended to prevent the accumulation of mud and dirt. To prevent the band from slipping off the tire in case it should become deflated, six pairs of metal clips *D*, shown in the lower drawing, are removably attached to the rim by transverse bolts. A modification consists of a solid rubber tread *E*, vulcanized to a metal rim *F* welded or riveted to the band *B*. [R. de Prandieres. French patent No. 481,350.]

New Goods and Specialties.

FIBER SOLE WITH MOLDED LIFT.

IN the present condition of the leather market, the demand for fiber-sole shoes, in which rubber is used, can scarcely be overestimated. Improvements in composition and adaptation for the intended purpose are constantly being made, and the fiber sole shown herewith contains an entirely new feature for which special merit is claimed. This improvement is in the form of a lift of the same material, molded on the sole and obviating the necessity for the usual cork filler in the space between the outsole and the insole of the shoe. The solid fiber supports the insole, maintains the welt in position, and increases the wearing capacity. The raised part, when on the shoe, gives the edges a pulling power in the opposite direction, offsetting the pull of the welt and preventing it from returning to its original position when stitched to the upper and thereby causing the edges of the sole to turn up—

a common fault in fiber-sole shoes. The construction of the sole also prevents air pockets under the outsole which are very disagreeable when stepping on a small stone.

It is possible, with this sole, to add one-half of the thickness at the point of wear and yet maintain as thin an edge as required for good appearance on women's shoes. [Donnelly Machine Co., Brockton, Massachusetts.]

KOSSUTH DATER WITH SOLID RUBBER BAND

The usual device for date stamping has a number of rubber bands covering a metal revolving apparatus, but in the self-inking dater, here illustrated, rubber projections with the imprint of the necessary dating type are molded in a solid rubber band. The action of a new style date slot prevents corrosion from contact with the rubber date band, insuring the free entry of dates at all times. The movement is roller bearing and is claimed to eliminate practically all friction to the wearing parts. The frame is of heavy steel throughout, with no extra swinging plates or attachments. A supplemental die plate takes the printing die and holds the type in perfect alinement. The Kossuth dater is made in two sizes. In the one shown the die plate measures $2\frac{1}{8}$ by $1\frac{1}{2}$ inches. [R. A. Stewart & Co., New York City.]

PUBLIC NOTICE ON A RUBBER MAT.

A neat combination of utility and comfort is seen in front of a hotel doorway on Broadway, New York City. A large rubber mat, perhaps 20 feet long and covering half the width of the sidewalk is of the usual perforated pattern, but has in letters a foot long the words "Keep This Space Clear," a standing notice to chauffeurs and coachmen not to occupy the street in

front of the doorway except when taking on or delivering passengers.

"TYRIAN" FIRST-AID TOURNIQUET.

A tourniquet that can be quickly applied and that holds fast at the desired tension is a valuable adjunct to first-aid equipment, and the "Tyrian" tourniquet, here shown, is specially de-

signed to meet these requirements. It is made entirely of rubber, 3 feet long, $\frac{7}{8}$ inch wide and $\frac{1}{8}$ inch thick, with a nickel-plated clasp and spring attachment which affords a firm fastening, easily secured. To apply this tourniquet the lever at the spring is depressed, the loose end of rubber inserted, the pressure relaxed in the spring and the rubber drawn to the desired tension. [Tyer Rubber Co., Andover, Massachusetts.]

PNEUMATIC CUSHION HEEL.

In the rubber heel here shown, a mechanical cushioning device which operates automatically supplements the beneficial effect of the usual rubber heel. When a heel built on this principle is attached to a shoe, the central portion, indicated in the illustration, strikes the ground first at every step taken. Owing to the construction of this central tread portion, with its recess and cooperating pneumatic chamber, it will be forced inward,

compressing the air therein and absorbing the first shock, thus bearing the heaviest part of the impact while the wearer is walking or standing. After being forced inward, the centrally projecting tread portion will be flush with the peripheral tread portion, the latter acting in turn as a cushion, in the same manner as any ordinary solid cushion rubber heel. A cupping or suction is thus produced between the peripheral tread portion and the street pavement or ground surface, insuring a firm grip and anti-skid quality, which is claimed to maintain its efficiency during the entire life of the heel.

This principle may be carried out for the sole of a shoe and is particularly applicable to the requirements of athletic footwear. The special advantages claimed for this heel are reduced weight and consequent saving in cost of manufacture; greater resiliency, and sure grip. [Oscar Mussinan, New York City.]

ALL-WEATHER SLEEPING BAG.

The sleeping bag shown in the accompanying illustration is designed for maximum comfort and protection while sleeping outdoors. The light weight, rubberized material used is suitable for all kinds of weather, a woolen blanket wrapped around

the body affording extra warmth if needed. A hood protects the head, and a netting is attached by special fasteners to keep out the mosquitoes. Plenty of room is afforded, the dimensions being 7 feet 6 inches in length and 4 feet 3 inches wide. The bag is fitted with an inside pad and bolster, pockets for valuables, and a rattan bow which is adjusted when in use, to hold the hood in place. [C. W. Sirch, Los Angeles, California.]

LACED MILITARY RUBBER BOOT AND "TENAX" SOLE.

An exceptionally neat appearing rubber boot favored by army officers is shown in the accompanying illustration. It is made on the straight lines of the army leather boot, drawing on with more difficulty than the old-style, loose-top rubber boot, but appearing to much better advantage when on the foot. The novelty in this model is contained in the 6-inch lacing up the side, this innovation meeting the demand of those requiring slightly fuller dimensions around the leg. This boot is made in tan color, thus more closely resembling the regulation leather military boots and more in keeping with the uniforms now in vogue at the front.

To meet the insistent demand for satisfactory substitutes for sole leather, a new composition material called, "Tenax" has been evolved by the same manufacturer through painstaking experimentation and thorough testing of results in actual wearing practice. It contains sufficient rubber to impart proper flexibility and to protect the feet against wet pavements and walks, and it is claimed that this material possesses remarkable non-slip qualities, cuts to ad-

vantage and holds stitches well, being similar to leather in strength and toughness, lightness and long wear. It is made in

the various shapes and thicknesses required by the trade and is also supplied in rolls. [Gutta Percha & Rubber, Limited, Toronto, Canada.]

PRODIUM TRUCK TIRES.

A new feature in the tire equipment of 1917 commercial cars is the Prodiun truck tire. This is a new pressed-on type of the channel-base tire with a wide tread that is designed to carry heavy loads. It is made from special compound that produces a soft, flexible and resilient tread of unusual tensile strength and durability. This tire is made in all sizes and in order to facilitate prompt service to customers, all branches of the company are equipped with tire applying presses. Tests have been made under severe road conditions in which tires of this make are said to have averaged better than 12,000 to 14,000 miles. [The Republic Rubber Co., Youngstown, Ohio.]

**ALL-RUBBER "HYDRO" SUIT.**

The adaptation of rubber and rubberized materials in clothing for various purposes is constantly increasing, with added improvements and devices for the comfort and protection of the wearer. The all-rubber one-piece costume shown herewith is now in use on many of the United States submarines. It is made of the best rubber sheeting, all seams being steam vulcanized. The belt at the waist and removable straps at the trouser knees prevent the suit from drooping when in use and afford adequate knee room. The elastic wrists fit tightly and the neck has tie-straps for close fitting.

The rubber cap worn with this "Hydro" suit has snap fastenings and an adjustable cape which reefs close with extra studs. The wearer is thus completely covered with rubber from head to foot. [Abercrombie & Fitch Co., New York City.]

**RUBBER PORK BAIT.**

The use of strips of pork rind as a bait in fishing has long been recognized by those "in the know" as a first-class fish-catcher. It is white in color, flexible, and possessed of a tantalizing wiggle.

Pork bait is now successfully imitated and also improved upon by using specially prepared, pure, white rubber with white, red or black heads, in the form shown in the accompanying illustration. This rubber bait is, of course, extremely flexible, responding to the slightest movement, and it is claimed to imitate perfectly the action of a live minnow. An evident advantage over the actual pork rind is its lasting quality, one rubber pork bait being used many times. It is made in two sizes: 3½ inches long for bait casting, and 2 inches long for fly fishing. [S. Arnold, Kansas City, Missouri.]

RUBBER EYE CUP.

An eye bath made entirely of rubber is formed with a bulb portion by which the liquid is forced upwards against the eye. The neck, which may be stiffened by thickening or corrugating its wall or by means of a rigid collar, is provided with a soft ringed edge. A perforated check-plate may be fitted in the base of the neck. [H. St. C. Mason, Hendon, Middlesex, England. British patent No. 102,870.]

**RUBBER TUBING FOR WOUND IRRIGATION.**

A new and remarkably successful treatment for infected wounds, which was mentioned in the January, 1917, issue of *THE INDIA RUBBER WORLD*, embodies the use of various rubber tubes for continuous irrigation with a special antiseptic solution. The apparatus for this method of treatment, designed by Dr. Alexis Carrel, consists of sterilized rubber tubes, the ends of which are perforated with many holes, covered with sponge tissue and introduced into the wound, as many of them as may be needed to reach its every part. The tubes lead up to a glass tube with several lateral orifices to each of which a rubber tube is attached. The solution flows from a glass receptacle through a rubber pipe into the glass tube and thence through the rubber tubes to the wound, its flow being regulated either by a drop-counting apparatus or by clamps upon the tubes.

When the wound becomes thoroughly sterile it is sewn up, and a favorite sewing of Dr. Carrel's for large, deep wounds closes like a laced shoe; two broad strips of adhesive plaster, each bearing a row of hooks, are stuck to the skin along the edges of the wound and a pair of rubber laces is twisted back and forth and drawn tight, thus obviating the necessity of sewing through the skin.

AVIATOR'S HOOD.

The aviator's hood here illustrated is made of rubberized material shaped to fit the head closely, yet comfortably, with a single strap fastening that is easily attached. These hoods are exceptionally neat in appearance, and are claimed to be lighter in weight and less mechanical than many others, while preserving all the necessary protective qualities. They are equally suitable for professional automobilists to wear while competing in road races. [Sanders Co., Indianapolis, Indiana.]

**"PNEUMASTIC" TIRE FILLER.**

A new tire filler, consisting almost entirely of rubber, the slight proportion of other ingredients adding to its toughness and long wearing qualities, is now on the market. The substance thus formed is very light and resilient, and it is claimed that "Pneumatic" possesses extreme flexibility, uniformity of power and greater momentum, with entire absence of heat and friction, giving increased mileage from tires without sacrifice of riding comfort. The claims of the manufacturer are substantiated by a written guarantee for a period of two years, free replacement being made should the filler prove defective in any way during that time. [The Altenburg Tire & Rubber Co., Davenport, Iowa.]

1914-1916 RUBBER PRICE ADVANCES SMALL.

THAT the rubber industry has fared exceptionally well in respect to its most important raw material since the outbreak of the European war is gleaned from a report just issued by the Bureau of Foreign and Domestic Commerce, Miscellaneous Series No. 52. Wholesale prices of leading articles in United States markets at frequent intervals from January, 1914, to December, 1916, New York, Boston and Chicago quotations, are tabulated, and indicate that whereas crude rubber (Upriver fine) had increased only 27.6 per cent at the end of the period, leather, hides, wool, manila, lead and zinc had nearly doubled; iron, steel and sisal hemp had more than doubled; while Bessemer and open-hearth steel had trebled. Cotton had increased 39 per cent in price; jute butts, 36 per cent; raw silk, 26.5 to 42.8 per cent, according to grade; and mohair 48.6 to 71.4 per cent. The only important raw materials mentioned which had undergone less increase than rubber were tin, 12 per cent; jute, 13.8 per cent; crude petroleum, 14 per cent; and silver (London quotations 0.925 fine) 26.7 per cent.

THE MARKS RECLAIMING PATENT.

It may be remembered that in *THE INDIA RUBBER WORLD* of January 1, 1916, a full report was published of a decision of the United States Circuit Court of Appeals affirming the decision of the District Court in Buffalo, New York, sustaining the validity of the Marks or "Alkali" patent for rubber reclaiming. The latest phase of the case is the decision handed down March 12, 1917, which affirms the decision of the District Court in Ohio, thus holding that the patent is invalid. It will, therefore, be seen that these two decisions, diametrically opposite, have both been affirmed by higher courts and the questions of the validity of the patent and of infringement are still undetermined.

RECOVERY OF RUBBER AND FABRIC FROM TIRES.

In practically all processes for reclaiming rubber from tires the fabric is destroyed. In these days of conservation, however, the recovery of the fabric as well as the rubber is well worth consideration. In the lists of chemical patents printed in the May and November, 1916, issues of *THE INDIA RUBBER WORLD*, brief mentions were made of a process having the above economy for its object, as worked out by C. de Villers, of Neuilly, France.

In the preparation of rubber cements it has already been proposed to employ tetrachlorethane as a rubber solvent. De Villers uses this substance, heated to a boiling point, for the purpose of dissolving the rubber and also a second time, for freeing the rubber from sulphur.

The tires are placed in a closed receptacle containing tetrachlorethane, enough of the latter being used to completely cover them. The vessel is heated, directly or by means of steam, to the boiling point, and the vapors produced are passed into a condenser. At first the rubber swells and then dissolves into a liquid, and at the end of an hour the fabric is completely freed of rubber. This mass is next sent to the filter press to separate the fabric from the rubber in solution, and since the supply of tire fabric is so much smaller than the actual demands after further cleansing, this fabric can be utilized to advantage.

The rubber is then precipitated from the solution by the addition of water. To free this rubber from sulphur it is subjected to a first treatment with tetrachlorethane, which is prolonged until the rubber begins to swell, indicating that the free sulphur is then dissolved. This tetrachlorethane charged with sulphur is allowed to run off and is replaced by a second quantity of fresh tetrachlorethane which, after having been brought to boiling point, dissolves the desulphurized rubber. It will be seen that this treatment passes through two phases, tetrachlorethane only being employed.

JUDICIAL DECISIONS.

DUNLOP RUBBER CO., LIMITED, v. MICHELIN TYRE CO., LIMITED.

This was a claim by the plaintiffs, who sought to recover damages for alleged libel; also an injunction to restrain from publication of the matter complained of. The defendants denied publication of libel, or that the publications referred to plaintiffs and bore defamatory meaning or were capable of malice. They plead privilege of the occasion and counter-claimed for damages and alleged libel; plaintiffs in reply denied libelling the defendants.

Plaintiffs complained that the Michelin company had attacked their honesty and integrity in their advertisements which appeared in the same newspapers and were designed to have a greater effort upon readers by repetition.

In their counterclaim the defendants stated that the plaintiffs had advertised against them, attacking them as foreigners responsible for the sale of rubbish.

After due deliberation the jury found for the plaintiffs on the claim, with £1,000 damages, and for the defendants on the counterclaim with £750 damages. ["The India-Rubber Journal," London, February 17 and 24, 1917.]

ADAMSON v. GILLILAND. This is a suit brought by the petitioner for the infringement of a patent for a vulcanizing device.

This device consists of two sheets of metal, between which, when heated, the material is to be vulcanized. The upper side of the upper of these sheets is shaped like a cap in which gasoline can be placed to heat it.

Defendant admitted making and selling devices like the plaintiff's, but testified that he made them first. The plaintiff put his invention on the market in November, 1911, and the defendant did not put out his vulcanizer until February or March of the following year; but the defendant declared that on August 7, 1911, 12 days before the plaintiff made the drawing of his invention, he had had castings made that are identical with plaintiff's device. The plaintiff's cup had pins projecting from the bottom arranged in circles around a central one, which he declared served to conduct the heat of the flame downward into the vulcanizing plate and the combustible fluid. Defendant's original castings showed a similar arrangement; he explained that the similarity was accidental; that the pins were of no use and that they were merely there to be used as a talking-point to deceive the public.

It was held that since plaintiff had made public his device, while defendant had not, and there was no other channel of information between the two, plaintiff must be regarded as the originator of the device. In a previous suit by the plaintiff, District Judge Geiger decreed for the plaintiff. The district judge, after hearing and criticizing additional evidence, said that the new testimony would not have changed Judge Geiger's opinion. The circuit court of appeals, regarding the action of the district judge as a yielding to the authority of the former decision, reversed the decree upon the evidence as it stood in print. [United States Supreme Court.]

LEONARD HARTUNG v. TEN BROECK TYRE CO., INC., Louisville, Kentucky. This was an appeal from the Circuit Court, Jefferson County, Common Pleas Branch, Fourth Division, which decided in favor of the defendant in the action for injuries by Leonard Hartung against the Ten Broeck Tyre Co. Hartung declared that a large counter weight on a lever which he operated became detached, the lever flew up and struck him in the breast, injuring him. It was held that there was not sufficient evidence of negligence on the part of the defendant. Judgment was affirmed. [Southwestern Reporter, Vol. 190, page 677.]

EUREKA FIRE HOSE CO. v. FURRY, CITY TREASURER, Van

Buren, Arkansas. This was an appeal from the Circuit Court, Crawford County; James Cochran, judge, which decreed for defendant in the cancellation of warrant's action. After purchasing hose from the appellant and issuing a warrant therefor, the city, Van Buren, called in its warrants.

Counsel for appellant contended that the special act attempting to raise Van Buren from a city of the second to a city of the first class is void, and all proceedings by officers of Van Buren as a city of the first class are void, including the call of the city's warrants for cancellation and reissuance.

It was judged that the officers were *de facto* officers acting under color of an election and at a time when the special act had not been declared unconstitutional, and their proceedings were therefore valid.

Judgment was affirmed. [Southwestern Reporter, Vol. 190, page 1427.]

FREY v. MARVEL AUTO SUPPLY CO. ASPECTS OF PATENTS. United States Circuit Court of Appeals, Sixth Circuit, decided that, even though every element of a patented combination covering a mechanical device be old, there may still be patentable invention if, by the combination, a new and useful result be produced, or an old result in a new and materially better way. [The Federal Reporter, Vol. 236, page 916.]

TRADE-MARK DECISIONS.

Among recent trade-mark decisions of interest to the rubber trade might be mentioned the following:

It has been decided that the name "Horseshoe" as a trade-mark for automobile tires, casings and tubes is not descriptive, even if, as supposed, the tread of the tire bears projections in the shape of a horseshoe. This decision further states that there is no mechanical advantage arising from this feature of the tire and the name is no more descriptive than the figures 4-11-44 would be if the projections were made in the form of these figures. As to the tubes, the mark is certainly not descriptive since the objection does not apply to them.

The trade-mark is allowed of a design showing the picture of a pneumatic tire within which is the head of a chauffeur, and above it the head of a bulldog grasping in its mouth the letters ALWASHOLD, in a peculiar form of lettering. It has been decided that this word is not descriptive as applied to a material for repairing tires. The other features overshadow the word in any event, but this is more than a case of misspelling of a descriptive word as the words themselves can only exist in connection with the bulldog's head.

In this connection it will be interesting to note that, according to the "San Francisco Chronicle," the Secretary of State of California has denied registration of a trade-mark to the Dam Sure Puncture Proof Co. because the mark for which application for registration was made was considered profane and its use, therefore, contrary to public policy. Not only this, but it was pointed out to the applicant company that the words were in any event descriptive of the goods and hence not registrable.

RUBBER INSPECTOR'S POSITION OPEN.

The United States Civil Service Commission announces an open competitive examination for inspector of rubber to fill a vacancy in the Quartermaster's Corps, Philadelphia, Pennsylvania, at \$1,200 to \$1,500 a year, and future vacancies requiring similar qualifications. Examinations may be held at cities near the residence of applicants, certain cities in each State being named. The date of examinations is April 18, and any men who desire to apply should write at once for form 304 to the Civil Service Commission, Washington, District of Columbia, stating that the examination desired is for "Inspector of Rubber (male)."

The Editor's Book Table.

YEAR BOOK OF THE LATEX AND RUBBER SOCIETY, 1917. 1918. Compiled by C. Drieberg, B.A., F.H.A.S., Colombo, Ceylon.

SECRETARY DRIEBERG has collected in this small volume a real compendium of agricultural and horticultural information of this important tropical island. It seems as if no practical hint which could be helpful to the vegetable or fruit planter is omitted. There are crop notes on cotton, tobacco, kapok, castor bean and dhall; veterinary notes, pests and diseases, and many rules, useful hints, etc., but practically no mention of rubber in any form. The list of officers and members is given; there is a clear, readable map, which shows in colors the annual rainfall. Not the least interesting feature of the book is the advertising department, consisting of a number of pages following the text.

MEDEDEELINGEN VAN DEN RYKSVOORLICHTINGSDIENST TEN BELANG VAN DEN RUBBERHANDEL IN DE RUBBERNIEUWHEID TE DELFT. Second series, 1916. Afdeling Handel, Lange Houtstraat 36, 'sGravenhage. [Paper cover, 544 pages. Many illustrations, diagrams and statistics. Price 2.50 florins.]

This publication of the Department of Commerce of the Netherlands Government contains numerous interesting reports of experiments and investigations in various departments of rubber chemistry and manufacture. A very elaborate introduction, besides expressing general ideas on inquiries pertaining to rubber, classifies the contents of the widely differing articles. This classification has six main divisions: (1) Inquiries in latex and judgment of crude rubber by its appearance; (2) chemical examinations of crude rubber; (3) the viscosity of crude rubber solutions; (4) depolymerization and oxidation of crude rubber; (5) experiments in vulcanization and examination of the vulcanized product as a basis for the inspection of crude rubber; (6) inquiries into the process of vulcanization.

An interesting article under the first heading is that by Professor G. V. Iterson, Jr., in which is explained and described an apparatus for determining the rubber content of latex. A report of the results of a scientific test of empiric judgment of crude rubber lays stress on the advantages and improvements that would arise from a general use of scientific methods in examination.

Attention must also be called to a review of the chief methods employed by the *Voorlichtingsdienst*, a series of mechanotechnical investigations and an essay on the great importance of chemical investigation for the future of plantation rubber. Among the papers concerning rubber inspection is one describing simplified methods for inspecting crude rubber, and another on the desirability of international inspection of crude rubber. The latter cites several methods as employed by foreign investigators and deplores the fact that fixing an international standard of inspection presents so many difficulties, owing to the lack of agreement of authorities on several important scientific points.

A report of the analysis of several products from lactiferous trees of Surinam and a comparison of gutta percha mechanically extracted from leaves and from stems of trees on the government gutta percha plantation of Tjipetir ought to interest many.

Valuable are the great number of clearly described experiments which concern problems, such as the effect of treatment with the washing mill; determination of resin content and its influence upon vulcanization; miscellaneous physical tests of vulcanized rubber; viscosity of rubber solutions; unsaponifiable resins; the influence of solvents on viscosity and porosity; improvement of rubber by heating in carbonic acid atmosphere; maximum of sulphur with which rubber unites; influence of time and temperature and the quantity of sulphur

used upon the properties of vulcanized rubber; observations on cold vulcanizing; the insolubles in rubber; the absorption of moisture by raw rubber in various atmospheres; paraffin as a filler for rubber; resin and impurities in balata and gutta percha.

MANUFACTURING COSTS AND ACCOUNTS. BY A. HAMILTON Church. McGraw-Hill Book Co., Inc., New York City. [8vo, 447 pages, illustrated. Price, \$5.]

The importance of an accurate system of cost accounting is one which is appreciated by every up-to-date industrial and commercial establishment. The author of this work has written a very exhaustive treatise as to the proper methods of keeping cost accounts in so simple a manner as to be readily understood. A number of methods are explained fully and their merits compared. There are chapters devoted to sales and selling expenses and to summarizing results. A large number of forms are shown, these being copies of cards, loose leaves, etc., in actual use in manufacturing establishments. At the end of the work is a department devoted to factory reports and returns, those of the foreman, the superintendent, and the executives. These reports are analyzed in order to show the efficiency of the workmen, the expenses of idle machinery, and the general department efficiency. With these reports brought into practical use the proprietors or management can tell the progress of the business and its exact standing at the time these reports are made.

While this latter department is devoted practically to machine shops, there is much in it which is adaptable to any factory using machinery, and the book contains a greater amount of theoretical and practical matter regarding costs and cost accounting than one would imagine could be packed in a single volume.

PHYSICAL AND CHEMICAL PROPERTIES OF GASOLENES SOLD IN THE CALENDAR YEAR 1915. By W. Dean. Government Printing Office, Washington, D. C. Price, 10 cents.]

This is the report of the investigation of government experts. It is mainly devoted to the study of values for combustion engines. Care has been taken to submit facts impartially, leaving to the reader the determination as to the superiority or inferiority of one kind over another for his individual purpose. Many tests were made—specific gravity, evaporation losses, calorific value, sulphur determinations, engine tests and content of unsaturated carbons. Eastern, Mid Continent and California gasolenes were tested, as were also cracked gasoline, blended casinghead gasoline, and "straight" refinery product. The results are tabulated, and summarized, and make valuable reading. A fact that deserves mention is the undesirability of attempting to use motor gasoline as a solvent. This is shown by the high boiling points of some of the constituents in many gasolenes tested.

HANDBOOK OF CHEMISTRY AND PHYSICS. FIFTH EDITION. Chemical Rubber Co., Cleveland, Ohio. [Cloth, 414 pages, 4 by 6½ inches. Price, \$2.]

This handbook is already known to many chemists in the United States, it being a favorite ready reference book of chemical and physical data. The fifth edition is a revision of the previous one, under the direction of Professors Charles B. Hodgman and M. F. Coolbaugh of the Department of Chemistry at Case School of Applied Science. Although small enough to fit easily in the pocket, it is packed full of chemical and physical facts and tables, so arranged as to be readily found. The present edition is about 60 pages larger than the previous one. Among the new features added is a new and more com-

plete table of gravimetric factors, and other important additions are a table of physical constants of the more common organic compounds and a five-place logarithm table. The book will be found very useful by every chemist and in every chemical laboratory.

NEW TRADE PUBLICATIONS.

J. P. DEVINE CO., manufacturer of vacuum dryers, solvent recovery apparatus, and other lines for similar purposes, has just published its "Miniature Bulletin No. 105," descriptive of apparatus required mainly by the chemical and allied industries, but containing some notice of apparatus used in rubber goods manufacture, chiefly autoclaves, kettles, and vacuum dryers. The bulletin is a small one, measuring about four by six inches, containing 32 pages, of which most of the left hand ones are blank. Each right hand page has a strikingly effective cut of one specialty, with a terse description, well displayed. A view of the experimental laboratory is interesting, and the pictures of the exterior and the interiors of the plant show the extent of the establishment.

* * *

The Southwark Foundry & Machine Co., Philadelphia, Pennsylvania, issues its catalog of valves and presses in a self-binder which enables its customers to keep it constantly up to date. Each page, 8½ by 11 inches, is devoted to one or more cuts and description of a single machine, the cuts being wonderfully well-executed half-tones from retouched photographs, and the descriptions comprehensive and accurate. The steam platen presses, tire-forcing presses, bead presses, hydraulic heater presses, quick opening vulcanizer doors and other specialties for the rubber manufacturing industry are fully presented in the latest issue.

* * *

The Akron Rubber Mold & Machine Co., Akron, Ohio, is sending to the trade a very complete catalog of its specialties for tire building and tire manufacturing. This contains in its 48 pages practically every mechanical requirement for these important lines of industry. The machines and other items of equipment are well illustrated, the cuts showing finely all the details, and each is fully described. To give a list of these would demand more space than is available, but the catalog is one well worth securing and filing.

* * *

Gutta Percha & Rubber, Limited, Toronto, Canada, sends out its catalog of Maltese Cross Rubbers, season of 1917-1918, in a finely printed book of 64 pages, with covers handsomely illuminated with the trade-mark of the company. The styles and shapes are pictured in excellent half-tones, and the descriptive text is given in both English and French. With this is sent a smaller booklet, containing net prices, particulars regarding packing, and other information of the line.

* * *

"War Loans and the United States" is the title of an absorbing pamphlet, issued by the Guaranty Trust Co. of New York, which reviews the loans made by our own country in its wars, from the outbreak of the Revolution to the end of the Spanish war; deals with the general subject of loans in connection with the present war in Europe; and discusses our lessons of the past and economic opportunities of the future. Our phenomenal gain in export trade and resulting increase in financial strength is detailed, and the plain obligation imposed upon us in holding 30 per cent of the world's total supply of gold is pointed out. It is conclusively shown that "a lending policy on our part would not only prove a species of protective insurance, but in effect would remove us from the debtor nation class to which we have heretofore belonged and might raise us to the very pinnacle among creditor nations—a class whose commercial prosperity is assured

and whose foreign trade relations are most permanently established."

* * *

The American Asiatic Association is sending out its monthly magazine under a new title, "Asia," and in a new and very attractive shape. The number for March consists of 80 quarto pages, finely illustrated, containing articles of value to those interested in the Far Eastern trade. The present number is devoted almost entirely to China and Japan, though there is also an able article on the Philippines by Manuel L. Quezon, former resident commissioner of the Philippine Islands and now president of the senate of the first Philippine Congress.

* * *

The Diamond Power Specialty Co., Detroit, Michigan, sends us a finely printed pamphlet entitled "Increasing Today's Profits," exploiting the soot blower manufactured by that company. It contains some interesting matter as regards the saving of heat and power by elimination of soot deposit, and explains how this deposit acts as a heat insulator. Illustrations of factories where this system is in use, diagrams, recording charts, and ledger sheets are reproduced to prove the claims set forth in the booklet.

* * *

John Burnham & Co., 115 Broadway, New York City, have compiled for free distribution a statistical card which will be of interest to holders of motor and rubber stocks. It includes capitalization, par value, present bid and asked markets, dividend rate and date of payment, percentage earned, high and low prices for 1916 and the production of the year in number of cars or gross sales of the leading automobile, automobile accessory and rubber companies.

* * *

According to the latest census of motor vehicles in Great Britain, the total number of automobiles and trucks in actual service is 171,007, about 5 per cent of the number registered in the United States on January 1, 1917, which was 3,541,738. In each of the seven states of New York, Ohio, Pennsylvania, Illinois, California, Texas and Iowa, there are more automobiles and trucks than in all of Great Britain. In the United States the production of cars for 1916 was well over 1,600,000.

* * *

A recent number of "Class," a journal devoted to trade and class journal advertising, has an interesting article by Julius S. Holl, advertising manager of the Link-Belt Co., Chicago, Illinois, which might well be read and even re-read by all who have charge of the advertising and sales departments of large or small industries. It is a sort of confidential talk based on the writer's experience over a wide field, and a profitable expenditure of hundreds of thousands of dollars in trade journals.

* * *

The "Charlotte (North Carolina) News" has published an issue of 88 pages, devoted almost entirely to descriptions of the many textile mills in that state. Each plant is treated individually, pictures and text giving a very complete and comprehensive review of the cotton mill industry. The work was done by an independent investigator, a trained newspaper man, and one of the main objects, evidently, is to rectify some of the impressions caused by sensational reports of the conditions of the mill-workers of the South. The paper is a credit to the enterprise of this daily publication, and is one which shows the prosperity and extent of the cotton weaving industry of the "Old North State."

* * *

The Underwriters' Laboratories "Electrical Data" gives a brief review of the institution, and the work carried on in 1916. Following this are described in detail fires and accidents reported due to electrical causes, with results of investigations. Illustrations of some of these accidents, also views of the laboratories are shown.

THE RUBBER ASSOCIATION OF AMERICA, INC.

AT a special meeting of firm members of the Association held March 7, 1917, the following amendments to the constitution and by-laws were adopted:

Amend Article VI, Section 2, by adding to the first paragraph the words "on which all persons connected with firm members in an official or executive capacity are eligible for appointment, unless otherwise provided."

Amend Article VI, Section 2, sub-division (a) by striking out the words "firm representatives," and substituting therefor the word "members."

Amend Article VI, Section 2, sub-division (b) by striking out the words "firm representatives," and substituting therefor the word "members."

Amend Article VI, Section 2, sub-division (c) by striking out the words "firm representatives," and substituting therefor the word "members."

Amend Article VI, Section 2, sub-division (d) (see our circular letter of December 22, 1916) by striking out the words "by them selected, or" in the fourth line of the third paragraph; by striking out the word "their" in the seventh line of the third paragraph and substituting therefor the words "the disputants"; by inserting the words "named in the said List of Official Arbitrators" after the words "Any two persons" in the fifth paragraph; by striking out the words "said List of Official Arbitrators" in the second line of the fifth paragraph and substituting therefor the words "the same source"; by striking out the word "arbitrators" in the same paragraph and substituting therefor the word "umpire."

Amend Article VI, Section 2, sub-division (d) by striking out the sixth paragraph entirely.

Amend Article VI, Section 2, sub-division (e) by striking out the words "either firm representatives or."

Amend Article VI, Section 2, sub-division (f) by striking out the words "either firm representatives or."

These amendments cause the entire Section 2 of Article VI to read as follows:

Section 2. Standing Committees. The Board of Directors or the Executive Committee shall annually appoint the following Standing Committees on which all persons connected with firm members in an official or executive capacity are eligible for appointment, unless otherwise provided:

(a) A Committee on Nominations, to consist of five members, who shall prepare and send to each "Firm Member" at least 30 days before the annual meeting a list of persons nominated by them for directors to be voted upon at the annual meeting; but any other members eligible to hold office, as provided in Article III hereof, may be nominated for election at the annual meeting, provided a written request therefor is received from 20 members and is in the hands of the Secretary in time to be sent to each "Firm Member" at least 15 days before the date of the annual meeting.

(b) Auditing Committee to consist of two members, who shall annually audit the accounts of the Treasurer.

(c) Committee on Legislation to consist of three members, who shall keep in touch with local, State and Federal legislation affecting the rubber industry; to secure copies of bills and report thereon to the Executive Committee or the Board of Directors whenever in its opinion it may deem necessary.

(d) A committee on arbitration to consist of seven members, four of whom shall be manufacturers and three crude rubber importers or brokers. The chairman of such committee shall be chosen by the members from their own number for a term of three years, and the term of each of the additional members shall be three years, except that at the time when this Committee shall be originally appointed the six members then appointed, other than the chairman, shall decide by lot which of their number shall serve for periods of one, two and three years, respectively, two members of the Committee being assigned to each class, and that thereafter two members shall be appointed by the Board of Directors or by the Executive Committee in each year. If any vacancies should occur in this Committee, such vacancies may be fulfilled by the Board of Directors or by the Executive Committee at any regular or special meeting.

DUTIES.—This Committee shall have complete supervision in respect to all matters for arbitration referred to The Rubber Association of America, Inc., and shall make rules and regulations for the conduct and disposition of all matters

submitted to arbitration subject to the approval of the Board of Directors or of the Executive Committee. It shall provide a form of agreement not inconsistent with existing provisions of law, which, so far as practicable, the decisions of the arbitrator or arbitrators shall be as effective as judgments of the Supreme Court of the State of New York. It shall compile and from time to time revise and keep a list of qualified persons, not less than 25, willing to act as arbitrators under these rules, and who shall be members of The Rubber Association of America, Inc. This list shall be known as "The List of Official Arbitrators of The Rubber Association of America, Inc."

Any matter in controversy may be referred to arbitration by the disputants signing the form of agreement provided by the Committee, together with a stipulation to the effect that they will abide by the decision of the arbitrator or arbitrators, selected by the Arbitration Committee, and waiving any and all rights to withdraw from such submission after the acceptance of their appointment by the arbitrator or arbitrators selected, and designating at the disputants' selection of either of the two following options:

(1) One of the persons named in said List of Official Arbitrators, who shall act as sole arbitrator; or

(2) Any two persons named in the said List of Official Arbitrators to act as arbitrators, who in turn shall designate from the same source a third person to be associated with them as umpire.

The Committee on Arbitration shall, from time to time, establish a schedule of moderate fees to be paid in all matters submitted, which fee shall be chargeable as decided by the arbitrators.

The Secretary of The Rubber Association of America, Inc., shall be the Clerk of the Committee on Arbitration.

(e) A Banquet Committee, to consist of three members, who may be Associate Members.

(f) An Outing Committee, to consist of three members, who may be Associate Members.

CHANGE IN THE BRITISH RUBBER GUARANTEE.

The British Government has slightly altered the rubber importers' guarantee by substituting the words "sell or deliver" for the word "sell," in the seventh line of the second paragraph. This change has been made necessary because of rubber having been consigned to New York firms as "bailees," without their knowledge or consent.

DIVISION MEETINGS.

The Rubber & Fibre Sole Division met at the Association rooms, March 9; W. H. Yule of The B. F. Goodrich Co., Akron, Ohio, presided. A good attendance and a very satisfactory meeting was reported.

The Rubber Reclaimers Division held a meeting in the Association rooms March 13. In the absence of Francis H. Appleton, Clark W. Harrison, Bloomingdale Rubber Co., New York City, presided. Matters pertaining to extension of the division's activities were discussed and committees appointed.

EXPORT TRADE DIVISION FORMED.

At a recent meeting of the Board of Directors it was voted to extend to the member manufacturers the opportunity of organizing an Export or Foreign Trade Division similar in scope and intent to the other trade divisions of the Association already in existence. Pursuant to this vote a meeting was held in the Association rooms March 21. There were 25 export managers present and W. V. Logan, of the McGraw Tire & Rubber Co., was elected chairman. The following Committee on Nominations was appointed: John Macfadyean, chairman, Good-year Tire & Rubber Co., New York City; C. O. Brandes, Firestone Tire & Rubber Co., Akron, Ohio; Henry G. Tyer, Tyer Rubber Co., Andover, Massachusetts. The Committee on By-Laws follows: D. H. Broadwell, chairman, The Fisk Rubber Co., Chicopee Falls, Massachusetts; C. E. Wagner, Miller Rubber Co., Akron, Ohio; E. H. Huxley, United States Rubber Export Co., Limited, New York City; G. C. Chalmers, Hodgman Rubber Co., Tuckahoe, New York; A. S. Hardy, Manhattan Rubber Manufacturing Co., New York City.

The Obituary Record.

HEAD OF A GREAT WIRE CONCERN.

FERDINAND W. ROEBLING, treasurer and general manager of the John A. Roebling's Sons Co., Trenton and Roebling, New Jersey, died at his home in the former city March 16, aged 75 years.

Mr. Roebling was born February 27, 1842, at Saxonburgh, Pennsylvania, where his father, John A. Roebling, established the first wire rope mill in the United States. Six years later, this business was removed to Trenton, and the family has resided there ever since. Ferdinand W. Roebling graduated from the Polytechnic College and immediately became associated with his father, becoming later treasurer and general manager of

F. W. ROEBLING.

the company, which under his direction he saw grow from small beginnings to one of the important industries of this country, employing 7,000 hands.

Foreseeing the importance of electrical progress, he developed the insulated wire and cable branch of the business to its present proportions, and cables made by this concern carry messages under every ocean on the globe.

But Mr. Roebling was also actively identified with a number of other industries. He was treasurer of the New Jersey Wire Cloth Co., president of the Union Mills Paper Manufacturing Co., vice-president of the Syracuse, Rochester and Eastern Railway Co., director of the Mechanics National Bank of Trenton, of the National Copper Bank of New York, of the Merchants and Metals National Bank of New York, of the Mercer Automobile Co., of the Otis Elevator Co., of the Trenton Street Railway Co., of the Interstate Railways Co., of the Trenton Brass and Machine Co., of the Standard Fire Insurance Co., of Trenton. Mr. Roebling's influence in the world of finance was nationally recognized. Several years ago he was selected as a director of the Equitable Life Assurance Society.

Mr. Roebling, though politically influential, never sought public office. He was a delegate to several Republican National Conventions, but he held no important office except as president of the Trenton Free Public Library, and as a member of the commission which built the Trenton City Hall. It was through Mr. Roebling's influence that the Free Public Library was instituted and built, and his interest in that institution continued up to the time of his death.

He had many hobbies. He was an enthusiastic hunter and fisherman. He won many prizes as a marksman. He was fond of automobiling. He conducted a chicken farm, and later interested himself in raising blooded cattle. He was one of the moving spirits in organizing the Trenton Country Club.

He was a man of strong likes and dislikes. His predominant characteristics were reserve and energy. He was a deep thinker and a man of few words. He loved companionship of

those in whom he was interested. He had decidedly individualistic ideas about all things, and he applied this trait in many striking ways. He used his wealth freely for the advancement of causes which appealed to him, but while some of his charities are known, he helped many causes, while enjoining secrecy.

Mr. Roebling was a member of the Union League of Philadelphia, the Engineers' Club of New York, the Lotus Club, the Trenton Country Club and of the Carteret Club of Trenton.

He is survived by two sons and two daughters, also by his mother, three brothers and one sister. His wife died several years ago.

KNOWN IN THE RUBBER STAMP TRADE.

Mrs. Margery S. Stewart, president and treasurer of R. A. Stewart & Co., Inc., New York City, dealers in hand stamp supplies, and president of the Hill-Independent Manufacturing Co., of Philadelphia, Pennsylvania, died in the latter city, after a long illness, March 6. She was born in New York City in 1863, was a graduate of Hunter College, and had been connected with the stamp trade as far back as 1881, and actively engaged in the business since 1900. She was an able business woman, personally directing the concerns with which she was connected, and besides this, was actively engaged in practical philanthropic work, in which she made many friends who deplore her loss.

FORMERLY IN THE RUBBER TRADE.

William Dwight Shattuck died at Boston, Massachusetts, March 19, aged 55 years. He was born in Roxbury, now a part of Boston, and for a number of years was connected with the boot and shoe business there and in Newburyport. Later, for a number of years, he was with Parker, Stearns & Co., manufacturers of druggists' and surgical sundries, Brooklyn, New York, leaving their employ about four years ago to locate at Spofford, New Hampshire, to superintend the interests of E. Ward Stearns, of the above named firm, who owns a hotel at that place. Mr. Shattuck was a member of several Masonic bodies. He is survived by a sister. Interment was at Spofford, New Hampshire.

FORMERLY A RUBBER STAMP MANUFACTURER.

George Moss, for several years a rubber stamp manufacturer in New York City, died at his residence in Brooklyn, New York, March 21, aged 58 years. He was a member of several Masonic bodies, and had attained to the thirty-second degree. He left a widow, three sons and a daughter.

RED OXIDE OF IRON COMING FROM SPAIN.

Notwithstanding the great production of red oxide of iron in the Marquette region of Lake Superior, so heavy has been the demand that a steady increase is noted in imports of this mineral pigment from Spain. The beginning of this movement was a single shipment, in 1901, to the value of \$52.50. In 1905 the figures had grown to \$870, and in 1910 had increased to \$5,186. Since then, shipments have rapidly increased, and in the first nine months of 1916 shipments of this substance to the value of \$55,588 had been made, and a far greater record would have been shown for the year had there been normal shipping accommodation.

This enormously increased demand is caused by its being substituted for red oxide of lead, not only for paint manufacture but also in many industries. Red lead is quoted at about \$350 a metric ton, while Spanish red oxide of iron is sold around \$27 per metric ton. Malaga is the principal port of export.

Interesting Letters from Our Readers.

RUBBER PACKING SUGGESTIONS FROM AN EXPERT.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I read with great interest in your issue of January 1, 1917, the advice given by The Rubber Club of America, Inc., about plantation rubber packing, and I am quite sure that the suggestions will be useful. Of course it stands to reason that the suggestions made by the manufacturers deal only with the manufacturing side of the question, and it will be impossible for many growers to deal with some of them in a practical way.

Allow me to give you my views on the subject.

No. 1. Experience has proved that in the tropics neither paper, cloth, straw nor dry leaves should be placed inside a package to contain crude rubber, either wild or plantation. Therefore, I cannot agree with suggestion No. 2, viz., that rubber should be packed in muslin. It is suggested in No. 3 that boxes should be made to hold 200 to 300 pounds. It is quite impossible to ask rubber growers to make a general rule of this; it is a question of transport. The best weight to adopt is what the average adult coolie can handle somewhat by himself. On the other hand, too much rubber in a parcel brings a pressure on the stuff, which for some grades is not at all beneficial. The size adopted by the Venesta chest is practical, and meets most of the requirements. It is both light and very strong.

In No. 17 I notice that some species of tropical woods are suggested. I am of the opinion that some of our tropical woods are of a too hard and breakable character.

No. 21 is very good advice indeed, viz., "store away from the boiler," but I should add "*and the sun.*"

Talc or soapstone should be freely used in chests when placing the rubber inside.

The great enemies of crude rubber, either plantation or wild, are: The tropical sun, a bad warehouse, defective packing and bad curing.

G. VAN DEN KERCKHOVE.

London, February 15, 1917.

AMERICAN CAPITAL IN EASTERN PLANTATIONS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Like the United States, as recounted in THE adverse views expressed through the columns of newspapers here on the so-called "American invasion" in the field of rubber production in the Malay Peninsula. But few, if any, editorials or written opinions I have seen so far have apparently considered what such a vast and permanent improvement as the conversion of thousands of acres of waste jungle lands would be, not to mention the great expenditure of foreign gold this conversion would require. It would be outside foreign capital not earned nor coined in the Far East, but voluntarily expended here in wages and materials; also the extra capital it would take to operate the plantations for all future time, which would mean a large and continual expenditure in payrolls for the employment of labor and upkeep, which, in a measure, would mean continued prosperity.

The sale of the product of the present plantations would not be disturbed, as the demand of factory consumers of the world, and especially in America, keeps apace, indeed, if not in advance of the production. In the interim between planting and maturing the trees to bearing, this locality would have the use of the large sums so expended in the project, which in itself would mean a degree of prosperity.

Do the inhabitants of this most (rubber) favored spot on earth realize how much America has contributed to their prosperity?

Do they realize what is the cause of the American demand for rubber? Are they expressive of appreciation for the unbroken stream of gold flowing from America into their exchequer and thus making many millionaires here?

Let me direct attention to the year 1916. The most accurate figures obtainable at this time show there was probably an excess of 160,000 tons of plantation rubber produced in the Far East, most of it on this peninsula. Seventy per cent, or 112,000 tons, was consumed by America. This is 250,880,000 pounds. It was marketed (conservative estimate) at 60 cents gold "all in" per pound, for which America paid \$150,528,000 gold—over £30,000,000. Is there any thinking citizen opposed to her further contribution and building up in permanent improvement portions of this peninsula, where man-eating tigers and crocodiles now reign supreme?

The cause of the demand for rubber by America is the automobile, where 83 per cent of the world's supply is manufactured. Yet the British Government has passed recently laws so levying taxes against American automobiles as to hamper if not discourage their importation into portions of its dominions and dependencies, and gives as a reason the discouragement of luxurious extravagance of its citizens during war times. I am informed in the dependency of India further importation of American automobiles is prohibited. The result cannot but be a discouragement of America's rubber purchases which the tabooed automobile encourages. Is it not, indeed, an indirect expression of unappreciation of what America has done and is doing for the rubber industry and the Malay Peninsula?

Singapore, January 7, 1917.

JESSE E. LA DOW.

KLINGERIT SUBSTITUTES IN ENGLAND.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Like the United States, as recounted in THE INDIA RUBBER WORLD of March 1, 1917, England and France felt the need of Klingerit high-temperature steam packing soon after the beginning of hostilities in Europe which cut off the source of supply in Austria and Germany. Our asbestos firms had undertaken its production many years ago with considerable success, but none of the rubber works had been able to compete with the imported article. Exactly what success those rubber firms who took up its manufacture two years ago have attained does not yet seem to have become common knowledge. A great difficulty was the analysis, which was difficult and, indeed, by many chemists considered impossible.

A few months ago, however, I was interested to note that M. Dubosc in "*Le Caoutchouc & la Gutta-Percha*" gave the results of an analysis of Klingerit as follows: Asbestos, 80.46 per cent; flax, 2.24 per cent; rubber, 5.19 per cent; balata, 11.97 per cent; sulphur, 0.13 per cent. The rubber and balata form the agglutinant whereby the compound layers of asbestos mixed with flax fibers are held together. The interesting point about this analysis is that rubber and balata figure separately with the meticulous accuracy of the second place of decimals. I do not wish in my ignorance to throw any doubt on the analyst, but I always understood that no method was available by which the balata content of a rubber compound could be accurately determined. When it is known that they occur together—and that they do so in Klingerit is generally understood—it has been possible to give a rough approximation of the amount of each, but Weber's statement that our knowledge does not permit us to separate them is generally accepted, though of course rubber analytical methods have made great advances since Weber's book was written.

A RUBBER STUDENT.

London, March 15, 1917.

News of the American Rubber Trade.

SIXTEEN DIRIGIBLES FOR THE NAVY.

THE Navy Department of the United States Government has ordered 16 dirigible airships for coast and harbor patrol work, at a cost of \$649,250. These are to be of the non-rigid type, 160 feet long, 31½ feet in diameter, or 50 feet high over all, and will be equipped with 100-horsepower motors, capable of making a continuous flight of 16 hours at 35 miles per hour and a maximum speed of 45 miles for 10 hours.

The awards were as follows: Curtis Aeroplane Co., Buffalo, New York, three for a total of \$122,250; Connecticut Aircraft Co., New Haven, Connecticut, two for \$84,000; The B. F. Goodrich Co., Akron, Ohio, two for \$83,000, and The Goodyear Tire & Rubber Co., Akron, Ohio, nine for \$122,250.

HOOD RUBBER CO. REPORT.

Following is the condensed balance sheet of the Hood Rubber Co., Watertown, Massachusetts, dated December 31, 1916:

ASSETS.

Plant (real estate, machinery, etc.)	\$1,900,000.00
Merchandise	1,846,308.71
Accounts receivable	3,381,810.80
Cash	318,180.68
Investments in other corporations	159,400.00
Patents	1,000.00
	\$8,606,700.19

LIABILITIES.

Capital stock—Common	\$2,500,000.00
Preferred	2,750,000.00
	\$5,250,000.00
Notes payable	2,280,000.00
Surplus	1,076,700.19
	\$8,606,700.19

Merchandise in process of importation and letters of credit and drafts discounted in connection therewith are not included in the foregoing statement.

AMERICAN CHEMICAL SOCIETY MEETING.

The general meeting of the American Chemical Society, to be held in Kansas City, Missouri, April 10 to 14, promises to be one of the most interesting in the history of that organization. It will be the first for many years held in that section, where are situated many of the nation's chemical industries, especially those relating to natural gas, petroleum and zinc. There are to be symposiums on these subjects, and important excursions are planned for personal visits and investigations in the fields above mentioned, as well as visits to industrial plants with which chemistry is more or less closely allied. The local committee is headed by W. A. Whitaker, of the University of Kansas, Lawrence, Kansas, chairman of the executive committee.

DOMINION RUBBER SYSTEM CHANGES.

A recent announcement of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, reports the following appointments, effective February 12:

R. E. Jamieson, director in charge of sales of Dominion Rubber System; J. M. S. Carroll, sales manager, Dominion Rubber System; F. A. Todd, general credit manager, Dominion Rubber System; Hugo Wellein, division manager, Quebec division; Geo. Bergeron, assistant division manager, Quebec division; H. R. Nixon (St. John branch) becomes chief clerk to director in charge of sales at head office; and A. R. Hannah, office manager, St. John branch.

The rapid expansion of business in western Canada has made necessary a rearrangement of the Middle West division. Two new divisions have been created, with a result that each prairie province has become a distinct unit:

Alberta Division—Division office, Calgary, Alberta; division manager, A. C. McGiverin; office manager, J. C. Jones.

Saskatchewan Division—Division office, Regina, Saskatchewan;

division manager, L. T. McGiverin; office manager, Frank Garnett.

Manitoba Division—Division office, Winnipeg, Manitoba; in charge of Charles Holden, western sales manager; office manager, J. H. Rice.

ASSOCIATION SPONSORS BRAKE LINING TESTS.

The Asbestos Brake Lining Manufacturers' Association, Ambler, Pennsylvania, organized July 28, 1916, endeavors to aid manufacturers' interests by bettering the service to the trade in general, and is now preparing the way for disinterested testing of all brake band linings. This work will be done by recognized experts, and is expected to demonstrate that brake lining of a certain stipulated construction, quality, etc., is best suited for given requirements. The Society of Automobile Engineers has been invited to cooperate and it is hoped to render a real service to the motoring public at large.

The president of this association is A. H. Burdick, treasurer of the Standard Woven Fabric Co., Walpole, Massachusetts, and the secretary-treasurer is C. J. Stover, vice-president of Keasbey & Mattison Co., Ambler, Pennsylvania.

RUBBER COMPANY'S DIVIDENDS.

The Goodyear Tire & Rubber Co. paid its usual quarterly dividend of 3 per cent on the common stock on March 1.

The New Jersey Zinc Co. paid an extra 4 per cent dividend on March 10.

The Fisk Rubber Co. paid a quarterly dividend of 1¾ per cent on second preferred stock on March 15 to stockholders of record January 31.

The Ajax Rubber Co., Inc., paid a quarterly dividend of \$1.25 on March 15 to stockholders of record February 28.

The Pennsylvania Rubber Co. has declared a quarterly dividend of 1½ per cent on common and 1¾ per cent on preferred stock, payable March 31 to stockholders of record March 15.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of \$1.50 per share on preferred stock, payable April 2 to stockholders of record March 17.

The Rubber Goods Manufacturing Co. paid a quarterly dividend of 1¾ per cent on preferred stock on March 15 to stockholders of record March 10.

The board of directors of the Keystone Tire & Rubber Co. has declared a quarterly dividend of 2 per cent with an additional ⅓ per cent upon preferred stock and a regular quarterly dividend of 3 per cent on common stock, payable April 2 to stockholders of record March 23.

The Federal Rubber Co. has declared a quarterly dividend of 1¾ per cent on first preferred stock, payable April 1 to stockholders of record March 17.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on March 26 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle Street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	67	69
Firestone Tire & Rubber Co., common	141	143½
Firestone Tire & Rubber Co., preferred	107	109
The B. F. Goodrich Co., common	8	56
The B. F. Goodrich Co., preferred	108¾	111
Goodyear Tire & Rubber Co., common	50	58
Goodyear Tire & Rubber Co., preferred	106	107
Kelly-Springfield Tire Co., common	63	63½
Kelly-Springfield Tire Co., preferred	93	94
Miller Rubber Co., common	130	210
Miller Rubber Co., preferred	105	106
Portage Rubber Co.	179	182
Swinchatt Tire & Rubber Co.	78½	83
United States Rubber Co., common	59	59½
United States Rubber Co., preferred	118	108½

TRADE NOTES.

The capital stock of the Ohio Rubber Co., Cleveland, Ohio, has been increased from \$300,000 to \$400,000, to care for a growing volume of business. This company also operates branches at Cincinnati, Ohio, and Detroit, Michigan.

The Brighton Mills, manufacturer of cotton and special fabrics, Passaic, New Jersey, has increased its capital stock from \$3,000,000 to \$4,500,000, \$1,500,000 of this increase being in preferred and \$3,000,000 in common stock. The company states that owing to the enhanced value of raw material and finished products, this additional capital is needed to finance the business properly.

The Dryden Rubber Co., Chicago, Illinois, has just completed a large two-story addition of reinforced concrete construction to care for the marked increase in its fiber sole and rubber heel business.

At the recent annual meeting of the I. B. Kleinert Rubber Co., New York City, officers were elected as follows: Victor Guinzburg, president; H. A. Guinzburg, vice-president and treasurer, and A. B. Salinger, secretary.

Alterations and improvements now in progress at the plant of the Chicago Insulated Wire & Manufacturing Co., Sycamore, Illinois, will cost approximately \$75,000, and include many new machines of special designs.

The Dupont Fabrikoid Co., which recently purchased the plant of the Fairfield Rubber Co., Fairfield, Connecticut, is erecting a large addition to that plant. The enlargement is an extensive one, and it is expected that it will not be completed for several months.

The New Jersey Zinc Co., New York City, has elected the following directors: Charles W. Cox, William P. Hardenbergh, August Hecksher, Thomas D. Jones, Edward S. Marston, Edgar Palmer, John J. Riker, Edwin M. Squier and A. B. Schultz.

The United States Rubber Co., New York City, will open two new branches shortly. One, in Manila, Philippine Islands, will be in charge of Charles E. Guest, formerly with the Mexican branch of the business. This new office will handle a portion of the Oriental trade of the company, hitherto under the direction of the San Francisco, California, branch. The other branch, in Australia, will be under the management of J. A. McKenzie.

The Winnsboro Mills, Winnsboro, South Carolina, formed last summer under South Carolina laws to take over the Fairhaven Mill of the Hampden Cotton Mills Co., has changed to a Massachusetts corporation, increasing the capital stock to \$900,000. On February 1 work began on a large addition to the plant, and when this is completed, probably about July 1, the product will be changed from print cloths to novelty tire fabrics. Ten thousand new spindles will be installed, bringing the total up to 35,000. Five hundred looms are now operated, and this number will be increased, although to what extent is not known at this time. J. Pennington Gardiner, 60 Federal street, Boston, Massachusetts is the purchasing agent for the company, which is under the management of Lockwood, Greene & Co.

The board of directors of The Barrett Co., New York City, has voted to increase the capital stock of the company from \$20,000,000 to \$37,500,000, such stock when increased to consist of \$25,000,000 of common stock divided into 250,000 shares and \$12,500,000 of preferred stock divided into 125,000 shares of the par value of \$100 each.

J. Early Wood, Inc., manufacturer and exporter of chemicals, New York City, has taken over the exclusive sales control of the L. & R. Organic Products Co., Inc., of Elizabeth, New Jersey, which manufactures nigrosine. The Wood company's own line includes several shades of spirit, oil and water soluble material in powder and crystals.

The Ravenna Rubber Co., Ravenna, Ohio, has increased its capital stock from \$100,000 to \$250,000. This additional capital is needed to finance the increased volume of business resulting from the company's purchase of the entire druggists' sundries

equipment of The Star Rubber Co. The officers and directors of the Ravenna company are as follows: S. K. Elliott, president and treasurer; R. W. Beebe, secretary; L. A. Ritzman, E. H. Sniffin, K. M. Elliott and M. H. Beebe. An existing vacancy in the directorate will be filled at the next meeting of the company.

The New York City sample room of the Davol Rubber Co., Providence, Rhode Island, has been removed from 299 Broadway to 302 Broadway, where more commodious quarters and better facilities for display are afforded.

The Rubber Waste Co., New York City, will be located temporarily at 247 East One Hundred and Thirty-seventh street, pending the completion of its new office and warehouse at Lincoln avenue and One Hundred and Thirty-fifth street.

The Seamless Rubber Co., New Haven, Connecticut, has been placed in the hands of a receiver, Vernal W. Bates, on an application in which 97 per cent of the creditors joined.

Lockwood, Greene & Co., Boston, Massachusetts, announce the resignation of P. T. Jackson, Jr., as an officer of the Bay State Cotton Corp., Lowell, Massachusetts, and Boston Yarn Co., Boston, Massachusetts, to associate himself with other interests, and the appointment of Allan B. Greenough as treasurer of the Bay State Cotton Corp. and president of the Boston Yarn Co.

The Passaic Cotton Mills, Passaic, New Jersey, has acquired the remaining cotton mills of the New England Cotton Yarn Co., at New Bedford, Massachusetts. They are equipped with 36,000 spindles for the manufacture of tire fabrics. The plant will be operated under the name of the New Bedford Spinning Co., recently incorporated under Massachusetts laws with a capital of \$200,000.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[286.] A correspondent wishes to be placed in touch with manufacturers of a magnetic separating machine for separating rubber from wire.

[287.] A complete estimate is desired of machinery needed for the manufacturing of rubber heels, soles and similar goods, based on using guayule rubber.

[288.] A Japanese company desires to import reclaimed rubber, substitutes, and chemicals for rubber manufacturing; and is also in the market for tire machinery and machinery for proofing fabrics.

[289.] A consumer desires to place an order for red atomizer bulbs.

[290.] Names of makers of golf-ball machinery are requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Switzerland is in the market for india rubber cloth for printers. Report No. 23,870.

A shoe dealer in Spain wishes to purchase rubber soles and heels. Report No. 23,878.

Representation of American manufacturers and exporters of druggists' sundries is sought by a firm in Colombia. Report No. 23,971.

Catalogs and full information from American manufacturers of rubber raincoats are desired by a firm in Java. Report No. 24,003.

An agency is desired in Spain for boxes of rubber type, rubber stamps, etc. Report No. 24,040.

An applicant in the West Indies desires to be placed in communication with American manufacturers of elastic webbing. Report No. 24,043.

PERSONAL MENTION.

Charles R. Sargent, formerly connected with Innis, Speiden & Co., has severed his connections with that concern and entered the firm of Stresen-Reuter & Hancock, Inc. The latter company has opened offices and a warehouse at Cleveland, Ohio, where Mr. Sargent will maintain headquarters.

R. J. Parkell, formerly connected with the Hoffman-La Roche Chemical Works, is now associated with the St. George Chemical Co., Inc., 99 John street, New York City, as manager of the chemical department.

Frank A. Mayo, for 18 years manager of the rubber shoe department of Clark-Hutchinson Co., wholesale shoe merchants, Boston, Massachusetts, has tendered his resignation, to become vice-president and treasurer of H. B. Hanford & Co., leather and rubber footwear wholesalers, Philadelphia, Pennsylvania.

W. F. Enright, manager of the Minneapolis branch of the United States Rubber Co., New York City, was a speaker at the first annual convention of the Minnesota Retail Shoe Merchants' Association at Minneapolis last month. J. J. Hawkins, president of the Standard Shoe & Rubber Co., another speaker, gave an interesting talk on the rubber trade and explained the process of manufacture of rubber footwear, exemplifying this process by making a rubber boot before his audience.

Earle Brothers, New York City, announce that Russell W. Earle has become a member of the firm.

F. Y. Horn has been appointed district manager for the Amazon Rubber Co., Akron, Ohio, in the Central West, with headquarters at Chicago, Illinois.

Harry T. Dunn, president of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has resigned his position of vice-president of the Willys-Overland Co., of Toledo, Ohio, to give his attention solely to the tire business of the Fisk company, and of the Federal Rubber Co., of Cudahy, Wisconsin, of which he is also president.

John W. Maguire, for several years Chicago branch manager for the Republic Rubber Co., Youngstown, Ohio, has resigned that position to become general sales manager of the Brunswick-Balke-Collender Co., Chicago, Illinois.

A. W. Senz, manager of the Chicago, Illinois, branch of The Gordon Tire & Rubber Co., has been transferred to the main office of the company at Canton, Ohio, as manager of sales of the tire and tube department, and is succeeded by C. H. Kenyon, late with the Ajax Rubber Co.'s Chicago branch.

A. I. Butler, formerly with the Batavia Rubber Co., Batavia, New York, succeeds W. A. Young, former manager of the New York City branch of The Gordon Tire & Rubber Co. Canton, Ohio.

W. H. Batcheller, president of the Akron Tire Co., Inc., of New York City, has been touring through the South by motor car, spending most of the winter in Florida. He speaks highly of the excellent roads now finished and others being built and resurfaced in that State.

Percy W. Rairden has been appointed sales manager for the Savage Tire Corp., of San Diego, California. Mr. Rairden brings to the Savage company a broad business experience, including first-hand knowledge of conditions in the foreign rubber-producing centers.

MCGRAW COMPANY APPOINTMENTS.

Changes in the personnel of the McGraw Tire & Rubber Co., East Palestine, Ohio, are as follows: R. G. Nelson has been made assistant sales manager, with headquarters at East Palestine. W. V. Logan, former district manager at St. Louis, Missouri, is now district manager of the New York territory, being succeeded in St. Louis by C. E. Pumphrey, former district manager of the Atlanta, Georgia, territory. Former representative, T. J. Harris, succeeds Mr. Pumphrey.

CANADIAN CONSOLIDATED BOND ISSUE.

At a special general meeting of shareholders of Canadian Consolidated Rubber Co., Limited, held at the head office, Montreal, on February 14, the directors were authorized to issue first and refunding mortgage gold bonds to the amount of \$8,000,000. This issue is to retire debentures amounting to \$2,500,000, which fall due in 1918, to liquidate bank advances and to provide funds for further expansion of business.

The Canadian Consolidated Rubber Co.'s business has expanded far beyond the ideas entertained when the first financing was carried out in 1906. This expansion necessitated temporary financing measures from time to time. The present issue of bonds consolidates this financing and permits continued growth.

ADDITION TO STANDARD UNDERGROUND CABLE CO.'S PLANT.

The Standard Underground Cable Co. of Canada, Limited, is making an addition to its factory at Hamilton, Ontario, which, when completed and equipped with the necessary machinery, will represent an investment of \$50,000.

The new structure will be devoted exclusively to the uses of the wire drawing department and consists of one story with

basement built of brick and concrete and is 125 by 120 feet in dimensions, which gives a total increase in floor space of 30,000 square feet. It is most modern in type and equipped to secure the lighting, heating and ventilation necessary to the best working conditions. Ample fire protection apparatus is also provided for, which includes a complete automatic sprinkler system.

CROMPTON & KNOWLES ELECTIONS.

At the recent annual meeting of the Crompton & Knowles Loom Works, Worcester, Massachusetts, Charles H. Hutchins retired as president of the concern and Lucius J. Knowles was elected to succeed him.

Other officers and directors elected are: Vice-presidents, Earl E. Howard, Irving H. Verry and Frederic W. Howe; treasurer, Edward F. Green; assistant treasurer, Fred J. Bowen; clerk, Earl E. Howard; general manager, John F. Tinsley; general counsel, Charles M. Thayer.

KELLY-SPRINGFIELD TIRE CO.

The Kelly-Springfield Tire Co., New York City, has purchased the Northland Rubber Co. plant at Buffalo, New York. The Kelly-Springfield company is to build at Cumberland, Maryland, but the purchase of the Buffalo plant will enable an immediate increase in production for the present season, pending the completion of the Cumberland plant.

At the annual meeting of the company held on March 13, at 15 Exchange place, Jersey City, New Jersey, directors were re-elected as follows: Van H. Cartmell, Stephen Peabody, Arnold L. Scheur, Jacob Oppenheim, Gustavus Maas, Austin M. Poole, Frederick A. Seaman, and Otis R. Cook.

NEW INCORPORATIONS.

American Tire Filler Co., January 11 (Washington), \$300,000. W. J. Michelet (president), Portland, Oregon; Fred Watson (vice-president), Tacoma; R. S. Wicks (secretary and treasurer), Mt. Vernon—both in Washington. Principal office, Mt. Vernon, Washington. To manufacture tire fillers, tires and accessories.

Appleton, F. H. & Son, Inc., March 3 (Massachusetts), \$400,000. Francis H. Appleton, Francis H. Appleton, Jr., and Frank Tent—all of 185 Summer street, Boston, Massachusetts. Rubber reclaiming, and to manufacture and deal in rubber and rubber compounds, substitutes and products, including boots, shoes and rubber goods.

Automatic Eraser Co., Inc., March 20 (New York), \$10,000. Edward Lewers, Edward N. Walter and Dewitt C. Moore—all of 29 Broadway, New York City. To deal in office supplies.

Blackstone Tire & Rubber Co., Inc., March 13 (New York), \$3,000. Walter Loewenthal, 35 Nassau street, New York City, and C. A. Weldon, 591 Seventh street, and H. H. Jacobson, 555 Grand street—both in Brooklyn, New York.

C. A. Breitenstein Tire Corporation, March 1 (New York), \$55,000. C. A. Breitenstein, M. R. Breitenstein, F. H. Robbins—all of 528 Greene avenue, Brooklyn, New York.

Cleveland Standard Tire & Rubber Supply Co., February 14 (Pennsylvania), \$10,000. John C. Sinn, Pittsburgh, and George R. Mailey and Myles McConnon, Homestead—both in Pennsylvania. Principal office, Pittsburgh, Pennsylvania. To manufacture and deal in automobiles, accessories, etc.

The Colonial Rubber Co., February 20 (Massachusetts), \$25,000. John J. Conway, 503 Huron avenue, Cambridge, and Charles B. Hamilton and Elsie O. Hamilton, 56 East Walnut street, Taunton—both in Massachusetts. To manufacture rubber heels and soles, chemicals and footwear, and to do and deal in rubber reclaiming.

Commonwealth Tire Corporation of America, March 14 (Delaware), \$2,500,000. Martin E. Smith, T. Morley Smith and Artemas Smith—all of Wilmington, Delaware. Principal office Wilmington, Delaware. To manufacture master aluminum automobile tires.

Curtis Tire Co., Inc., March 21 (New York), \$10,000. Harry E. Loveless, Harry Whittaker and Syd Elin—all of 354 Amsterdam avenue, New York City.

Errickson-Priddy Tire Co., February 12 (Oklahoma), \$12,000. C. A. Errickson, S. E. Priddy, J. S. Twombly and J. E. Errickson—all of Ardmore, Oklahoma. Principal office, Ardmore, Oklahoma. To deal in automobile accessories and to conduct an automobile repair shop, etc.

Insulation Development Corporation, March 14 (New York), \$5,000. Edward Rose, Eugene Lawler and Martin Dillon—all of 2 Broadway, New York City. Wire insulating, etc.

Kipp Inner Tube Repair, Inc., February 27 (New York), \$25,000. B. F. Klass, 523 West One Hundred and Fifty-second street; G. J. Heyson, 227 West One Hundred and Eighteenth street, and N. J. Jewel, 250 Manhattan avenue—all in New York City.

A. H. Langford, Inc., March 9 (New York), \$10,000. A. H. Langford, 8 Centre avenue, New Rochelle, New York. F. J. Farnell, Providence, Rhode Island, and B. C. Elliott, 1400 Broadway, New York City. Principal office, New Rochelle, New York. To manufacture rubber tires, etc.

Leader Tire & Rubber Co., Inc., February 27 (New York), \$5,000. Sydney Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 Seventh street, and H. H. Jacobson, 555 Grand street—both in Brooklyn, New York. Repairs, etc.

Life Preserver Suit Co., Inc., March 5 (New York), \$1,000,000. Louis S. Bruenn, 254 West Seventy-sixth street; Ladislaus Von Keviczky, 256 West Ninety-seventh street, and A. E. Puckrin, 175 Claremont avenue—all in New York City. To manufacture life-saving suits and apparatus.

Pacific Rubber Co., January 22 (California), \$50,000. John Hauerwaas, E. C. Austin, W. H. Preston, L. S. Rounsaville and Roy R. Meads—all of Los Angeles, California. Principal office, 433-5 West Pico street, Los Angeles, California. To deal in automobile tires and accessories.

Para Rubber Products Co., February 27 (New Jersey), \$30,000. Frederic W. Rogers and Edward C. Goldfarb, 40 Exchange Place, and H. H. Waller, 140 Nassau street—both in Manhattan Borough, New York City. Principal office, 70 Washington street, Bloomfield, New Jersey. To manufacture and deal in rubber goods.

Paraloid Works, Inc., March 22 (New York), \$80,000. Hugo L. Schneider, Hastings-on-Hudson, New York; Frederic C. Pitcher and Samuel L. Jackson—both of 111 Broadway, New York City. To manufacture rubber, etc.

Paramount Puncture-Proof Tire Co., Inc., March 6 (New York), \$100,000. H. Levy and M. P. Hartman, 37 Liberty street, and S. Kraft, 30 Church street, both in New York City.

Powhatan Metal, Iron and Rubber Co., Inc., March 8 (New York), \$1,000. Louis Milansky, Samuel Milansky and Philip Milansky—all of 199 East Third street, New York City. To deal in junk.

Quick Tire Service, Inc., March 19 (New York), \$10,000. Russell Goldman, 1190 Madison avenue; A. G. Thaanum, 112 Haven avenue—both in New York City, and A. Foshay, 49 Pulaski street, Brooklyn, New York. Tire repair and sales station.

Reliable Tire and Repair Co., The, March 1 (Ohio), \$15,000. F. A. Kline, G. F. Kline, Charles Selby, I. L. Holderman and Lester Selby—all of Dayton, Ohio. Principal office, 305 West Third street, Dayton, Ohio. Tires, tubes and accessories.

Ronback, Walter A., Co., Inc., March 15 (New York), \$5,000. P. W. Smith, 2103 Ocean avenue; Walter A. Ronback, 1657 East Eighth street—both of Brooklyn, New York, and Harry S. Jaeger, Patchogue, New York. To manufacture tires, autos, supplies, etc.

Rubber City Clearing House Co., The, February 7 (Ohio), \$100,000. A. H. Noah (president), C. E. Wilcox (vice-president), R. H. Noah (secretary and treasurer), and C. E. Williams (general manager). Principal office, 1033-1035 South High street, Akron, Ohio. To deal in tires.

Rubber Goods Manufacturing Co., February 10 (Illinois), \$50,000,000. E. S. Williams (president), 524 Fifth avenue; Samuel Norris (secretary), 45 East Sixty-first street, New York City. Principal office, 112 West Adams street, Chicago, Illinois. To deal in rubber products of all kinds.

Security Tube Co., of New Jersey, The, March 14 (New Jersey), \$50,000. James F. Lynch, Joseph Immerman and Eliot Norton—all of 2 Rector street, New York City. Principal office, 14 Chestnut street, Rutherford, New Jersey. To deal in automobile accessories, including tires and tubes of all kinds and description.

Smith, Howard B., Inc., March 19 (New York), \$50,000. J. A. Van Arsdale, 22 Soldiers Place; W. F. Hofheins, 585 Breckinridge street, and Allen Keeney, 33 Franklin street—all of Buffalo, New York. To deal in tires and rubber goods.

Temple Tire & Supply Co., Inc., February 14 (Pennsylvania), \$50,000. John H. Risbeck (president), James D. Pasho (vice-president), John H. Giles (secretary), C. L. Barnett (treasurer)—all of Pittsburgh, Pennsylvania. Principal office, 628 Penn avenue, Pittsburgh, Pennsylvania. To manufacture and deal in automobile tires, accessories, etc.

Vernon Tire & Rubber Co., Inc., The, March 12 (New York), \$25,000. Arthur M. Gross (secretary), 22 Wilson Place; Louis Silverstein, 18 Wilson Place, and Edward A. Partch, 515 South Seventh avenue—all of Mount Vernon, New York. Principal office, Ninth avenue and Sixth street, Mount Vernon, New York. To manufacture tires, rubber soles and heels, etc.

TRADE NOTES.

The Mansfield Tire & Rubber Co., Mansfield, Ohio, has raised its capital stock from \$200,000 common and \$100,000 preferred to \$800,000 common and \$450,000 preferred, of which all the common stock and \$200,000 of the preferred has been subscribed for and paid in, this additional capital providing for the increased demands for Mansfield tires.

A new concern in Fort Worth, Texas, is the Texas Tire & Rubber Co., formed for the purpose of doing a general automobile tire business. This company also operates a Goodyear service station. John Edward Gill is the manager.

The Cupples Co., formerly Samuel Cupples Woodenware Co., St. Louis, Missouri, is manufacturing a rubber tire with a rough safety tread of reversed and staggered C's; also the Rhinos patented inner tube which is made in fairly heavy thickness with fabric insert and is molded and cured in the exact size and exact form of the inside of the casing for which it is intended. This company produces about 400 tires and tubes a day and plans are now under way for doubling this production.

The Lee Tire & Rubber Corp., Conshohocken, Pennsylvania, is now making double the number of tires it turned out last year at this time. January's output was reported as 18,000 tires, February, 26,000, and in March the production was estimated to aggregate 30,000 tires.

The Triple Airless Tire Co., Butler, Pennsylvania, has increased its capital stock from \$50,000 to \$150,000, this increase to include the United States, France, Germany, Great Britain and Canada patents.

The Boone Tire & Rubber Co. is establishing a plant at Chipewewa Falls, Wisconsin, for the manufacture of approximately 200 casings and 200 tubes per day. Five 7-platen presses will also be installed for the manufacture of rubber soles and heels, together with a 5-ton capacity reclaiming plant. A portion of this equipment has already been ordered.

Attorney H. C. Kochler has been appointed receiver for the Alliance Rubber Co. and the Alliance Tire & Rubber Co., of Alliance, Ohio. The property will not be operated under the receivership, but will be appraised with the assets of the company, and as soon as an order of the court can be obtained the property and plant as a whole will be sold. The Alliance Rubber Co. was organized in March, 1913, and in 1916 a reincorporation was effected, with an increase in capital from \$58,000 to \$2,500,000, and the name changed to that of the Alliance Tire & Rubber Co.

The Peerless Tire & Rubber Co., Portland, Oregon, has been formed as a tire distributor and also maintains a well-equipped tire repair shop. Albert Courts is sole owner of the company.

The Marathon Tire Co. is owned by Clark C. Wortley, who is opening up a jobbing business in "Marathon" tires for the State of Iowa, with headquarters at Des Moines. Mr. Wortley expects shortly to open up branch retail stores in all the large cities in Iowa and will also sell to dealers.

The Reliable Tire & Repair Co., Dayton, Ohio, notice of whose incorporation appears elsewhere in this issue, will erect a new building in the automobile district of Dayton, 125 feet long, 39 feet wide and two stories high, with every facility for carrying on its business along the most modern lines. Fred A. Kline is secretary and general manager of the company.

The newly reorganized Dreadnaught Tire & Rubber Co., of Baltimore, Maryland, is making arrangements for a largely increased output of its tires and inner tubes, and has appointed Charles F. U. Kelly to take charge of the sale and distribution. H. Lawton Pettingell will be one of the heads of the sales organization, continuing his association with Mr. Kelly. The new organization is starting out on an aggressive policy. New ma-

chinery and equipment have been provided, capable of doubling the former capacity of the plant, and plans have been formulated for the erection of new buildings to take care of the anticipated increase of business. The headquarters of the sales department are 1834 Broadway, New York City.

The Racine Auto Tire Co., Racine, Wisconsin, which has a present output of 300 tires and 350 tubes per day, is now breaking ground for a new factory, the first unit of which will give a capacity of approximately 1,500 tires per day. The site of the new plant is the old Wisconsin-Illinois baseball park, consisting of approximately four acres, which will allow for expansion in output to 5,000 or 6,000 tires a day. The officers of this company are: L. J. Elliott, president; J. H. Wright, vice-president; C. H. Wright, secretary and treasurer.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has opened a new branch and service station at 154 Rayen avenue, Youngstown, Ohio, in charge of A. J. Sharpe.

The Ardmore-Akron Tire & Rubber Co. will be the name of a new rubber manufacturing enterprise to be located at Ardmore, Oklahoma. John C. Harmony will be president and Charles BeSaw, vice-president and general manager. It is reported that Ardmore has guaranteed a bonus of \$75,000 cash and donated a 5-acre tract of land for the erection of the plant. Mr. BeSaw is the president of the BeSaw Rubber Co., of Hartville, Ohio.

A company has been organized at Bangor, Michigan, for the manufacture of a variety of articles from marl, a substitute for hard rubber. The officers of the new company are L. P. Walker, president, and Edwin Hickey, secretary.

The Palmer Rubber Tire Co., St. Joseph, Michigan, is located in the remodeled quarters of the old Truscott Boot Co. The company is said to be backed by Chicago capital.

R. B. Pierce is the new Cleveland, Ohio, manager for the Kelly-Springfield Tire Co. He was formerly connected with the company's Cleveland branch, but has spent the past year at the plant in Akron.

J. E. Lemmon, who has been connected with the Falls Rubber Co., Cuyahoga Falls, Ohio, has recently been appointed manager of the company's branch at Cleveland, Ohio.

The capitalization of the Gordon Tire & Rubber Co., Canton, Ohio, has been increased from \$600,000 to \$1,600,000. The increase was authorized by the stockholders to take care of future expansion.

The Keystone Tire & Rubber Co., New York City, is moving into new quarters in the "Keystone Building," at Broadway and Sixty-second street.

The National Tire & Rubber Co., East Palestine, Ohio, recently purchased by a syndicate of local capitalists prominently identified with the local rubber industry, will be operated without change of name. Rapid expansion of the business is anticipated. The officers of the new corporation are: C. L. Merwin, president; S. L. Warner, vice-president and general manager; R. B. Taggart, treasurer, and E. N. Herrick, secretary.

THE GREAT REPUBLIC TIRE COMPANY.

The Great Republic Tire & Rubber Manufacturing Co., Wilmington, Delaware, notice of whose incorporation appeared in the February issue of THE INDIA RUBBER WORLD, will presently increase its capital to \$2,500,000, \$1,000,000 of 7 per cent preferred stock and an issue of common stock to be offered for sale. The factory location has not been definitely decided upon but will be in Oklahoma or Texas. J. M. Owens, president of the company, owns large rubber interests in Mexico; W. H. Owens, vice-president and general manager, is a thoroughly experienced tire man, and J. L. Walker, secretary and treasurer, is well known as a wholesale dealer in hardware, automobiles, tires and accessories.

H. L. McCLAREN.

H. L. McCLAREN, who has recently been elected vice-president and sales manager of the Ajax Rubber Co., Inc., New York City, is a veteran in the tire business, his record

dating back to the days of Morgan & Wright, with whom he advanced to the position of sales manager for the Middle West, continuing in the same capacity with the United States Tire Co., which absorbed the business of that concern. In 1912 he became vice-president and general manager of the Racine Rubber Co., Racine, Wisconsin, and later, its president. His achievements with that firm induced the financial interests back of the Mitchell-

H. L. McCLAREN.

Lewis Motor Co., Racine, Wisconsin, to elect him president, and in this dual capacity he put the motor company on its feet and sextupled the business of the tire company.

The Ajax Rubber Co., Inc., recently purchased the business of the Racine Rubber Co., and now the products of both companies will be marketed separately under Mr. McLaren's direction. He has resigned his position with the Mitchell-Lewis Motor Co. and will devote his entire energies to the tire business, in which line his record has been a continuous and striking success.

THE FISK RUBBER CO. REPORT.

At the recent annual meeting of The Fisk Rubber Co., Chicopee Falls, Massachusetts, the following officers and directors were elected, all being reelected except J. D. Anderson, who is a new addition to the board of directors: H. T. Dunn, president; H. G. Fisk, treasurer and clerk; E. H. Broadwell, G. A. Ludington, vice-presidents; R. B. McGaw, assistant treasurer; E. M. Borgardus, comptroller. Directors: H. T. Dunn, Toledo, Ohio; E. H. Broadwell, Longmeadow, Massachusetts; Stedman Buttrick, Boston, Massachusetts; J. D. Anderson, H. G. Fisk, G. A. Ludington, Fred T. Lev—all of Springfield, Massachusetts.

Following is the company's profit and loss report and statement of assets and liabilities for the fiscal year ending December 31, 1916. The total sales for the fiscal year were given as \$19,457,788.77.

ASSETS	
Cash	\$1,112,806.69
Accounts receivable	1,112,806.69
Inventory	1,112,806.69

J. & D. TIRE & RUBBER CO.

At the annual meeting of the J. & D. Tire & Rubber Co., Charlotte, North Carolina, held March 1, the following officers were reelected: H. O. Smith, president; Thos. J. Northway, vice-president; C. C. Coddington, treasurer, and Lee A. Folger, secretary. These, together with H. S. Leyman, W. G. Welbon, John L. Dabbs, and E. Thomson, constitute the board of directors.

The company's new plant just completed consists of three buildings of concrete and glass construction, two main buildings, with the mill room in a one-story structure in the center. The arrangement is such that additional buildings and equipment may be developed up to a capacity of 2,000 tires per day without any rearrangement of the present plant. The machinery is electrically driven, the vast hydro-electric power sources of that section making electric power inexpensive. Boilers of 250-horse-power are used for heating and vulcanizing. The machinery is new and modern in every particular, and the company expects to develop a very large business under the management of the officers and superintendent, several of whom have had long practical experience in the tire business.

Annual Report of the United States Rubber Co.

THE annual report of President Samuel P. Colt, of the United States Rubber Co., which was sent to the stockholders early last month, is even better than the preliminary report furnished earlier, at the time of the \$60,000,000 bond financing.

The net sales of \$126,759,129 are \$1,759,000 larger than the preliminary estimates, and the balance of net profits for interest on funded debt of \$13,495,155 is practically \$1,000,000 better than the preliminary estimate of a balance of at least \$12,500,000.

As a matter of fact, net sales for 1916 gained \$33,898,113, or 36.5 per cent, over the previous year. The balance for interest (including floating debt) and dividends of \$14,743,774 was \$3,257,070, or 28 per cent, in excess of the corresponding figures for 1915.

It will be noted that while the sales and profits were both greater than in any previous year the percentage of profits to sales was less than in the previous year, and, therefore, the changes in prices inaugurated early this year were justified.

With the simplification of organization will come economies in administration, and the funding of indebtedness will further reduce actual running expenses. Already the company has begun the liquidation of subsidiary companies through absorption by the parent organization.

The increase in the tire business is worthy of special mention, being nearly 60 per cent larger than that of 1915.

Evidently the Sumatra plantations are proving a valuable asset of the company. The expert business shows a gain, but only a small one.

The reports of the president and the treasurer follow:

THE PRESIDENT'S REPORT.

To the Stockholders of the United States Rubber Co.:

The by-laws of the company provide that the president "shall make a report in writing to the stockholders at their annual meeting, reviewing the general business and condition of the company." In compliance therewith, your president submits the following report for the fiscal year ending December 31, 1916.

The treasurer's report, which is hereto appended and made part hereof, gives the consolidated general balance sheet as of December 31, 1916, and the consolidated income statement for the year ended December 31, 1916, of the United States Rubber Co. and all its subsidiary companies.

FUNDING OF COMPANY'S INDEBTEDNESS.

The most important event of the year has been the funding of the indebtedness of the company and its subsidiaries through the banking house of Messrs. Kuhn, Loeb & Co. Negotiations to this end were begun some months ago and but recently consummated. Through the sale of \$60,000,000 first and refunding mortgage 5 per cent bonds, the company is now provided with funds wherewith to pay its entire debt and the debts of its subsidiary companies, with the exception of \$9,000,000 General Rubber Co. debentures due December 1, 1918, and \$2,600,000 Canadian company bonds due October 1, 1946. In addition to the payment of the indebtedness, further working capital is also provided. The bonds of the Canadian company are not being retired at present through the refunding, inasmuch as they do not mature for nearly 30 years; and the debentures of the General Rubber Co. are also left undisturbed for the present, as the company has under consideration other plans for dealing with its important crude rubber interests. Provision, however, is made for the issue of additional bonds up to the amount of the capital stock of the company at any time outstanding (at the time of the authorization \$97,252,900) to take care of the above named bonded obligations, should it hereafter be found desirable to do so; and, under conservative restrictions, to provide also for the future growth of the company.

This funding has been carried out in a most thorough manner; and, while the bankers have been exacting in their requirements where the security of the bond was involved, they have at the same time shown a breadth and a spirit of fairness in the

whole transaction and a desire to have the company unhampered in the economic administration of its business, which cannot be too strongly commended.

To authorize the transaction, our stockholders responded to the call for proxies with a unanimity most gratifying to your directors and president, and which I wish to take this opportunity to acknowledge. More than three-quarters of each class of stock (the percentage of the whole being over 82 per cent) voted in favor of the transaction and no shares voted against it.

SIMPLIFYING OUR ORGANIZATION.

With the funding of our debt, we will be able to simplify our organization and thereby bring about economies in administration in several ways, among which will be the liquidation of companies whose separate organization is now unnecessary. Steps to this end will be promptly taken.

VOLUME OF BUSINESS.

The net sales of the company for the year 1916 were \$126,759,000, as against \$92,861,000 the previous year, an increase of \$33,898,000 or about 36 per cent.

PROFITS AND DIVIDENDS.

The net profits of the business for the year 1916, before deducting interest charges, amounted to \$14,743,000; after deducting interest charges the profits were \$11,226,000. These profits cover the dividends upon the preferred stocks, and enhance the intrinsic value of the common stock.

MAINTENANCE.

The custom of maintaining the fixed properties of the company in the highest state of efficiency and charging the cost of such maintenance to expense account has been again followed during the past year. Our plants are all in first-class, up-to-date condition and are now being run to full capacity.

BASIS OF INVENTORIES.

Following our usual practice, inventories of manufactured goods and materials have been taken at cost where cost was below market, and at market where market was below cost. Market to-day is generally above cost.

UNITED STATES RUBBER EXPORT CO., LIMITED.

Our export business, now consolidated under one organization, the United States Rubber Export Co., Limited, is being successfully pushed forward, although it is still relatively small, being only about 6½ per cent of our total business in 1916 as against 5 per cent in 1915.

UNITED STATES TIRE CO.

Our new "Royal Cord" tire and the new non-skid "Usco" tire have given us the most complete line of tires manufactured by any company. There is still a wide and increasing demand for the "Nobby Tread" and "Chain Tread," which are acknowledged to be the best non-skid tires in the market. Our tire sales for 1916 show an increase of 57.9 per cent over those of 1915.

OUR SUMATRA RUBBER PLANTATIONS.

The development of our rubber plantations in Sumatra has steadily continued during the past year. The amount of crude rubber received therefrom in 1916 was substantial and was largely in excess of previously estimated production. The future increase in production will be rapid, as the great number of young trees are more and more coming into bearing. Our most sanguine expectations from these estates are being realized and it is believed that they will prove to be one of the most valuable assets of the company.

ADVANCE IN PRICES AND OUTLOOK.

While the profits of the company for 1916 were the largest in its history, the percentage of profits to sales was less than in the previous year, owing chiefly to the advance in materials and labor during the year. With the view of meeting these conditions an advance in prices of manufactured goods, varying from 10 to 20 per cent was made early this year.

The increase in net sales of the company for the first two months of the present year over the corresponding months of last year exceeds 20 per cent.

CONCLUSION.

It is not just a matter of a century since the United States Rubber Co. commenced business. In that time it has steadily grown. In the last 15 years its business has increased five fold - thanks to the devotion of its working force.

It, therefore, gives me special pleasure to again refer to the continued fidelity and ability shown by the officers, heads of departments, those in charge of our Far Eastern plantations and the other employees of the company and its subsidiaries.

THE TREASURER'S REPORT.

UNITED STATES RUBBER COMPANY AND
SUBSIDIARY COMPANIES

Consolidated Balance Sheet, December 31, 1916.

ASSETS.

Plant, machinery, fixtures, including rubber plantations	17,187,857.57
Investments, including bonds and stocks	848,333.75
Cash	10,000.00
Notes and accounts receivable	723,000.00

Accrued interest, taxes, etc.	801,526.80
Total Liabilities	9,218,788.49
Reserved for dividends	1,223,040.00
Insurance reserve fund	\$932,588.05
Employee's accident fund	368,041.09
Total Reserves	1,300,329.14
Reserve for depreciation	5,000,000.00
Fixed surpluses (subsidiary companies)	13,080,230.78
Surplus	28,479,134.64
Total Liabilities	\$222,366,569.45

Respectfully submitted,
W. G. PARSONS, Treasurer.

ANNUAL ELECTION.

BOARD OF DIRECTORS FOR 1917

The annual meeting of the stockholders of the company was held at New Brunswick, New Jersey, March 20, and the following directors were elected:

James S. Alexander, New York City.
Walter S. Ballou, Providence, Rhode Island.
James C. Brady, New York City.
Nicholas F. Brady, New York City.
Middleton S. Burrill, New York City.
Samuel P. Colt, Providence, Rhode Island.
Harry E. Converse, Boston, Massachusetts.
Edgar B. Davis, Brockton, Massachusetts.
James Deshler, New Brunswick, New Jersey.
James B. Ford, New York City.
Francis L. Hine, New York City.
Henry L. Hotchkiss, New Haven, Connecticut.
William S. Kies, New York City.
Lester Leland, Boston, Mass.
Samuel M. Nicholson, Providence, Rhode Island.
Raymond B. Price, New York City.
Homer E. Sawyer, New York City.
Charles B. Seger, New York City.
William H. Truesdale, Greenwich, Connecticut.

Theodore N. Vail, Boston, Massachusetts.
Elisha S. Williams, New York City.

This list consists of the old board with three additions, namely, James S. Alexander, president of the National Bank of Commerce, New York City; William S. Kies, vice-president of the American International Corporation, New York City; and Charles B. Seger, vice-president and comptroller of the Union Pacific system, New York City. These gentlemen are practically those interested in the Kuhn-Loeb banking group which has purchased the recent new \$60,000,000 bond issue. These three men bring a new element into the board of directors and will emphasize the undoubtedly valuable banking connection which the corporation has recently effected.

ELECTION OF OFFICERS.

The board of directors of the United States Rubber Co., elected at the annual meeting of stockholders, met at the office of the company, 1790 Broadway, New York City, March 22, and organized by the election of the following officers for the ensuing year:

Samuel P. Colt, president; James B. Ford and Lester Leland, vice-presidents; Raymond B. Price, vice-president in charge of development department; Homer E. Sawyer, vice-president in charge of footwear department; Elisha S. Williams, vice-president in charge of mechanical departments; Samuel Norris, secretary; John D. Carberry, assistant secretary; W. G. Parsons, treasurer; E. J. Hathorne, assistant treasurer.

PRESIDENT COLT ENTERTAINS.

On Wednesday evening, March 21, Colonel Samuel P. Colt, president of the United States Rubber Co., tendered a dinner at the Metropolitan Club, New York City, to the directors and operating staff of the company and several New York bankers and personal friends, the main object being to introduce to the heads of departments and operating staff the three newly elected directors, Messrs. Alexander, Kies and Seger.

The dining room was handsomely decorated, and a novelty was that all these decorations were of rubber in its various forms and colors, and the boutonnières, which were artificial flowers in natural colors, were also made of rubber. There were about 60 guests. Speeches were made by Otto H. Kahn, Homer E. Sawyer, William S. Kies, Senator Le Baron B. Colt, Edgar B. Davis, Francis Lynde Stetson, Mortimer L. Schiff, Victor E. Mitchell, K. C., and Dr. Ernest M. Stires. The menus were decorated with photographs of the company's plantations in Sumatra, each menu having a different picture. During the banquet Naham Franko's orchestra furnished a very artistic musical program.

DIRECTORS OF LUMBER COMPANIES TO INSPECT PROPERTIES.

A party consisting of directors and guests of the Atlantic Coast Lumber Corporation and United Timber Corporation, including Colonel Samuel P. Colt, United States Senator Le Baron B. Colt, of Rhode Island; James B. Ford, John D. Carberry, W. G. Parsons, J. N. Gunn, J. Cunliffe Bullock, Walter S. Ballou, Nathaniel Myers, Charles A. Emerson, Henry L. Hotchkiss and H. E. Robinson, left New York City March 23 for Georgetown, South Carolina, on a five-day tour of inspection of the various properties in South Carolina in which they are interested.

RUTHERFORD RUBBER CO. CHANGES.

Recent changes in the Rutherford Rubber Co., Rutherford, New Jersey, forces include the appointment of J. J. White, former manager of the New Haven, Connecticut, branch, as manager of the branch at Cleveland, Ohio; Charles Schoneman, former manager, first of the Hackensack, New Jersey, and then of the Baltimore, Maryland, branch, as division manager; C. A. Reynolds, in charge of all New England branches, and James O'Hea, manager of the new Pittsburgh, Pennsylvania, branch.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AKRON is having a struggle to keep pace with its own growth. Last year our 27 rubber companies manufactured rubber products valued at \$188,000,000, the tire output being 40,000 tires daily. It is reported that not less than 6,500 additional employes are required by the four largest companies alone, to enable the planned expansion in the tire industry to be carried out. An estimate of the present number employed in the Goodrich, Firestone and Goodyear plants is given as about 46,000.

* * *

In presenting the annual report of The B. F. Goodrich Co. and subsidiary companies to the stockholders, Bertram G. Work, president of the company, summed up the past year's transactions as follows:

After making full provision for all maintenance charges, depreciation, bad and doubtful debts, and other items which it was deemed wise to take out of the year's earnings, the net profits for the period amounted to \$9,568,764.87 as compared with \$12,265,679.79 for 1915.

The net sales for the year 1916 amounted to \$70,990,781.66 as compared with \$55,416,866.55 for 1915, representing a gain of 28 per cent. This gain was due to increases in all departments of the business.

The decrease in net earnings was largely due to the fact that advances in selling prices did not keep pace with rapidly increasing costs. Not only materials and labor, but also practically all expenses incident to the conduct of the business were upon a higher scale of costs than during the previous year.

The directors have voted, subject to the approval of the stockholders, to retire 9,000 shares of the preferred stock. This is in accordance with the provision of the company's charter which provides for the retirement of a minimum of 9,000 shares of the preferred stock each year, beginning with July, 1914. After this year's retirement there will remain outstanding \$26,400,000 of preferred stock.

The increase in bills payable shown on the balance sheet, is due to a large increase in inventories which was made necessary on account of increased volume of business, congested condition of markets and delays in transportation.

The company has added to its plant account during the year 1916, extensions and equipment costing \$3,519,549.93. Beyond completing the work under construction, no further important plant extensions are planned at present.

From the surplus at December 31, 1916, the directors voted to set aside \$700,000 for the redemption of preferred stock together with \$121,465.50, representing the reduction of preferred stock purchased, from cost to par, and a further amount of \$100,000 appropriated for addition to the pension fund.

The detailed report follows:

CONSOLIDATED BALANCE SHEET.

December 31, 1916.

ASSETS.

Capital Assets—

Real estate, buildings, plant, machinery and
 sundry equipment, less reserve for de-
 preciation, \$1,825,148.93 \$16,152,461.79
 Patents 370,036.48
 Goodwill 57,292,000.00 \$4,270,504.27

Investments in other companies, etc., 1,192,124.26
 Society Funds—B. F. Goodrich represent-
 ing the net investment at December 31,
 1916 3,183,742.92
 9,057 shares of 7 per cent cumulative pre-
 ferred stock, at par value 630,000.00

Current Assets—

Inventory of raw materials, partly man-
 ufactured and finished stock \$6,147,000.00
 Trade accounts receivable, other debtors,
 reserve to cover doubtful accounts, dis-
 counts and allowances 7,100,000.00
 Other accounts receivable 4,607.79
 Bills receivable 208,406.77
 Cash in banks and on hand 1,314,000.00

Deferred charges on future operations 4,200.00
 Prepaid insurance, interest, taxes, etc.
 \$115,636,879.96

LIABILITIES.

Capital Stock—
 600,000 shares of common
 stock of the par value of
 \$100 each \$60,000,000.00
 300,000 shares of 7 per cent
 cumulative preferred stock
 of the par value at \$100
 each 30,000,000.00
 Deduct:
 27,000 shares of preferred
 stock, redeemed and can-
 celled 2,700,000.00
 27,300,000.00

(The preferred stock is re-
 deemable in case of dissolu-
 tion, liquidation, merger or
 consolidation at \$125 per
 share.)

Contingencies \$2,000,000.00
 Pensions 200,000.00

Appropriation from surplus for redemption of

preferred stock as above 2,700,000.00
 Surplus (per annexed account) 14,919,888.79

SURPLUS ACCOUNT.

December 31, 1916

Balance, January 1, 1916 \$10,583,589.42
 Net profit for the year ending December 31,
 1916, per annexed account 9,568,764.87

Deduct:

7,000 shares of 7 per cent cumulative pre-
 ferred stock at par redeemed and can-
 celled during year \$700,000.00
 Additional appropriation for pension fund 100,000.00
 Reduction of treasury stock, purchased,
 from cost to par 121,465.50
 7 per cent dividend on preferred stock for
 the year ending December 31, 1916 1,911,000.00
 4 per cent dividend on common stock 2,400,000.00

PROFIT AND LOSS ACCOUNT.

For the Year Ending December 31, 1916.

Net sales \$70,990,781.66
 Deduct manufacturing, selling and general
 administration expenses 60,611,332.55
 Profit from operations \$10,379,449.11
 Add Miscellaneous income 235,461.37
 \$10,614,910.48

Deduct:

Provision for depreciation \$890,163.62
 Interest on bills payable, etc. 155,981.99

Net profit carried to surplus account... \$9,568,764.87

At the regular annual meeting of the stockholders held on March 14, at the office of the Goodrich company, 1780 Broadway, New York City, directors were reelected as follows: D. M. Goodrich, F. A. Hardy, C. B. Raymond, H. E. Raymond, E. C. Shaw, and H. E. Joy.

In accordance with a resolution of the directors at their last meeting, the stockholders ratified the reduction of the capital stock of the company by the retirement and cancellation of 9,000 shares of the preferred stock mentioned above.

At a meeting of the directors held immediately after the meetings of the stockholders, the following executive officers were elected: B. G. Work, president; A. H. Marks, vice-president; H. E. Raymond, vice-president; E. C. Shaw, vice-president; C. B. Raymond, second vice-president; W. A. Means, second vice-president; Guy E. Norwood, secretary and assistant treasurer; L. D. Brown, treasurer, and J. C. Lawrence, assistant treasurer.

The following were appointed as an executive committee: B. G. Work, A. H. Marks, H. E. Raymond, E. C. Shaw, C. B. Raymond, W. R. Means and A. B. Jones. L. D. Brown and F. C. Van Cleef were added to the operating committee.

In an address recently delivered before the Cleveland Engineering Society, Dr. W. C. Geer, director of processes of the Goodrich Company, predicted that within two years rubber would replace leather to a large extent in shoe manufacture.

Only 16 years ago the Firestone Tire & Rubber Co. was established for the manufacture of carriage tires on a small scale, and

few tire exhibits. Perhaps the best of these was that of the United States Rubber Co., of New York City.

* * *

The B. F. Goodrich Co. chose auto-show week to place in its big Boylston street window two of its Silvertown cord tire machines, perhaps as intricate and ingenious pieces of mechanism as any used in the tire industry. As a consequence, the sidewalk in front was one of the most crowded areas of its size in the city, and many of the spectators, of a more mechanical turn of mind, invaded the window itself for a closer inspection of the working of these \$20,000 machines, which lay the flattened cords smoothly and evenly over the surface of the carcass, these to be imbedded with rubber and vulcanized. Expert mechanics from Akron were in charge of these automatic machines, which place two layers of cord about the tire in such manner that every inch of cord is under uniform tension. Although the double operation takes about 20 minutes, there were many spectators who watched the entire operation from beginning to end.

* * *

The writer wishes to rectify an error which appeared in the March letter relative to the Plymouth Rubber Co. factory. It was spoken of as being located in Stoughton, Massachusetts, instead of Canton, this state, the concern having removed from Stoughton six years ago. Because, for years before, the writer had always connected this company's name with the town of Stoughton, the error inadvertently slipped in. The new factory building, recently completed, puts Canton the more prominently on the map, and locates it definitely in the minds of all passengers between Boston and New York by way of Providence.

* * *

The Revere Rubber Co. plant of the United States Rubber Co., at Chelsea, has decided to discontinue its electric plant and will rely for lighting and motive power on the Edison company's service, a long-term contract for such service having been entered into within the last month. It is estimated that this will amount to about 5,000 horse power. The steam service, of course, will be continued for heating and vulcanizing purposes. The company's wheel and sole business, which is only a portion of its output, is growing by leaps and bounds, and its specialties in several other lines are in heavy demand at present.

* * *

Mr. and Mrs. Franklin W. Pitcher celebrated the fiftieth anniversary of their marriage at their home in Easthampton, Massachusetts, on Tuesday, March 13. More than 200 guests attended, among them many intimate friends connected with the rubber and textile industries.

Mr. Pitcher, who is treasurer and general manager of the Easthampton Rubber Thread Co., became interested in the elastic fabric business many years ago, and this led him to join in the organizing of the Revere Rubber Co., Chelsea, Massachusetts. He was the first treasurer of that company and afterwards its president. In 1885 he moved to Easthampton to be in close touch with the Easthampton Rubber Thread Co., and with the exception of a few years has ever since resided there, where he has become identified with several of the financial and manufacturing interests of that town. Both Mr. and Mrs. Pitcher are natives of Maine and were married at Pittston, that state, March 13, 1867. They have two sons and a daughter. One son, William L. Pitcher, is superintendent of the Easthampton Rubber Thread Co.'s factory, and the other, Walter F. Pitcher, is treasurer and general manager of the Franklin Steel Works.

* * *

The Boston Woven Hose & Rubber Co. did a very prosperous business last year, its sales exceeding \$6,000,000, and it is expected that for the present year it will reach the \$7,000,000 mark in output. Last year its net earnings are reported to have been

nearly 40 per cent on its \$2,000,000 common stock after paying the preferred dividends. The sum of \$322,710 was spent out of earnings on new buildings and equipment and \$750,000 transferred from the surplus to capital account. Extra cash dividends have been paid in 1912, 1914 and 1915, to a total of 110 per cent, besides the annual dividends, and the rights to purchase the new issue of \$1,000,000 common stock are held at a substantial premium.

* * *

President George B. Dryden and Vice-President George C. Reeves, of the Dryden Rubber Co., Chicago, Illinois, were in Boston several days the middle of the month, making their headquarters at the Boston office, which is in charge of J. A. Ford. This company, which makes a large variety of molded goods, is finding a heavy increase in the demand for its fiber soles and rubber heels, which are being used extensively by shoe manufacturers.

* * *

The award of contracts for 16 dirigibles by the United States Government will doubtless result in at least a share of the business coming indirectly to the American Rubber Co. factory of the United States Rubber Co. at Cambridge. This factory has made a special study of balloon fabrics, its line of this material having been used for the United States Navy balloons ordered of the Connecticut Aircraft Co., one of the concerns which has secured a share of the new contract.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE demand for rubber goods of every description continues on the same record breaking plane that has characterized the industry for more than two years, and it is uncertain when there will be any appreciable diminution. While the European War with its enormous demands, unquestionably has a most substantial effect on the unprecedented activity of the rubber factories, there is no denial of the fact that the normal demand for ordinary production is increasing at a rate seldom, if ever, equaled in any other industry. This is especially true as regards the manufacture of automobile tires and other accessories.

All the factories in Rhode Island are still being driven to capacity, notwithstanding which the accession of orders exceeds the output and has done so for months. From every plant comes a similar complaint that more operatives could be utilized to good advantage, but that it is impossible to obtain additional help. The scarcity of help is all that deters, in several instances, the extension of plants by the erection of new buildings or the construction of material additions to the present buildings.

* * *

Deeds and mortgages involving all the rubber manufacturing plants in Rhode Island that are subsidiaries of the United States Rubber Co., were placed on file in this city, Woonsocket and Bristol, on March 7, transferring to the parent corporation all the holdings in this State and elsewhere. The mortgage, which covered over 230 typewritten pages and is for \$97,252,900, covers not only the properties in Rhode Island, but in six other States—New York, New Jersey, Massachusetts, Connecticut, Indiana and Michigan—and is given to the Central Trust Co. of New York, to secure the principal and interest on the recent issue.

The Rubber Goods Manufacturing Co., a corporation controlled by the United States Rubber Co., also placed on record a mortgage to the Central Trust Co. of New York, as trustees, covering properties in several States, to secure gold bonds aggregating \$27,293,100.

Previous to the filing of the mortgages here and elsewhere, deeds were placed on record conveying all the property in Providence, Woonsocket and Bristol, as well as in Milville. As a

the United States Rubber Co., the plants of the Revere Rubber Co., the Joseph Banigan Rubber Co., the Woonsocket Rubber Co., the National India Rubber Co., the Lawrence Felting Co., all subsidiaries of the parent company, and the plant of the Mechanical Fabric Co. was conveyed to the Rubber Goods Manufacturing Co.

A new motor ambulance has been purchased by a committee of overseers and others at the factory of the National India Rubber Co., at Bristol, as a memorial to the late Le Baron C. Colt, former vice-president and manager of that corporation and a nephew of Col. Samuel P. Colt, president of the United States Rubber Co.

The ambulance is to be used in conveying the sick and injured to hospitals or to their homes. It will be housed at the garage of the factory of the National Co., on Wood street, and will be free of charge to all who desire its services. It was purchased from a fund raised by the foremen, office help and others at the National Rubber Co., and by relatives and friends of the late Mr. Colt, outside of the factory.

The late Robert J. Bowes, of Millville, Massachusetts, for many years manager of the Lawrence Felting Co., and son of the late William J. Bowes, who founded the concern, left an estate of \$108,019.25 in personal property and \$5,450 in real estate.

Some of the departments of the Lawrence Felting Co.'s plant, at Millville, were unable to operate for several days the early part of the past month owing to the high water in the Blackstone river, which was caused by the bursting of a dam at Uxbridge. The river, on March 1, reached a point more than 20 inches above its ordinary level.

The Fisk Rubber Co., of New York, has given up its branch store at 17 Dorrance street and concentrated its local business at 134 Fountain street, Providence.

The Central Automobile Tire Co., of 111-119 Stanford street, Boston, has opened a branch at 15-17 Dorrance street, Providence.

H. T. Mason, of Boston, manager of the sole and heel department for New England of the Goodyear Tire & Rubber Co., was the principal speaker at the annual meeting of the Rhode Island Shoe Retailers Association on March 6. He spoke at considerable length in a description of "Neolin" soles.

The Anchor Weaving Co. has had plans drawn for a one-story office building, 50 by 60 feet, and a one-story and basement weave shed, 40 by 120 feet, in addition to its plant on Brook street, Pawtucket. The company has recently increased its capital stock from \$60,000 to \$150,000, according to its statement filed at the office of the Secretary of State.

By an act of the Rhode Island General Assembly, the corporate name of the Phillips Insulated Wire Co. has been changed to Phillips Wire Co., without any change in capitalization.

Terrence McCarthy, president of the Narragansett Rubber Co., Bristol, was removed to St. Joseph's Hospital, Providence, on March 13, to undergo medical treatment. He has been ill since about the first of last December and after a series of X-Ray pictures had been taken it was decided to remove him to the hospital. He is reported as improving.

J. Victor Stone, chief chemist of the Revere Rubber Co.'s plant, Valley street, Providence, gave an interesting address on the manufacture of rubber, illustrated by stereopticon views, before the Brotherhood of the Elmwood Christian Church recently.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE death of Ferdinand W. Roebbling, Sr., secretary-treasurer and general manager of the great wire mills of the John A. Roebbling's Sons Co., occurred March 16. Business throughout Trenton was practically at a standstill while the funeral services were being conducted.

John A. Lambert, treasurer and general manager of the Acme Rubber Co., gave an interesting talk on the subject of rubber to the members of the Trenton Rotary Club at a recent meeting of the organization.

Joseph B. Linerd has been made a member of the board of directors and appointed general manager of the Globe Rubber Tire Manufacturing Co., Trenton, New Jersey, with an executive office at 1853 Broadway, New York City.

J. B. LINERD.

Mr. Linerd is a man of ripe experience in the tire industry. After four years with the Goodyear Tire & Rubber Co., Akron, Ohio, he became associated with the Ajax Rubber Co., Inc., New York City, of which company he was shortly afterwards appointed sales manager.

It is stated that the appointment of Mr. Linerd is the first step in an intensive, nation-wide sales campaign which will be conducted from the new executive office at the above mentioned location. The Globe company has been manufacturing hand-made automobile tires for four years, and last year it was found necessary to double its capacity. These increased facilities give it a capacity of 1,000 tires per day, with a present demand sufficient to market this output.

The private mark of an automobile tire dealer in this city enabled the police of Bridgeport, Connecticut, to trace the owner of an automobile which had been stolen here. The car was found abandoned in Bridgeport, with every mark which might lead to identification apparently removed. The police in their efforts to trace ownership took off the tires and discovered a marking by which a Trenton tire dealer was able to tell to whom he had sold the tires.

The Court of Errors has rendered an opinion upholding a decree of Chancellor Backes in which he ruled that Isaac Finelerg must pay to Harry Freedman the sum of \$12,197 in settling up a partnership in a rubber reclaiming business in which they were engaged in this city.

The Crescent Insulated Wire & Cable Co. has filed with the Secretary of State, a certificate increasing its capital stock from \$250,000 to \$1,000,000. General C. Edward Murray is president.

RUBBER ASSOCIATION OF AMERICA MEETINGS.

At the meeting of the Arbitration Committee held in the Association rooms, March 15, W. F. Bass and M. L. Cramer were elected to serve for one year; Horace De Lisser and A. H. Brown, two years; W. E. Bruyn and R. B. Woodbury, three years, and W. G. Ryckman, chairman, three years.

The Executive Committee of the Rubber Reclaimers' Division met on March 29 and prepared a circular on "Standards of Rubber Scrap Specifications and Packing," to be submitted to the meeting of the entire division on April 11.

The Rubber Sundries Manufacturers' Division met March 30 to decide on the "Open Price Exchange" matter.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

DURING last November a prominent waterproofer told me he could book orders for 100,000 waterproof garments, but that it would be utterly impossible to turn out the goods as the whole capacity of his factory was required for government work. Since that time we have had an almost uninterrupted spell of wintry weather, our coldest time for 35 years. It is not surprising, therefore, that the home demand for waterproof goods has slackened off considerably. On one or two occasions there has been a run on goloshes, which are by no means superabundant, and it is noticeable that two or three firms are now repairing old and leaky ones, a thing one was told a few years ago could not be done. It is remarkable how the official pronouncement to save money by wearing your old things has been carried into practice, all sorts of commodities being either utilized in their worn state or made presentable by some process of renovation. Mention may be made of the use of old bicycle tires by the cobbler for patching boots. This mention of tires leads me to remark that the decrease in the output of tires for private motor cars, owing to the available hands being wanted for government work, has now been followed by severe restrictions on private motoring, so that the lack of tires will hardly be felt.

RUBBER BUSINESS SLACK.

Although raw rubber remains at about pre-war prices in contradistinction to most other commodities, the immediate future at the time of writing is full of uncertainty, owing to prospective developments in the international situation. As regards the rubber business generally, there is a decided slackness, owing to many large government orders having been worked off and home demand for private consumers being decidedly small. The high price of cotton has proved a setback to the staple Lancashire industry, which is in a very unsettled state. It is announced that the imports of many classes of goods, especially of the luxury type, are to be strictly curtailed. Whether American rubber sponges sold at 6d. each, and Japanese air-cushions at 1s. 6d., will be considered as luxuries I do not know, but it is certain that their classification as such would not be objected to by home manufacturers, who have watched their advent and sustained popularity with some concern.

EMBARGO LIST ADDITIONS.

The extension of the embargo list of May 10, 1916, affects among other exports those of goods made wholly or partly of rubber, gutta percha or balata, which can now be exported only to British possessions and protectorates, all other destinations being prohibited. This, of course, takes them out of a previous class, where they were prohibited being exported to any and all destinations.

ACCELERATORS.

Before the Manchester Section of the Society of Chemical Industry on February 2, S. J. Peachy, of the local school of technology, read a paper on this subject, dealing mainly with para-nitrosodimethyl aniline, patented by the author, and now on the market under the name of accelerine. The facts presented regarding accelerine were much the same as in the review of the organic accelerators in the January 1, 1917, issue of THE INDIA RUBBER WORLD. It was emphasized that the accelerating effect of aniline is extremely small, though methyl aniline is decidedly better. In order to produce a non-blooming rubber with accelerine there can be no saving of time, the ordinary length of cure, as with sulphur alone being necessary. Accelerine is sold in bulk with 30 per cent of

water, which must be removed before use. The substance shows a tendency to cake on the back roll of the mixer, and it is desirable to mix 20 per cent of Kisselgahr with it to overcome this.

An interesting discussion followed the reading of the paper. In reply to some remarks by Mr. Terry, the author said that he had experimented only with low-grade reclaimed rubber and that, therefore, the statement that accelerine was of no use with reclaimed rubber might have to be modified in the case of high-class alkali reclaims. With regard to detection of accelerine it was usually noticed that the acetone extract had a dark color. Mr. Smith, as one who had used a good deal of accelerine, commented on the fact that all the samples shown were in sheet form press-cured, and suggested that difficulties had arisen from blowing in the case of solid rubber, steam-cured. On this matter, and also as to whether accelerine was useful in eliminating the effect of the variability in plantation rubbers, the author said that the present extent of his experience did not allow him to express a decided opinion. It was agreed that accelerine had a decided though faint darkening effect on rubber and that its use was not desirable in the case of very white rubbers.

AYER ACCELERATORS TO BE MADE IN ENGLAND.

An interesting matter in connection with the use of accelerators came before the patent authorities a little time ago. This was an application by the North British Rubber Co., Limited, to manufacture for its own use accelerators patented in this country by the Bayer Co. This application was opposed by Alfred Smith & Co., a Manchester firm of rubber chemical manufacturers, which had obtained the sole agency for the manufacture and sale under royalty. At a later date an application was made by the Hooley Hill Rubber & Chemical Co., located a few miles from Manchester, for a license to manufacture for its own use and to sell to others the piperidine accelerators patented by the Bayer Co. These licenses have been granted. It is noticeable that though either time or sulphur may be saved by the use of accelerators in practice the saving in time is always aimed at, despite the phenomenal rise in the price of sulphur in the last two years. Of course, it may yet turn out that the rapidity of vulcanization is not altogether to the benefit of the rubber goods as regards lasting capacity.

BUSINESS PRINCIPALS REQUIRED TO REGISTER.

The Registration of Business Names Bill having now come into operation it is imperative for the A B C and X Y Z Rubber companies which may be doing a retail business in towns to register the names of their principals. Although the act is essentially a piece of war legislation aimed at alien traders it may be remembered that the idea is by no means new, as previous bills have been brought before Parliament by private members to achieve the same object. These bills, however, failed to pass into law, owing to non-alien obstruction.

THE LABOR PROBLEM AFTER THE WAR.

The period of demobilization is seen to be one in which troubles, if not actually chaos, may well be expected if the matter is not taken in hand by experts removed from officialdom. It is interesting, therefore, to note that a strong executive committee has been formed by the Federation of Employers and Employees to tackle the problem of the reabsorption into industry of labor released from military duties. On this committee the name of James Tinto, head of the Irwell & Eastern Rubber Co., Limited, appears as representative of

the rubber trade. I may mention that H. L. Rothband, of Mandleberg & Co., Manchester, has issued a book explaining his scheme for promoting the employment of disabled soldiers and sailors. An objection to what is at present being done by the labor exchanges is that the latter ask the manufacturers what wages they are prepared to pay a man before they have had an opportunity, by interview, of forming an estimate of the man's probable worth.

TRADE NOTES.

The establishment of the Pirelli General Cable Works, Limited, at Southampton, has been in operation two years. It is probably the most modern in equipment of all such works. Situated on a private pier, with a great electrical crane and with monorail system, its materials and its finished product can be quickly received, moved to any portion of the plant or shipped with facility. Only a third of the available area is covered with two-story buildings. All the machinery is propelled by electricity, secured from the city mains. A boiler house supplies steam for rubber working, cable heating and drying, and the lead furnaces are heated by gas produced on the grounds. Both rubber and paper insulated wire are manufactured, as well as tape and insulating material.

This corporation is a joint enterprise of two world-known concerns, the General Electric Co., Limited, one of the largest firms of electrical manufacturers in Great Britain, and Pirelli & Co., of Milan and Spezia, Italy, the largest producers of rubber goods and cables in Italy. Its work is largely on government orders.

The Parent Tyre Co. has virtually all its capital of over £2,000,000 invested in the Dunlop Rubber Co., and it has an agreement for a royalty of 6 per cent on the Dunlop net profits. This year the royalty amounts to £24,000, compared with £23,410 a year ago. The maximum dividends of 5 per cent and 8 per cent have been paid on the preferred and common shares, the deferred shares getting 7 per cent.

In a recent High Court trial, judgment was given for the Alpertons Rubber Co. in an action to prevent Mr. Manning, its late manager, from utilizing his formula book for the benefit of the Beldan Tyre Co., by whom he is now employed. There were special circumstances in this case, and I am not criticizing the judgment. The defendant's counsel, however, asked leave to appeal, saying that the decision affected works managers generally, as they had always considered that they had a right to utilize formulas acquired by them in the course of their employment. The leave to appeal was not granted, though there are many in the trade who would like to have heard the decision of the Appeal Court.

THE SITUATION IN RUSSIA.

By a Special Correspondent.

THE remarkable overthrow of the monarchy and probable establishment of a republic has opened Russian doors to America and promises to become a milestone in Russian-American trade relations. With one-sixth of the land area of the globe and a population of nearly 200,000,000, our country has long presented one of America's largest possible foreign markets, and one that has been growing rapidly with a rising civilization and quickening development. Although the circle of the Imperial family had other preferences, the Russian people, if they can maintain the new government, as now seems likely, will welcome American goods for immediate needs, and after the war, private capital for the development of vast natural resources.

There is every indication that no contracts or debts will be abrogated as a result of the revolution, as the government's finances are in excellent condition, and the policy of the people contemplates a more energetic prosecution of the war.

BANKING FACILITIES.

The banking machinery of Russia consists of The Imperial Bank, the Land Banks and the Government Savings Banks, all operated by the banking department of the government; the commercial or joint stock banks, which are private institutions; municipal banks, and mutual credit societies. The Imperial Bank is the largest bank in the world, its statement for October, 1916, showing total assets \$5,150,000,000 at the par value of the ruble*, and the total gold resources of \$1,854,000,000. It is the bank of issue for the entire empire, and although it may do a commercial banking business, its principal activities are with other banks, for which it receives deposits, makes loans and rediscounts bills. The Land Banks are of two classes, known as the Land Bank of the Nobility and the Land Bank of the Peasants, the latter having been created to facilitate the distribution of land to the peasant classes. The government operates a State Savings Bank with over 10,000 branches scattered through the Empire, which are the depositories of the savings of the people. On October 1, 1914, their total deposits amounted to about \$875,500,000 at the par value of the ruble, but these savings have increased greatly during the war. On August 14, 1916, they approximated \$1,648,000,000. While this is attributable in some measure to the abnormal prosperity incidental to the war, it is more directly attributable to the abolition of vodka, which has encouraged expenditures chiefly for better living facilities, clothing and food, and greatly increased average savings. The total increase in approximately two years, at the par value of the ruble, amounts to \$772,500,000, and at the present exchange value, about \$450,000,000.

Joint-stock banks, established in Russia in 1864, numbered 45 with 732 branches in 1913, with a total capital and surplus of \$381,615,000 and with deposits aggregating \$1,184,500,000 at the par value of the ruble. Not only do these banks exercise the usual functions of commercial banking, but they participate in the industrial activities of the country, financing, and in some cases owning outright, various industrial and commercial enterprises. Although not organized under a general banking law, each has a special government charter and operates under the supervision of the banking department of the government. This tremendous banking capital seems to be fully employed. For many years rates have averaged high, as is natural in a partially developed country. Bank failures involving a loss by depositors are practically unknown. The business is operated according to banking principles obtaining throughout the world. The commercial laws of the country are well established and adequately interpreted by the courts, so that apparently the banking operations of the country are as stable as those of any other nation.

MOVING THE "PROWODNIK" CO. TO MOSCOW.

The removal of the entire industry of the "Prowodnik" Co., the pioneer rubber manufacturing concern in Russia, from Riga to Moscow is worthy of more than a passing notice. Here was a practically unprecedented task. An industry with a capital of 50,000,000 rubles,* possessing a plant covering 3,000,000 square meters, machinery requiring 20,000 horse-power engines, and employing 18,000 persons being transferred bodily some 600 or 700 miles, rebuilt and reestablished in the short space of a few months, is a feat well worth recording.

This great industry was situated at Riga, on the gulf of the same name, an arm of the Baltic Sea. It was manufacturing many lines of rubber goods for trade and for the Russian Government. As a measure of precaution the factory was closed, but its importance to the government was such that the removal was advised from the coast to the heart of the nation.

It was a stupendous task, but with an energy worthy of the cause, it was accomplished by the aid of a force of engineers and workmen. Over 5,000 carloads of machinery and material were

*Ruble equals \$0.515.

transported, new buildings erected, and to-day over 7,000 employes are at work, turning out goods exclusively for the use of the government.

PRODUCTS AND VOLUME OF BUSINESS.

The principal products to-day are tires, solid and pneumatic, for motor cars, trucks, motorcycles, aeroplanes and army field ambulances. Besides these are manufactured pontoon bags, life preservers, protective masks (for use against asphyxiating gases), balloon fabric, carriage cloth, insulated wire, a variety of accoutrements for use in the army and navy, and hard rubber articles for electrical and medical use.

At the time of the closing down of the Riga establishment the output of pneumatic tires was 1,000 per day, but the principal business was the production of rubber footwear. In 1914 the daily production was nearly 100,000 pairs, and the total business of the company was upwards of 65,000,000 rubles. Its main outlet consisted of the 300 stores or branch establishments throughout Russia, though its export trade was widespread and steadily extending. Indeed, so important was this department of the business deemed by the Czar that he conferred on the director general of the works the honorary title of "Councillor of Manufactures," and later, because of services to the government, "Councillor of State."

WELFARE WORK.

In this connection it may be well to show how thoroughly this great corporation is following modern methods in welfare work. At the time of closing the works at Riga there were in operation, for the benefit of the employes and maintained by the company, schools, libraries, canteens, parks, hospitals with clinics, free medical aid, lying-in hospitals, nurseries, lecture halls, and a casino. The company built comfortable dwelling houses for its workers, established free savings banks, insured the lives of all workers after ten years' service and provided accident insurance and sick benefits. Not all these have yet been reestablished at the new works at Moscow, but plans are being completed for doing so as soon as the times will allow. Meanwhile, since the commencement of the war, this corporation has maintained a hospital at Petrograd, with 100 beds, for soldiers wounded in the defense of Russia.

Despite the heavy expenditures engendered by this removal, the company paid 10 per cent dividends in 1914 and 1915.

"TREUGOLNIK" PROSPERING.

The Russian-American India Rubber Co. "Treugolnik" is in receipt of numerous testimonials from the different ministries and departments of the government testifying to the satisfactory manner in which it is serving the cause in the interest of national defense. The plant at Petrograd is being worked to its utmost capacity, and almost exclusively on government work, supplying all kinds of rubber articles used by the different departments for war purposes.

It is reported that this company contemplates increasing its capital. Starting over 50 years ago with a capital of 500,000 rubles, this has been increased at various times. Only last year it was raised 9,000,000 rubles, and this latest report is that the contemplated increase will bring the capital stock up to 30,000,000 rubles, new shares being issued at the rate of 200 rubles for each 100 ruble (nominal) share. The company manufactures practically everything in rubber goods, and has been wonderfully profitable to its shareholders.

NEW RAINCOAT FACTORY IN AMSTERDAM.

Despite the scarcity of building supplies, raw materials and other difficulties incident to the war, a new establishment for the manufacture of waterproof clothing, to be known as the Hollandia Factories, has been erected by Kattenburg & Co., Amsterdam, Netherlands. The building is 262 by 58 feet, five stories high, and about 1,000 persons will be employed. Aside

from raincoats of rubber and waterproof cloth, for men and women, certain other classes of garments for women will be manufactured. Operations were recently begun with a large stock of materials, and the rapid growth of the plantation industry in the Dutch East Indies gives reasonable assurance that rubber for the principal product of the firm will not be wanting.

CRUDE RUBBER SWINDLE IN HOLLAND.

A rather ingenious scheme of some enterprising rascals has been discovered by the Amsterdam police. Letters have been sent broadcast telling of the existence in Amsterdam of a lot of crude rubber, not controlled by the Nederlandsche Overzee Trust, which had been smuggled into the country. The persons addressed are solicited to take shares in this rubber, and to forward proportionate sums for expenses, commissions, etc. The fact that some time ago a lot of 150,000 kilograms of crude rubber was smuggled into Holland in shipments of tobacco gave some semblance of possibility to this story but this rubber is now under control of the N. O. T., and under no circumstances will it be released. The police have sent out warnings, but as far as can be learned no arrests have yet been made.

RUBBER COMPANY'S CONTRIBUTION.

A press dispatch from Berlin of March 9, makes the announcement that the first subscription to the sixth German war loan was made by the Continental Caoutchouc & Gutta Percha Co., of Hanover, and amounted to \$2,500,000.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

ACCORDING to the official statistics, 1916 imports of crude rubber into Japan showed an increase of 2,727,832 pounds, and \$1,897,209 in value over 1915. This was due to double the previous home demand and a greatly developed export market.

IMPORTS OF CRUDE RUBBER.

From—	1915		1916.	
	Pounds.	Value.	Pounds.	Value.
British India	1,114,441	\$470,329	1,334,337	\$743,582

Totals		\$610,084		\$1,270,494

1916, to the value of imports of rubber goods for 1915 and 1916, automobiles and parts (including tires) were imported to the value of \$277,743 in 1916 against \$827,33 in 1915 and bicycles and parts (exclusive of tires) to the value of \$238,807 in 1916 against \$156,501 in 1915.

These, including increased imports of submarine telegraphic and telephonic cables, rubber boots, and overshoes, have not been made in sufficient quantity, nor as well, in Japan. The demands for reclaimed rubber have been gradually increasing. Waste rubber produced in Japan in 1916 amounted to about 50,000,000 pounds [\$175,000], 60 per cent being used for 300,000 pairs of "Tabi" soles [\$30,000], 2,000,000 pairs of "Z" soles [\$120,000] and 1,000,000 pairs of "Tabi" soles [\$150,000], and the remaining 40 per cent for other goods.

NOTES ON MANUFACTURE OF RUBBER GOODS

	1915.	1916.
1. Automobiles and parts (including tires)	827,331	277,743
2. Bicycles and parts (exclusive of tires)	156,501	238,807
3. Rubber boots and overshoes	10,000	15,000
4. Submarine telegraphic and telephonic cables	5,000	10,000
5. Waste rubber	175,000	175,000
6. Total	1,173,832	715,550

Jinrikishas were also exported to the number of 9,465 [\$170,743] in 1916 against 7,931 [\$129,504] in 1915, and bicycles and parts (exclusive of tires) to the value of \$806,815 in 1916 against \$277,326 in 1915. Moreover, in 1916, there were exported rubber dolls, balls and balloons to the value of about \$500,000 and 1,200,000 valves for bicycle and automobile tires to England, United States and Australia. A new line of exports to Singapore consisted of 6,145,796 [\$110,247] porcelain latex cups and 1,565,621 [\$32,492] glass latex cups.

Japanese manufacturers were hampered by double the normal price of coal and four or fivefold increases in the prices of ingredients, but their troubles were lessened by large production and some firms were able to declare dividends of 10 to 40 per cent. Makers of druggists' sundries, toys and balloon fabrics exported their goods to England, British India, Canada and the United States mostly through Japanese traders in Yokohama or Kobe. Rubber tire makers consumed about 1,800,000 valves, 80 per cent of this number of tires being exported. Home demands increased 30 per cent above the 1915 consumption. Mechanical rubber goods production was about double that of the preceding year, consisting for the most part of hose and packing.

Several small companies were organized during 1916 and most of the well-established firms enlarged their factories to increase capacity. The Kono Rubber cloth works at Tokio, which was burned last summer, has been rebuilt during the winter and The Fujikura Electric Wire Co., Limited, also in Tokio, and one of the largest electric wire works in Japan, which was destroyed by fire in the winter at a loss of about \$150,000, will also probably be rebuilt under the new factory law which went into effect September 1, 1916.

UNION RUBBER CO. REORGANIZES

The Dunlop Rubber Co. (Far East), Limited, of Japan, held a meeting of creditors at the company's offices, Wakinohama, Kobe, on February 16. The company was placed in voluntary liquidation for the purpose of transferring the business to a new corporation to be organized under the laws of the Empire of Japan. The new corporation, which will have the title of The Dunlop Gomu Kabushaki Kaisha Corporation, will take over all the assets and liabilities of the old company and continue the business under the same management.

JAPANESE POTASSIUM CHLORATE INDUSTRY GROWS.

Since the outbreak of the European war the number of firms manufacturing potassium chlorate in Japan has increased from one to at least eight, and production has increased from 300 to over 3,500 tons a year, much of it being exported to China, Russia and the South Sea Islands. Firms manufacturing this product must have the permission of the government in order to export it.

BRAZILIAN NOTES.

THE competition of Eastern rubber is one of the gravest questions which Brazil is to-day called upon to face. The tremendous increase in the production of plantation gum, and its steadily diminishing cost of production places this country in the position which necessitates a similar decrease in the expense of gathering and forwarding this country's product. The Para and the Amazonas state governments recognize this necessity, and are encouraging agricultural expansion, with the object of producing at home the various food materials which are now imported at high cost.

The financial crisis, which commenced prior to the European conflict, but which was undoubtedly heightened by that conflict, appears to have diminished in effect and steadily improved conditions are confidently predicted.

TELEGRAPH COMPANY PROSPERS

The Amazon Telegraph Co., whose lines extend more than a thousand miles up the Amazon, has had a successful year, its net profits showing a gain of £6,886 over that of 1915. The line is now double the entire distance from Para to Manaus, each being on a separate route, thus lessening the liability of failure of communication through freshets, windfalls, or interference by the natives. It is now very seldom that both lines are simultaneously out of commission.

Mr. Keith's position as chairman and managing director has been filled by the appointment of F. F. Nosworthy, who was in complete control of the company's Amazon business, and who made the survey for the second line in 1907 to 1909 and superintended the completion of that project in the two following years. He predicts a brilliant outlook for the company's business the present year, largely based on the prosperity of the rubber and cocoa production of the Amazon basin.

A GROWING BRAZILIAN RUBBER FACTORY

A well-equipped rubber factory employing 30 workmen and producing a variety of mechanical goods is one of the industries of Sao Paulo, Brazil. It was founded four years ago, is owned by Theodoro Putz & Cia., and represents a capital investment of \$35,000.

The factory, located at 179 Abilio street, is equipped mainly with British and German machinery consisting of the usual washers, mixers, calenders, vulcanizers, etc., all driven by electric power.

The principal manufacture consists of solid tires of several kinds for auto trucks and heavy vehicles. A large variety of mechanical goods is manufactured. Car springs, electrical articles, hose, tubing packings, cylinders for coffee and rice machines, heels, etc., in fact, almost every kind of rubber goods except tire casings, inner tubes and fabrics. The crude material is mainly mangabeira rubber, produced in the State of Sao Paulo, and Amazon grades, shipped direct from Para.

TRINIDAD RUBBER SHIPMENTS INCREASING.

For the month of January, 1917, shipments of crude rubber from Trinidad totaled 1,164 pounds, all of which was sent to the United Kingdom. During the same month in the years 1912, 1913, 1915 and 1916 no shipments are recorded, and in January, 1914, only 105 pounds were exported.

RUBBER FOOTWEAR DUTIES IN COLOMBIA.

Duties on merchandise imported into Colombia are levied on the gross weight (so much per kilo = 2.2 pounds), which includes paper, cartons, and the case, box or crate in which the goods are packed. Shoes wholly of rubber are dutiable at \$1 per kilo; cotton duck uppers, with rubber soles, \$1.50 per kilo, and linen uppers with rubber soles, \$1.70 per kilo.

Rubber Planting Notes.

INSURING THE PURCHASE OF HEALTHY RUBBER SEED.

A PRACTICAL means of ascertaining the proportion of healthy seed in a large quantity is suggested by C. M. Hamaker in the "Netherlands-India Rubber News."

Out of a shipment ready for transportation, 100 healthy and 100 sickly seeds are taken, opened and weighed. The latter are easily found by their much lighter weight, usually about 2 grams.

The seed for shipment is then placed in boxes or bags by means of a measure containing 100 seeds. The number of the measures thus packed into each box or bag being counted, it is an easy matter to ascertain the total.

As the average weight of a healthy seed can be computed, it is simple to determine what proportion of the total contents is composed of healthy seeds. The difference between the calculated and the actual weight, divided by the difference in weight of a healthy and a sickly seed, gives approximately the number of the latter which must be in the box.

FIRE LOSS AND RESPONSIBILITY.

A very considerable loss of young rubber trees is reported on the United Temiang (F. M. S.) Rubber Estates, nearly a hundred acres of four-year-old trees being damaged by a fire which spread from a neighboring estate owned by Japanese. A judicial decision has been obtained finding the Japanese owner liable for the damage done, the amount to be paid by him being referred by the Court to an arbitrator.

BRITISH NORTH BORNEO PRODUCTION INCREASES.

While the exact figures for 1916 are not yet available, it is estimated that the rubber production of British North Borneo increased 1,140,000 pounds over that of the calendar year 1915. There are now 24 rubber producing companies, a gain of five over the previous year.

PROGRESS OF HEVEA PLANTING IN BRITISH GUIANA.

According to the government report for 1915 the planting of *Hevea* in British Guiana is increasing slowly. It is estimated that at the end of that year nearly 5,000 acres had been planted with *Hevea*. The Department of Agriculture sold 23,000 young trees to planters that year.

The report goes on to say that it has been conclusively proven that this Para rubber tree grows well on suitable lands in the colony and that tapping is just beginning, as the majority of the trees in the planted area are young. These initial tappings of five and six year old trees have shown that the yields of dry rubber per tree compare very favorably with those obtained in the Straits Settlements, Malaya and Ceylon, and that the quality of the product is excellent. Tapping operations will be on a far larger scale hereafter.

The balata industry, which had suffered adversely at the commencement of the war, had practically quite recovered by the beginning of April, 1915, and bleeding operations were pursued as hitherto during the period. The quantity of balata exported during the year was 1,557,213 pounds. Fourteen companies and individuals controlled this output.

PERU'S RUBBER EXPORTS.

The Peruvian Government recently published statistics of foreign trade for the calendar year 1915, which show that crude rubber exports from that country during that period amounted to \$2,937,891, compared with \$2,169,445 in 1914.

LIMA BEAN AS A COVER CROP IN RUBBER PLANTING.

In Java extensive use is made of the lima bean (*Phascolus lunatus*) as a cover crop on rubber plantations. This legume, locally called Kratok, is sown and allowed to run on the ground between the rows of rubber trees, leaving a clean, cultivated strip of land in which the trees are growing. The vines are cut back from time to time so as not to interfere with the tapping and collection of latex, and of course are not allowed to climb the rubber trees.

In addition to its value as a nitrogen gatherer, the lima bean is valuable in preventing soil evaporation in the dry season, and in impeding soil erosion during the wet season. It is also of exceptional value for smothering weeds. The usual procedure is to plow and harrow, plant three seeds in each hill, the hills being from 20 to 40 inches apart, and give one or two hoeings to clear away weeds until the plants are well established.

DUTCH EAST INDIA PROSPEROUS.

The Dutch East Indies are producing a steadily increasing quantity of rubber. In 1916 this amounted to about 12 per cent of the world's total production. Experts declare that rubber will eventually head the list of agricultural exports from these islands. Plantation rubber has gained so greatly over forest production that even if prices drop considerably after the war, the plantations can still sell at a profit, whereas work in the South American forests will have to be curtailed.

The chances of competing successfully with the British East Indies are held to be favorable. The plantations in Ceylon and the Straits Settlements cover an area twice that of those in the Dutch East Indies. The climates and soil correspond, and the average yield per tree under similar conditions is practically equal. But labor is cheaper and more easily obtained in the Dutch East Indies and the taxes and duties are lower than in Ceylon and the Malay States. Dutch planters are therefore able to produce rubber at a lower cost than their competitors. The fact that British planters are highly taxed for war expenses gives the Dutch planters an added advantage.

The prospects for 1917 are very satisfactory. The United States was a large buyer in 1916, the total exports to that country being 9,500 tons. The figures for 1917 are expected to be still more favorable. Numerous companies have already sold a great part of their 1917 crop to United States buyers at very profitable prices.

FUNTUMIA RUBBER IN THE CAMEROONS.

Rubber has become an increasingly important product of the Cameroons. Until just previous to the European war the exports of this product formed nearly 50 per cent of the total exports, amounting, in 1913, to a value of \$2,804,220. The first attempts at rubber exploitation were made in the northern part of the colony, where the *Landolphia florida*, which was then regarded as the greatest rubber-producing plant, was found. About 1901 the vast forests of Southern Cameroon were discovered to contain great numbers of *kickxia* trees, and the natives were soon set to gathering the "silk rubber" therefrom; but their methods were crude, and resulted in the destruction of so many trees that the movement soon fell off. The rubber crisis of 1912 also caused a decrease in the wild-rubber trade, but at the same time it gave considerable impetus to the establishment of rubber plantations.

Realizing that the *Funtumia (Kickxia) Elastica* was indigenous to the Cameroons, the German planters commenced to cultivate it about four or five years ago, and now there are many plantations containing thousands of trees that will soon

from the rubber large quantities of first quality plantation rubber. "The Journal of the Royal Society of Arts," referring to the cost and method of production, says the cost of the upkeep of planted areas is calculated at about 30s. per acre for the first year, 22s. for the second, 18s. for the third, and 10s. for the fourth. The trees begin to bear during the fifth year, and it is said that over 1½ pounds of dry rubber may be obtained from a six-year-old *Funtumia* tree. The cost of tapping the trees and shipping the product to Europe should not exceed 1s. 3d. per pound, and, if properly prepared, it is the belief of that journal that the Cameroon plantation rubber will fetch about the same price as the best Para rubber in European markets. Native labor is fairly plentiful in the rubber-growing districts and costs, including board, about £1 per month. It is likely, therefore, that rubber will continue to prove the most important product of the Cameroons for many years.

THE SITUATION IN MALAYA AND JAVA.

By a Special Correspondent.

WILL Singapore become the world's market for rubber? The question is one which is being considered throughout the rubber-producing sections of the East. The general feeling here is that the war has not so far affected very severely the prosperity of the Malay peninsula. On the contrary, in many ways it has been distinctly favorable. Still, there are some changes noticeable, socially and commercially, which create comment and on which opinions differ. Principal among them is the so-called "American invasion." Americans are settling here. They are buying land and cultivating rubber. They are here attending the auctions, and buying rubber to ship direct to America. The closing of rubber auctions in Europe has caused this, and with this has come the question which heads this paragraph.

THE AMERICAN INVASION.

Yet there are many who are inclined to resent the increasing number of Americans, and their persistence and steady progress in the trade. Some of this is rightly attributable to loyalty to the mother-country, whence most of the capital came to establish and nurture the plantation industry. Yet there is no doubt that the presence of these busy, bustling Yankees is distinctly advantageous to Singapore as a market, and the whole of Malaysia as a rubber-producing country.

A CASE OF AMERICANOPHOBIA.

However, there are persons here who think otherwise. In a recent number of the "Malay Mail" a correspondent who signs himself "Anti-Yank," after expressing a certain amount of gratitude for the winding-up of the affairs of a "too numerous alien enemy competition," has quite a little to say about the success of the American encroachment upon the rubber tire industry in the Straits, and further expresses surprise in noting the way in which goods of American manufacture are being patronized to the detriment of the British manufacturers "who were the originators of the rubber tire industry."

The only apparent reason for this, according to the writer, is a lack of patriotism on the part of his countrymen.

MONEY PLINY AND PLANTERS PROSPEROUS.

Notwithstanding the decline in the price of rubber, there seems to be about the normal amount of money in circulation, and retail traders reported a very good Christmas and New Year's trade, though, since then, general business has shown a tendency towards conservatism in some quarters. Rubber dealers are adopting a cautious policy, because of present price conditions. It is reported that at certain outstations some sizable parcels of Smoked sheet, which might be considered No. 1 in quality, have sold as low as \$100 a picul (42.6 cents per pound). Even at this price, however, it leaves a good margin of profit to the native producer.

TOO MANY TIGERS.

Planters in the Sepang district are having some difficulty in

maintaining their native labor forces, owing to a repetition of the assaults by tigers. Some native laborers have been killed, and this has caused desertions from the working forces. The planters are now demanding that the M. S. V. R. be called to exterminate these dangerous creatures.

THEFT AND INCREASED LICENSE FEES.

The increasing number of rubber thefts during the past year, and the dissatisfaction caused by the seeming inability of the police to prevent this practice, or to detect and punish the offenders, led to a proposed amendment, by which the fee for licenses granted to dealers who purchase rubber should be raised from \$25 to \$250 and the deposit from \$200 to \$2,000. This would have two effects, a lessened number of licensees, or a greatly enlarged sum available for better police protection, or both. The dealers protested, claiming that the proposed increase would interfere greatly with the entire rubber trade, but finally a bill has been rushed through, at a meeting of the Federal Council at Kuala Lumpur, by which the license fee is raised to \$100 and in place of a deposit of \$200 in cash, the licensee is required to enter into a bond with sureties for the due performance of the obligations imposed.

BATAVIAN STOCK TRADE LIST ADVISED.

The Rubber Trade Association of Batavia has sent a circular to its members, suggesting that meetings be held semi-weekly and that all free rubber on hand be listed so that no time may be lost, nor orders remain unfilled through difficulty in locating the required stock. It often happens that when an exporter receives an order from some foreign customer he frequently has to scour the entire market. Not infrequently a lot of rubber which has been offered subject to acceptance of the foreign customer has been sold before such acceptance has been forwarded. Then the exporter may be obliged to spend a considerable amount of time, and some money, to locate available rubber to fill such belated order. The semi-weekly listing of all rubber on hand, its quality and price, would be beneficial to both buyer and seller, and the circular mentioned asks for coöperation in the movement for the simplification and consequent improvement in business.

PALE CRÊPE SAMPLE STANDARDS.

All sales contracts made under the rules of the Rubber Trade Association of Batavia, as decided at a general meeting held last June, stipulated that any certain quantity of rubber purchased must be delivered with a minimum of 75 per cent Pale crêpe according to the standard samples of the society. A circular sent out by the society emphasizes that in no single instance of the established rules a word was spoken of a "color-shade," in this connection. The reason why the term "color-shade" was avoided was because the various conceptions of certain colors are so divergent. Many disputes have arisen between buyer and seller, which are not always easily adjusted, because a single standard Pale crêpe sample does not exist, and cannot be prepared.

There are three established standard samples: First quality crêpe numbers 1, 2 and 3; and these terms, and no others, are advised in selling contracts.

INTERPLANTING COCONUT GROVES WITH RUBBER.

A report comes from the Lunas Rubber Estate that owing to the continued unsatisfactory conditions of its coconut harvest the management has decided to interplant its coconut area with rubber. The estimated crop for the next financial year is 175,000 pounds of rubber and 60,000 coconuts.

A NEW DUTCH TRADING CORPORATION.

A new company, with the support of, and in conjunction with, the Netherlands Trading Co., has been formed under the name of the Holland-Ceylon Handels Maatschappij with a capital of 200 million, guilders [\$80,000,000] and will conduct important trading operations in the Far East.

- 20,722. The word DOMINION—articles of clothing. Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.
- 20,752. An illustration of a bear standing on its hind legs, fore paws at back—india rubber and gutta percha goods. Perdrion Rubber Co., Limited, 270 George street, Sydney, N. S. W., Australia.

SPAIN.

- 28,703. The words CORREA DE BALATA "VINCITOR"—rubber belting. Gonzalez Erquicia & Co., Bilbao (Vizcaya).

SOCIETY OF AUTOMOTIVE ENGINEERS.

The Society of Automobile Engineers will change to the above name on the nineteenth of this month, after which time the engineers who were formerly members of the American Society of Aeronautic Engineers, the Society of Tractor Engineers, and engineers connected with the company members of the National Association of Engine and Bolt Manufacturers will be working together to further such standardization work as shall be feasible in their respective fields, and with the welfare of the nation at this time constantly in view. A preparedness committee is now in close touch with the government officials and securing information to render such assistance as is needed from the members of this Society. Arrangements are being made for the most elaborate meeting in its history, this summer, the announcement of time and place being withheld pending development of international conditions.

GERMANY EXPECTS TO RECOVER SOUTH AMERICAN RUBBER TRADE.

A writer in the "Vossische Zeitung" recently, while appreciating the greatly increased American, Japanese, Spanish and Swiss exports to South America since the outbreak of the war, reaffirms the belief that upon the coming of peace Germany can soon recover the greater part of her trade in many fields. "The market of the rubber factories," he states, "will meanwhile have passed into American and British hands, but in view of previous experiences the opinion is held that a great part of Germany's former customers will soon have resumed relations with her."

The Canadian Consolidated Rubber Co., Limited, Montreal, Canada, issue some excellent folders. A recent one, entitled, "Two Feet," is especially attractive in make-up, and convincing in argument.

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK

MARCH has been a comparatively quiet month in the crude rubber market, with trading devoted to routine business and the supplying of small manufacturers' requirements. The uncertainty regarding the effect of war with Germany has produced what appears to be a policy of watchful waiting on the part of the heavy buying interests. Moreover, trade has been seriously obstructed by local freight embargoes and the railroad disturbance that for a time threatened the country has affected business adversely. While the volume of rubber arrivals has been about normal during the month, the recent heavy requisitions of British bottoms together with the fact that our government has notified certain shipping companies that their ships may be required, will undoubtedly have an ultimate effect on future arrivals. The shipping situation it would seem is beset with difficulties that are apparently growing worse instead of better.

Generally speaking, the demand for crude rubber has been spasmodic, resulting in minor price fluctuations that show a decline since March 1 of about 5 cents in plantations and 2 to 4 cents on Para sorts. On March 1, First latex and Smoked sheet ribbed, spot were quoted 87 cents in a strong market, with July-December at 75 cents. Upriver fine, spot was quoted 80 cents. The market softened early in the month and prices became easier until the middle of the month when a strong undertone developed, resulting in a slight price advance. The heavy buying interests, however, failed to support the prevailing prices and the market became easier later. On March 29 First latex and Smoked sheet ribbed, spot were quoted 82½ to 83 cents and July-December arrivals 73 cents; Upriver fine was quoted 77 cents. There appears to be very little spot rubber available, and interest in futures has been confined to inquiries that were quite active during the last week of the month. The general market conditions were strong and prices firm.

LONDON

Early in the month there was a marked tendency to buy and much rubber changed hands despite the fact that spot supplies were not plentiful. The bullish interest, however, was arrested by the reports of considerable rubber afloat and prices became easier. On March 5 First latex and Smoked sheet ribbed, spot were quoted 77½ cents, the market being generally firm until later in the month when values became easier and prices declined. On March 27 First latex and Smoked sheet ribbed, spot were quoted 77½ cents. An unusual feature of the month has been the variation of prices in the three principal world markets. New York's highest figure was 87 cents, that of London was 80 cents and Singapore, 74 cents. This abnormal situation is undoubtedly due to the weak financial position and shipping difficulties surrounding the Eastern markets.

London imports for January were 6364 tons; Liverpool imports for the same period were 1215 tons. For December London imports were 5150 tons and for Liverpool 1771 tons. Reexports for January were as follows: London, 4473 tons; Liverpool 976 tons against London 2421 tons, and Liverpool 368 tons for December.

SINGAPORE

At the auctions held March 2, 10, 16 and 22 the average prices obtained were as follows: First latex crepe, 70.44 cents;

Smoked sheet, ribbed, 70.23 cents. The total amount sold was 1840 tons.

COMPARATIVE NEW YORK PRICES FOR MARCH.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

The demand for commercial paper has continued fairly good through March, the best rubber names selling at 4½ to 4¾ per cent, and those not so well known 5 to 5½ per cent. The demand from our city banks has been rather light.

MARKET CABLE SERVICE FROM SINGAPORE.

The following reports of the weekly auctions held at Singapore have been cabled by The Waterhouse Co., Limited:

Date.	Crêpe Price per lb.	Smoked Sheet Price per lb.	Tons Sold.	Market.
March 2.....cents	72.25	73.10	510	There is a large demand for better grades.
March 10.....	73.95	73.95	583	There is a large demand for better grades.
March 16.....	69.70	68.42	385	Market dull and declining.
March 22.....	65.87	65.45	362	There is less demand.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [February 1, 1917]:

For the weekly rubber auction held yesterday and today the quantity cataloged was 750 tons, of which 440 tons changed hands. A steady demand was experienced, and prices show an all round improvement of approximately \$5 per picul as compared with last week's auction. The top price paid for fine ribbed smoked sheet was \$146 per picul, being \$4 above last week's best. For fine pale crêpe the top price was \$147 per picul, an advance of \$6. There was a fair demand for unsmoked sheet, for the first time for some weeks. Brown crêpes were again readily taken up at good prices. For dark crêpes and lower grades there was a good inquiry, at considerably improved prices.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in U.S.
Sheet, fine ribbed smoked	\$139 a 146	88 a 91	59.07 a 72.05
Sheet, good ribbed smoked	123 a 138	76 a 81	52.27 a 58.65
Sheet, plain smoked	110 a 128	62 a 67	46.75 a 54.40
Sheet, ribbed unsmoked	116 a 127	63 a 66	49.30 a 53.97
Sheet, plain unsmoked	111 a 117	61 a 64	47.17 a 53.97
Crêpe, fine pale	136 a 147	88 a 91	57.80 a 62.47
Crêpe, good pale	130 a 139	76 a 81	55.25 a 59.07
Crêpe, fine brown	125 a 131	75 a 77	53.12 a 55.67
Crêpe, good brown	98 a 113	60 a 67	41.65 a 52.27
Crêpe, dark	84 a 108	50 a 62	35.70 a 45.90
Crêpe, bark	65 a 94	45 a 61	27.62 a 39.95
Scrap, virgin	100 a	2/13 a	45 a 61
Scrap, pressed	70 a 91	1/6 a 1/10	29.75 a 38.67
Scrap, loose	54 a 66	1/25 a 1/11	22.95 a 40.80

* Picul = 133 1/3 pounds.

Quoted in S. S. dollars = 2/4 [56.7 cents].

THE MARKET FOR RUBBER SCRAP.

Copyright, 1917.

NEW YORK.

THE demand for rubber scrap has been of a routine nature for the past month, with buying confined to supplies needed for immediate requirements. The volume of business has been only fair, due to the restrictions placed on trading by the local embargoes and the congested conditions of the railroads. During the second week of the month the transportation situation at several important shipping points became easier and supplies moved quite freely. Considerable material was disposed of, but the consumers were soon satisfied and withdrew from the market. Then later in the month the threatened railroad strike prevented, for a time at least, the purchase of future requirements. That the rubber mills are well provided with abundant business is a well known fact, moreover heavy government orders have been recently booked so that the forecast is favorable for the rubber scrap market.

BOOTS AND SHOES. The consumers undoubtedly covered their requirements early in the month at prices around 9¾ delivered. Later the market softened, due to the arrivals of delayed shipments, and prices declined. Dealers were active during the last week, and sales at 9¼ cents delivered to the mills were reported. Trimmed and untrimmed arctics have declined ¼ cent since our last report.

AUTO TIRES. All grades have been dull and uninteresting, particularly the white G. & G. tires. Sales have been few and the volume of business small.

INNER TUBES. The lack of interest in this material is easily explained by the quiet position of the crude rubber market. Very little movement was noticed and prices firm but unchanged from a month ago.

MECHANICALS. While there was evidence of usual routine business from the rubber mills last month the situation has been quiet and prices unchanged.

London and Liverpool imports of waste and reclaimed rubber for January, 1917, were 538,400 pounds against 257,500 pounds for December, 1916. Exports for January were 1,417,800 pounds against 1,462,100 pounds for December.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917.

NEW YORK.

THE American cotton market has been well supported during the past month and prices show gradual advances since our last report. February 26, middling spot cotton was 16½ cents, and on March 18, it had reached the 18-cent mark. Later in the month the demand became more active due to various rumors of a bullish nature that on March 26, sent the price up to 19.20 cents. The grades of cotton used in the manufacture of tire fabrics costs about 1 cent a pound more than the regular sorts.

From the census report it is estimated that the available supply of American cotton for distribution during the season will approximate 14,000,000 bales, including linters. At the present rate of domestic consumption the season's requirements will be 7,000,000 bales, leaving about 7,000,000 bales for export and carry over. As a result of the unfavorable position of Sea Island and the uncertainty of the supply of Egyptian, there has been heavy buying of American peelers as a protective measure against failure of the regular supply.

EGYPTIAN COTTON. The British embargo on Egyptian cotton that went into effect early in March, applies to shipments from Egypt and England to neutral countries in British bottoms. Should the present stocks fail to carry the mills until January when the new crop arrives, there may be a serious shortage of Egyptian cotton in this market. London stocks are said to be exhausted. The situation, in case of war with Germany, would apparently be relieved by shipments being made in American bottoms. The acuteness of the market, due wholly to transportation difficulties, has resulted in higher prices for all grades of Egyptian cotton.

SEA ISLAND COTTON. The southern markets have exhibited much activity and advancing prices, due to the British embargo on Egyptian cotton. The volume of business has been large, the equivalent of 65 cents being offered for round lots. There was evidently little cotton remaining unsold by the end of the month and prices were unquotable on account of the unsettled market conditions.

TIRE FABRICS. While the general demand was more quiet than a month ago and fewer buyers were in evidence, there was much interest exhibited by the consuming trade in the present market. The doubt that now threatens supplies of Egyptian and Sea Island cotton has created an active interest in Peelers and combed peeler fabric is in demand. This is a precautionary measure on the part of the consuming trade and to just what extent American cotton fabric may be substituted for Sea Island and Egyptian remains to be seen. Seventeen, ¼-ounce, carded peeler fabric is quoted 85 to 90 cents a square yard. The other grades of standard fabrics have advanced 15 to 20 cents a pound since our last report.

DUCKS, SHEETINGS, DRILLS, ETC. The market for all these fabrics has been very active, being stimulated by government requirements that have taken precedence over all orders. The increased government business that has fallen to the rubber mills

is shown by the many calls for deliveries ahead of contract dating. A feature of the month was the heavy buying from the Canadian mills, also for government requirements, with delivery as the principal condition of sale. Spot stocks are very scarce and the mills are sold up to the end of the year. Prices have remained unchanged and very firm.

RAINCOAT FABRICS. The reported withdrawal of certain raincoat cloths cannot be verified. The demand has been steady and all fall lines are well sold up. Government business is responsible for heavy buying of certain lines and spot stocks are consequently low. Prices are steady, with few changes worth recording.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright, 1917.

NEW YORK.

THE metal market has not changed materially during the past month, and the tendency on the part of both buyers and sellers to await developments has dominated the situation. Copper has been quiet and unchanged. The strong position of lead has remained unchanged, but later in the month easier conditions prevailed. Spelter was dull and inactive, resulting in easier prices. Antimony was quiet and unchanged until late in the month when the market became stronger.

The demand for rubber chemicals has been active in all lines, but the difficulty in obtaining materials and forwarding supplies appears to be even greater than a month ago. In view of the abnormal situation, and with spot prices at almost prohibitive figures, the necessity of booking orders as far ahead as possible is apparent.

ANILINE OIL. The foreign and domestic demand has been active and supplies are low, due to the fact that there are now

comparatively few producers. The supply is hardly keeping up with the demand, and prices are from 32 to 35 cents.

CARBON BLACK. The demand against contracts has been active and stocks are small. Spot prices are nominal and controlled by second-hand interests. The market has advanced 12 to 15 cents since a month ago.

IRON OXIDE. The bright grades are very scarce, and prices have advanced 2 cents since our last quotations. There is an active demand for all grades.

LEAD PIGMENTS. The strong position of the raw material is reflected in the lead pigments. Red oxide, sublimed blue, sublimed white, basic carbonate, litharge and orange mineral have advanced in price during the month.

SULPHUR FLOUR. The firm position of the crude material and the aggravated condition of transportation has resulted in an advance in price. Sulphur flour is now selling for \$2.45 per hundredweight in carload lots.

VERMILION. Both English and Chinese grades are scarce and high in price, due to the demand and difficulty in obtaining the raw material. English vermilion is now quoted \$1.85 to \$2 a pound.

ZINC OXIDE. A new price schedule for French process zinc oxide in carload lots will take effect April 1, covering contract sales during the second quarter of this year. The prices are lower than those of the previous schedule. There is no change in the American brands of zinc oxide.

TABLE OF CONTENTS ON LAST PAGE OF READING.**RUBBER IN NATIONAL DEFENSE.**

THE United States has at last been constrained irrevocably to take her place in the battle line of democracy. Freedom of the seas, a principle of vital import to the rubber industry, is the immediate cause that rendered the policy of armed neutrality inadequate; but the great decision has a far broader significance. America realizes at last that the fight is one in which she must not fail to participate.

In his epochal war message President Wilson made it plain that this nation has no quarrel with the German people; that it has no territorial, monetary or other selfish ambitions, but as a great champion of human liberty, individual rights and the brotherhood of man, has drawn the sword—to paraphrase the words of the immortal Lincoln—"that the world shall, under God, have a new birth of freedom, and that government of the people, by the people, for the people shall not perish from the earth."

Since we must fight in defense of a cause worthy of our best traditions, indeed the greatest that ever

engaged human endeavor, let the war be prosecuted with all vigor and thoroughness, that there may the sooner be a conclusive peace. Our first contribution to the cause of world freedom will be economic. America's great wealth and vast mineral, agricultural and manufacturing resources can be drawn upon immediately, while her navy has already assumed its share in keeping open the world's shipping lanes. Meanwhile, great armies must be trained and equipped, and through the more elastic medium of wooden ships the steel tonnage that has been destroyed must be hastily replaced.

Most of the larger industrial plants, rubber mills among the first, have been placed at the command of the government; organized labor has pledged its hearty support, and operatives of all sorts have taken up military training. Such industrial preparedness is of prime importance and, profiting by the early experience of our allies, America must not sacrifice her chemists, engineers, skilled mechanics or other trained executives and workmen in the industries vital to national defense. No one can read the summary of the manifold and indispensable uses of rubber in warfare on another page and fail to realize that many rubber experts must be numbered among those exempted from enlistment. Fortunately this is recognized by the Council of National Defense, and the policy of selective conscription on the principle of universal liability to service, advocated by the War Department, is an expression of it.

Let skilled rubber men organize for home guard duty, but not in their loyalty respond too hastily to the call for volunteers and forsake the equally important mission of military equipment to which their experience better fits them. The government will call individually for those whose plain duty lies at the front, while all who remain to supply the enormous demand for many varied rubber manufactures, without which untold troops would be of no avail, will have served their country well and taken an honorable and necessary part in the world's fight for liberty and enduring peace.

MAKING AMERICAN CITIZENS IN RUBBER FACTORIES.

THE Rubber Association of America is cooperating with the Immigration Committee of the Chamber of Commerce of the U. S. A. to encourage Americanization of our foreign-born population. The movement is patriotic as well as commercial and deserves the hearty support of the rubber and allied industries. A certain result of the war will be an enormous shifting of workmen who must be replaced. Therefore, to raise the efficiency of each and every one to the utmost becomes at once a safeguard in national defense and industrially a precautionary benefit alike to employer and employee.

Happily, rubber manufacturers have long been among the leaders in welfare work, which has in recent years expanded tremendously, offering congenial occupation for the spare moments of those who had few advantages in youth. Partly an expression of the desire for maximum efficiency through advancement of men from the ranks to responsible positions, it is also in large measure an embodiment of the American spirit which welcomes the alien to our shores and encourages him to enjoy American institutions with us. The feeling grows that we owe more than a day's wage to those men and women who have chosen America as the place in which to work out their destiny and who have crossed the ocean to make it their home.

This social obligation is recognized and being met in the principal factories and many others of lesser importance. Club rooms and even club houses are being provided with restaurants, rest, reading and music rooms; auditoriums for lectures, entertainments and motion pictures; libraries of rubber and educational books and magazines; game rooms, swimming pools and sanitary conveniences; hospitals and free dental service. Outdoors there is often a field and grandstand for baseball, football and other athletic games. These benefits conserve health, promote a high moral standard, and, together with periodicals published in the interests of the employes, broaden acquaintance, keep all in touch with the news of the plant, and encourage firm spirit and team work.

Every man is urged to improve his education, and aliens are encouraged to become American citizens. Free evening instruction is provided in several instances, and foremen have instructions to tell aliens of the free evening classes of the public schools and, wherever available, of the correspondence courses of the state university extension service. Both the Y. M. C. A. and the Y. W. C. A. are active in social, religious and educational benefits, and the Boy Scout movement is claiming many of the more youthful operatives. Every man is made to understand that education means advancement and that long service is rewarded by annuity. The increase in capital stock of several companies and the reduction in par value to \$10 a share is enabling some of the workmen to invest their savings profitably, while others are embracing opportunities afforded them by their employers to buy home sites and houses on easy, advantageous terms.

The manner in which our foreign cousins are responding to these influences for betterment is very gratifying. It is to be expected, however, that enthusiasm will sometimes lag in the schoolroom after eight hours' labor in the factory. This is particularly true in English language classes, for the alien finds ours a difficult tongue to learn. Various means of stimulating renewed interest have been tried, but probably the most unique and successful is that of devoting several minutes of the class time every day to

singing American patriotic songs to piano accompaniment. To see 200 aliens representing 18 nationalities joining heartily in singing "America" is indeed an inspiring sight that augurs well for the future.

AN ASSOCIATION FOR BETTER LEGISLATION.

IN the Associated Industries of Massachusetts the Bay State has an efficient and much-needed organization. Its membership comprises most leading manufacturers of the state, including several rubber, textile, machinery and footwear firms familiar to readers of this paper, who are cooperating in bringing the influence of intimate knowledge and expert experience to bear upon all proposed industrial legislation.

The active work of the association is divided between the Central Legislative and Technical Advisory Committees. The former reads the bills, decides upon the desirable action, and refers its recommendations to the Executive Committee for approval. It maps out the line of action at hearings, and assists and directs the work until the measure is finally disposed of.

The Technical Advisory Committee organizes technical boards representing every industry and composed of men well informed about manufacturing operations, whose duty it is to supply state boards, commissions and legislative committees with facts and expert information as to the probable workings of proposed rules or codes regulating factories, to assist in drafting new and perfecting existing codes, and report on their actual workings.

That the scope may be made broader and more liberal, a Council of Associations is being organized which will eventually be composed of one representative each, from the various business organizations, such as the National Metal Trades Association, the Boot and Shoe Association, etc. By such council and concerted action it will be possible to express very nearly the thought and sentiment of the entire business community of the commonwealth for constructive and defensive purposes.

GUMSHOE MARMALADE IN GERMANY.

THE daily press of late has been favoring us with several more or less accurate pictures of the food situation in beleaguered Germany. Some of the statements appeal to reason; others do not. Certain it is that substitutes of many sorts are in daily use. Nevertheless, we can hardly credit the recent assertion that worriout gumshoes treated with nitric acid, to which are added wood pulp, artificial seeds and a little chemical flavoring, now pass there as marmalade. We agree with the writer that this vague recipe suggests neither a savory nor a toothsome delicacy, but in Germany military needs ever take first place and rubber is far too scarce to feed to the populace. Rubber scrap and fatty waste are as precious as diamonds and gold nuggets in Germany today, and it is a safe bet that every available ounce of the former is reclaimed and utilized in the manufacture of army and navy equipment.

The Indispensability of Rubber in Warfare.

THE call to arms has come. Army and navy are preparing for action. Men are of little avail without munitions and equipment, among which rubber in one form or another has become indispensable. Never until the present international conflict has this substance played such an important part. Its manifold applications in modern warfare were described in detail by many papers in volumes 51 and 52 of *THE INDIA RUBBER WORLD*, but the vital importance of the rubber industry in equipping the army, navy, air service and Red Cross, second only to arming and feeding the nation's fighting forces, warrants a summary of its many ramifications at this critical time in American affairs.

TRANSPORT.

First, we may consider the requirements of an army, prepared for conflict upon land. To-day is the day of the automobile, the motor-cycle and the motor truck; the first two for quick travel of individuals or small parties from point to point, and the last to replace mules to draw munition and commissary wagons and artillery. All these require tires of rubber, a fact in itself by which is proven the almost absolute indispensability of rubber in the progress of armies. In this one use, the manufacture of tires, rubber is to-day almost as important as food and ammunition, for on rubber tires every other necessity is borne to the front.

ARMY EQUIPMENT.

Rubberized fabrics are in urgent demand. Waterproof covers for wagons, guns and gun carriages are needed in great quantities, while ground sheets, tent coverings, ponchos, and even accoutrements are made of coated fabrics. The manufacturer of sheeted cloth will find there are many uses in the army for his product, while new demands must constantly present themselves for this class of materials. The soldier must be provided with haversack, and fastenings for the same, and here rubber and fabric are taking the place of leather. This latter material, advancing in cost as it is diminishing in supply, is fast being replaced by rubber for the soling of boots and shoes, and the claim is made that the new fiber and rubber soles have advantages not only of longer wear, but of more flexibility, and a waterproof quality not possessed by leather. Trench warfare has made rubber boots necessary to prevent the serious illness that soldiers contract in these muddy ditches.

THE AIR FLEET.

To-day fighting is done not only on the land, but in the air, on the water, and even beneath it, and aircraft, warships and submarines all require rubber in so many and varied forms that it would be but slight exaggeration to say that none of these could exist without the precious gum.

No substance has been found which can replace rubber in the manufacture of balloon fabrics. While the double fabric which forms the bags for dirigibles and "blimps" has not yet been made absolutely impervious to the passage of gases, no other material which has otherwise been considered practicable, has approached it in this particular. The wheels are rubber tired. The aviators wear rubber clothing, that they may conserve their bodily heat when in the colder and more rarefied atmosphere of high altitudes, and many of these suits are capable of acting as life preservers, if the aviator falls in the water.

Much rubber is also employed in the making of respirating apparatus, enabling the airman to breathe while at these great heights. That new invention, the stabilizer, requires rubber for insulation, packing and tubing, while every airplane uses tubing or solid rubber for cushioning the operator's body from shock, and for protecting exposed parts liable to damage in alighting.

THE NAVY.

The battleship has so many rubber requirements that only a general mention can be made. It is a habitation for many hundred men, and as such needs all the appointments of a modern hotel or dwelling, with its plumbing, its electric wiring, etc.; all the accessories of a machine shop, with its gaskets, its washers, its tubing; all the requisites of a fortress, its shock absorbers, its rubber carpeting; all the fittings of a hospital, of which more hereafter, and besides these all the essentials of a metal body floating in water, which must be watertight in all its joints, while its bulkheads must be packed as strongly as steam boilers to withstand pressure in emergencies, and, of course, large amounts of hose are necessary.

THE UNDERSEA FLEET.

Many, indeed, are the rubber requirements of ships that sail the seas, and even more numerous those of the fleet which sails below the ocean's surface. There, surrounded on all sides by water, with pressure increasing with every foot of submersion, the most exacting necessity is the packing of all joints, the use of gaskets on all hatches, around the inlets and outlets of the torpedo tubes, and the joints of the torpedoes themselves. There are many buffers for the doors, and packings to make them waterproof. There must be packing around the periscope tubes, and around the lenses in them, and cushions to protect the observer's face from jars and bruises when using these necessary tubes. These submarines are usually propelled by electricity when submerged, and much rubber is used for insulation, to prevent leakage and short circuiting. Hundreds of hard-rubber battery jars must each have its tightly fitted rubber-sealed cover, and its enclosed rubber separators, while much sponge rubber is used in the elimination of gas and acid fumes from these batteries. The crews of some submarines are provided with life-saving suits of rubber to be used in the event of disability of the vessel to rise to the surface.

THE RED CROSS.

War consists primarily in the destruction of life, but a merciful adjunct to all branches of service is the hospital, be it in the field or on shipboard. The readers of this page are acquainted with the many surgical sundries and appliances used in every hospital, which are made wholly or partly of hard or soft rubber. There is no need of their enumeration here. With our forces in action all such supplies will be needed in great quantities.

MUNITIONS MANUFACTURE.

Rubber also plays an important part in the manufacture of modern high explosives. The chemicals used in their production require careful handling, the health, and often the lives of the operatives depend upon the rubber gloves, aprons and boots they wear. And if the materials are full of danger, how much more so the explosives, when manufactured, and here the requirements regarding metal-less footwear are compulsory.

ARTIFICIAL RESPIRATION.

In all these branches of service there are vicissitudes when resuscitation may be necessary. The airman may lose his breath because of rarefied atmosphere or swift descent; the soldier may be subjected to gas attacks, the sailor to drowning, the submarine sailor to noxious fumes, and all of them to sudden severe nervous shock, which may be fatal unless artificial respiration is quickly available. The many kinds of apparatus for such purposes are all more or less dependent on rubber for tubing, gas bags and inhalers. And here might also be mentioned the gas helmets and oxygen breathing apparatus furnished soldiers likely to be assaulted by gas attacks of the enemy.

This is far from being a complete list of the various forms in which rubber is required in modern warfare. Few, if any, industries are more important than our own in the present emergency. That the rubber manufacturers of this country are prepared to fill all these requirements is a source of satisfaction in this critical period of the nation's history.

THE PRESIDENT'S CALL TO INDUSTRY.

IN that significant proclamation to his fellow-countrymen issued April 15, President Wilson emphasized the vital importance of industrial America in bringing the war to a successful conclusion. In the performance of this great task calling for large service, great efficiency and much self-sacrifice, the industrial forces of the country will become, he asserts, "a notable and honored host engaged in the service of the nation and the world, the efficient friends and saviors of free men everywhere."

It is in this spirit that the Council of National Defense has sought the active cooperation of producers of raw materials and manufacturers in meeting wartime needs promptly, adequately and well. Agreements have already been made with steel and copper producers, under which the Government is guaranteed all of these materials required for war purposes at prices far below the prevailing market. Negotiations are now in progress with oil and other producers, while an agreement with the rubber industry is foreshadowed in the appointment of a committee of rubber men to act in conjunction with the Committee on Raw Materials of the Council of National Defense. The new body, all good men and practical, consists of A. H. Marks, vice-president of The B. F. Goodrich Co., Akron, Ohio; Frederic C. Hood, vice-president and general manager Hood Rubber Co., Watertown, Massachusetts; H. Stuart Hotchkiss, vice-president General Rubber Co., New York City. Its announced purpose is to secure a speedy and adequate supply of rubber at prices which will permit no excess profits on government orders during this period of national emergency.

Agreements, such as those already negotiated, to furnish military equipment at prices which investigation shows to be reasonable, will not only insure maximum results from the nation's great war appropriations, and make purchases possible without competition, but will render it unnecessary to take over any plants for government operation. The large output of rubber manufactures already at Government disposal, indicates that the rubber industry as a whole places the national defense above profit or material advantage and will welcome any reasonable scheme for government cooperation.

PREPAREDNESS ACTIVITIES IN THE TRADE.

THE Pennsylvania Rubber Co., Jeannette, Pennsylvania, in response to the appeal of President Wilson for an increased production of foodstuffs, has turned over to its employes the extensive acreage surrounding its large plant. The company will do the ploughing and cultivating and each employe will look after the crop on his section during the season, and receive the profit when it is marketed.

Van Cleef Bros., Chicago, manufacturers of rubber cement, are utilizing a vacant space about their plant to interest their employes in raising foodstuffs. The company will lend every support possible and encourage their help, the employes to have all the crops.

Reports of the commandeering of manufacturing plants by the Government have appeared in local papers owing to activities of the five engineering associations in connection with the Naval Consulting Board, the object being to list the industrial resources of the country and insure the services of skilled men in manufacturing material for the use of the Government. Among the establishments erroneously reported to be commandeered was the

Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, of which General Manager A. W. Berresford is a member of the Naval Consulting Board. He states that of the 2,000 employes, 400 shop men and 40 in the testing room engineering and office forces are enlisted in the Reserve, and may be called upon to do Government work in this factory, but this will not interfere with the regular business, and normal shop conditions.

Reports of like nature regarding several Akron, Ohio, concerns were found on investigation to be of a similar nature, the stories of commandeering the plants resulting from the taking of inventory and stock by Federal agents. The B. F. Goodrich Co. employes to the number of 1,000 have joined this Reserve, thus pledging themselves to work on Government contracts when needed. The Goodyear Tire & Rubber Co. reports that it has arranged for classes in military training, giving all employes an opportunity to learn under the auspices of ex-army officers.

C. P. Mader, secretary, Bucyrus Rubber Co., Bucyrus, Ohio, is captain in the Quartermaster Officers Reserve Corps, and for several years has been chairman of the military committee of the Bucyrus Chamber of Commerce. A number of the employes have signified their intention of entering some branch of military service.

George E. Hall, vice-president and general manager, and J. W. Fellows, factory manager, of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, are prominently connected with the Public Safety Committee, and James H. O'Brien, superintendent, has joined the Home Guards. Over 160 employes of the company intend to enlist and 30 have already done so. A uniformed Home Guard is being organized, which will be a unit of the Cambridge Defense League.

Superintendent E. W. Dunbar, of the Apsley Rubber Co., Hudson, Massachusetts, is chairman of the Public Safety Committee of that town. President L. D. Apsley states that if the Government requires any Apsley goods these needs will have first attention, the regular customer and the profit having only secondary consideration.

The women in the making room of the Tyer Rubber Co., Andover, Massachusetts, started contributing weekly to the Red Cross and every department adopted the idea, and the result is that a large sum is sent weekly to the society. It has the financial support and cooperation of the officials of the rubber company.

The Cupples Co., St. Louis, Missouri, report that several employes have already enlisted, and that 150 young men are being instructed in military drill, the time being taken from the company's working hours.

COTTON GOODS MANUFACTURERS COOPERATING.

The committee on cotton goods industries appointed by the Advisory Commission of the Council of National Defense comprises Lincoln Grant, of Wellington, Sears & Co., chairman; W. D. Judson, of Parker, Wilder & Co., secretary; Fred. S. Bennett, of the William L. Barrell Co.; Spencer Turner and John E. Rousmaniere, of the J. Spencer Turner Co.; Fuller E. Callaway, cotton manufacturer, Lagrange, Georgia; Harry L. Baily, with Wellington, Sears & Co., and A. F. Bemis, of the Bemis Bros. Bag Co., and president of the National Association of Cotton Manufacturers. This committee has sent a letter to the cotton mills of the country asking for information about the kind of goods turned out, number of looms, etc. It is said that the replies received have not been altogether satisfactory to the committee. Chairman Grant reports that many of the mills had expressed their willingness to cooperate, but that the majority of these were not equipped to turn out the kinds of goods most needed. It is understood that about 25 mills which can make these goods have yet to express their willingness to devote their looms to making goods required by the Government.

Kelp Might Provide a Rubber Plastic.

OFF the coast of southern California, a business new to the United States, and by no means devoid of interest to the rubber industry, has sprung up, and since last July achieved national importance. It is the extraction of potassium chloride for munition manufacture and the separation of various other by-products from certain large Algae or seaweeds, particularly *Macrocystis pyrifera*, known as kelp.

Those who have followed the interesting developments in the rubber trade for the past decade will perhaps recall that six or eight years ago companies were formed both in England and America for the manufacture of rubber from kelp. Nothing came of either venture. "The India Rubber Journal" manifested no faith in the British invention, and as stated in THE INDIA RUBBER WORLD, the stock-selling circular issued by the promoters of the American company indicated so conclusively their ignorance of rubber technology that the matter was never taken seriously by the trade. The sample sent for inspection looked very much like the compounded sheet and from a physical examination seemed to be the kelp product mixed with rubber dough.

Kelp, however, abounds in a thick, gluey liquid, known as algin, which possesses many useful properties. It slightly re-

sembles gelatin, but differs from it in not coagulating to a jelly nor being precipitated by tannin; from albumin in not coagulating by

heat, and from gum arabic in being precipitated by mineral and several organic acids. Algin gum is a leathery, nitrogenous substance, alginic acid, insoluble in water, alcohol, ether and glycerin, although combining readily with the lighter alkaline metallic bases to form substances many of which are soluble. Does this not suggest the possibility that in kelp there may be a plastic which the rubber trade can use? Solutions of algin have 14 times the viscosity of starch and 37 times that of gum arabic, rendering it excellent as a glue. As it combines easily with rubber, shellac and other gums, it can be made an important ingredient of waterproofing compounds for cloth. It can also be utilized as a thickener and for fixing iron and aluminum mordants in calico printing, and for emulsifying oils and clarifying wines and spirits.

With the heavier alkaline metallic bases, algin forms insoluble compounds as pliable as gutta percha or as tough as horn, in which latter state it may be turned and polished like ivory or the ivory nut. In thin, transparent sheets it offers a substitute for parchment paper, gutta percha, gelatin, celluloid, isinglass or artificial leather. Like celluloid, too, it may be used for the manufacture of buttons, combs, knife handles, etc. Indeed, of the four small kelp concerns at San Pedro, one at present makes such articles, while another turns out pails and similar utensils from the pulp, which is also excellent for the manufacture of paper.

In coast regions the world over, wherever kelp occurs, it has long been employed as a fertilizer, and until the close of the eighteenth century, formed the chief source of the supply of potash in western Europe. Kelp salt, the residual ashes of the seaweed after separation of the potash, contains sodium sulphate, carbonate and chloride, together with small quantities of potassium sulphate, and was formerly much used in the manufacture of glass and soap, but of recent years has been valuable almost solely as a source of iodine, which is an important constituent. Some bromine is also obtainable. Thus this industry is but a reversion with improved methods to a business of bygone days.

When the European war cut the United States off from the world's supply of potash, the mines near Stassfurt, Prussia, where carnallite and *cænite* are found in abundance, American

scientists at once began to develop other sources. These minerals contain potassium and magnesium sulphate as well as magnesium chloride, and among the products obtained from them are saltpeter (potassium nitrate), the principal ingredient in the manufacture of gunpowder, and potassium chlorate, used in the arts as an oxidizing agent and essential to the manufacture of several high explosives. Both have been in such tremendous demand as to warrant the expenditure of millions of dollars in the development of the kelp industry and extensive experimental work for utilization of the by-products of potash manufacture.

Potash, or potassium carbonate, the so-called vegetable alkali, plays an important part in vegetable life, existing in all plants in varying proportions, and in various combinations with both inorganic and organic acids. When plants are burned, the inorganic constituents remain behind in the ashes, and it was by bleaching these ashes that potash was first obtained, the name being derived from the fact that the solutions from wood or other vegetable ashes were boiled down or concentrated in great iron pots.

Were potash the only consideration, this infant American in-

KELP HARVESTER SHOWING ENDLESS DRAG CONVEYORS.

dustry would be but temporary, for in peace times it can be procured from the German mines more cheaply than in any other way; but so many useful by-products are made available through its manufacture from kelp by chemical extraction rather than burning that there is good prospect that the business will continue to be profitable after the war. Another vital factor in the choice of kelp rather than other potash-yielding plants is especially favorable. No vast acreage of valuable land must be devoted to its culture; there is no expense of planting, cultivation or combating insect pests. It grows wild in the sea along rocky shores and requires only to be cut and carried ashore for refining. The harvesting and manufacturing are the only costs, and the supply is seemingly inexhaustible. Being one of those flowerless plants never having true stamens and pistils, it propagates rapidly by spores or simple cell division.

Kelp is found all along our Pacific Coast from Cedros Island, Lower California, to Alaska. The report of the Department of

Agriculture survey of these kelp beds in 1914 showed that there are available about 59,300,000 tons of kelp, if it were harvested semi-annually, or equivalent to 2,266,000 tons of potassium chloride. Our total imports of potash salts are about 1,000,000 tons, equivalent to 400,000 tons of potassium chloride.

The kelp groves are densest off Point Loma, San Nicholas Island, and San Clemente Island, due west from San Diego. The government report gives 16,000,000 tons of kelp on an area of 91 square miles from Cedros Island to San Diego, and 18,000,000 tons on an area of 97 square miles from San Diego to Point Concepcion. Thus the kelp industry has sprung up about San Diego, and the \$175,000 government kelp plant and laboratory, under the direction of Dr. J. W. Turrentine, will be built there or at San Pedro.

There are three principal firms at San Diego working in as many different ways. The Swift Packing Co. has a \$250,000 wharf and plant employing about 75 men, which is merely a temporary project for the duration of the war. The kelp is dried in nine large revolving drums by direct heat, then ground like feed, sacked and shipped for fertilizer. As 90 per cent of the kelp is water, the fertilizer yield by drying is 10 per cent.

The San Diego Kelp Ash Co. buys and sells the ash of burned kelp for fertilizer. The kelp is gathered and prepared by small independent companies or individuals, who sell the ash to the distributing company as a farmer sells his grain. The crude improvised implements with which the harvest of the sea is gathered, dried and burned, render this the most picturesque aspect of the industry, though of scant significance. Altogether about 100 of these independent workers prepare about 200 tons of ash a month, about 1½ tons of ash being produced from 20 tons of kelp.

Not these two concerns, but the activities of the Hercules Powder Co. have brought the kelp industry to the attention of the nation. This firm has expended \$2,000,000 on a great plant to extract potash from kelp for the manufacture of munitions by means of chemical solutions. It covers 30 acres, includes a 2,300-foot wharf, and employs over 1,100 men in three shifts, 50 of them being expert chemists, engineers and superintendents. The payroll is said to be \$70,000 to \$80,000 a month. There are several buildings, such as a large still house, centrifugal drier house, huge filter press house, 2,700-horsepower steam plant, and numerous great storage tanks aggregating 12,000,000 gallons, including 156 wooden tanks of 50,000 gallons capacity each, used as digesters of the pulp.

For cutting the kelp and transporting it to the plant, three curious kelp harvesters, three tugs and nine barges are employed. Because of their unique character a peculiar interest attaches to these great sea-going mowing machines for cutting at a depth of six feet under water this giant seaweed, which often grows to a length of 100 to 200 feet, or considerably more. Resembling the familiar dredge, they are twin-screw barges with great cycle knives that work on a bar like a mower in front of the vessel. As the barge moves forward the kelp is gathered up on a screen and conveyed by an endless drag to the pits of the boat, where it is ground finely and transferred to the barges to be taken to the plant. A crew of 12 men operates and lives on each harvester.

The \$20,000 harvester of the Swift Packing Co., 38 by 150 feet, differs in that the kelp, after being cut into pieces about six inches in length, is dropped into six large bins in the hold until taken to shore by the harvester itself. The mower consists of knives attached to an endless chain, and cuts a swath of 40 feet. This harvester has a capacity of 500 tons a day, although on account of unfavorable weather conditions and rough seas, which reduce the working day to four or five hours, does not average over 200 tons.

Numerous secret processes effect the change of kelp into potash, although most of the details are well known. First the macerated seaweed is allowed to ferment in great wooden tanks

for 10 days. The coarse leaves are then screened off, and the liquor is pumped into vats, where a chemical solution is added. It is then boiled to kill the bacteria and run into large sediment vats to settle. From there the liquid goes through filter presses and the mud is left on the cloth of the press, while the liquor filters through. By means of multiple effect evaporators the water is removed from the liquor without precipitating the salts. Then by means of evaporation again, in large vertical tanks with conical bottoms, the salts are precipitated from the liquor into the chambers below and scraped out with a hoe. The potassium chloride, which is the starting point for the manufacture of other potash salts, is separated from the sodium chloride, or common salt, by crystallizing first at one temperature and then at another. As the potassium chloride is more soluble in hot than in cold water, whereas the sodium chloride is about equally soluble, the potassium salt accumulates in the cool vat and the sodium salt in the hot one. After several refining processes the chemically pure potassium chloride is scraped out from the chambers below the evaporating tanks, when the usual processes of converting this into other potash salts may be begun.

Besides potash and saltpeter for the manufacture of matches

PUMPING GROUND KELP FROM THE HARVESTER INTO A BARGE.

and various explosives, acetone, for the making of smokeless powder, and also iodine, are taken from the mother liquors, while the trailings or mud from the filter presses, which retains a small percentage of potash, is sold for fertilizer. No part of the three barge loads of kelp that pass through the plant daily go to waste, for science and inventive genius have found ways to utilize everything in the composition of kelp, and the experiments now in progress by the government, the Hercules and other companies, promise to develop still further uses, some of which may be closely allied with the rubber industry.

When the war is over and munition manufacture languishes, potash salts will not be in such great demand, and a greater percentage of the output of the kelp industry will be available for other uses. Why not a rubber plastic? Meantime nearly all of the immediate and later products of this new American industry are employed by rubber manufacturers as coagulants, solvents, compounding or vulcanizing ingredients with rubber, gutta percha or their substitutes; also in waterproofing and insulating mixtures, rubber reclaiming and the manufacture of artificial leathers. Therefore, a new source tending to insure an ample supply at moderate prices is of interest in itself, aside from future possibilities.

Making Seamless and Transparent Rubber Goods.

THE manufacture of seamless and transparent rubber goods in the United States has not experienced the unusual growth that has characterized other branches of the rubber industry. In the past this has been almost wholly due to the competition of German manufacturers, who were able to undersell the American producer, and thereby control the market. Now that this depressing competition has been removed, the

have a tendency to produce blisters. The solution is made in the ordinary vertical type of power-driven churn, although recently the Universal solution churn has come into more general use.

In the preparation of crude rubber for the manufacture of transparent goods the procedure is radically different from that of ordinary seamless goods. Para, Ceylon and Ceara mixed with African rubber of good quality may be used. Pale Ceylons are very satisfactory and the Brazilian sorts, when used alone, produce slightly opaque goods, but quite nervy, while with African rubber they are both softer and clearer. Inferior rubbers are not used in the making of transparent rubber goods. As heat makes the rubber opaque, the washing process is precluded and the rubber is cut in small pieces and dissolved in benzene in a solution mixer. The heavy impurities may be strained out, but the fine particles are removed by a settling process; the time required to produce a perfectly pure solution depending on the quality of the gum and the required thickness of the solution. The dipping forms may be of wood, porcelain or

FIG. 1. MACHINES FOR MAKING DIPPED GOODS IN QUANTITIES.

manufacture of dipped goods will, doubtless, be developed to a much greater extent than ever before, and when American ingenuity is applied to this branch of the rubber business there will be small reason to fear competition from abroad. The demand for transparent and seamless rubber articles made by the dipping process has been greatly augmented during the past few years, and the production is not equal to the demand.

In this country we are accustomed to view the art of dipping as an unavoidable hand process and, therefore, there has been little advancement made in specialized dipping machines. That Germany has taken precedence in dipped goods manufacture is a well-known fact, due, without question, to the labor-saving machinery of special design used in making goods of this type. In design and construction these machines are built for both large and small production, and with every possible operation being automatically controlled in order to conserve labor and reduce the cost of manufacture.

GERMAN METHODS.

In the manufacture of nipples, according to the German practice, Upper Congo, Mozambique, Para and Ceylon rubbers are used. In order to cheapen the article, rubber substitute is often employed, but the resultant product is dull in finish and requires varnishing or enameling. Red nipples are made from Ceylon rubber, colored with sulphuret of antimony, and for black nipples Para rubber is generally used without coloring matter of any sort. Ceylon rubber is unsuited to this type of nipple, as it produces a gray-blue color in the goods.

Benzene of high volatility is recommended, as the lower grades

glass and the frames to which they are attached are all of standard size to fit the dipping machine carriers.

SCHIRM'S DIPPING MACHINES.

Seamless goods, such as toy balloons, nipples and gloves, transparent nipples, finger cots and tubes are all made on the machines

FIG. 2. MACHINES FOR MAKING DIPPED GOODS WITH MOVABLE SOLUTION CAR.

here described; however, the preparation of the solution, and the drying and final vulcanization is quite different in the production of transparent articles. The machines for dipping and drying nipples and similar articles up to 180 millimeters [7.086 inches] in length are illustrated in Fig. 1 and consist of a battery of 5 machines. The detailed description that follows applies to each machine, as they are all alike in construction and operation. Moreover, the process of dipping and drying is progressively carried on, the machines being semi-automatic and under the control of one operator.

The upper cylindrical casing encloses a horizontal shaft on

which are mounted four carriers that hold the four dipping frames. This shaft is revolved at variable speed by gearing located at the back of the machine, not shown in the illustration, and is started and stopped by a hand rod shown at the front on the left side of the casing. The lever in the center of the casing is used for turning the carrier shaft by hand when loading the carriers with the mold frames. Glass observation doors are provided in the upper part of the casing for introducing and removing the mold forms and there is also a glass window in the lower part, through which the dipping operation may be observed. Two additional glass-covered slits are located just above the lower window for observation purposes, and electric lights illuminate the interior of the casing.

The lower part of the casing is provided with doors and encloses a platform that is raised and lowered by a hydraulic ram. Two hinged covers are attached to the sides of the casing and are opened and closed automatically, covering the solution when not in use, thereby keeping it clean and preventing evaporation. A car containing the rubber solution is wheeled on the platform and the door closed. A frame holding the molds is then placed in the machine through the upper doors and attached to the carrier. The carrier shaft is turned by hand, bringing in position the second carrier to which the second dipping frame is attached, and when all four frames are in place, the doors are closed and the machine is ready for the actual dipping operation.

The speed of the hydraulic ram is controlled by a valve shown on the left of the machine, and when this is operated the ram slowly lifts the solution car and the hinged covers at the same time. After the first dipping the car is lowered and the carrier shaft turned until the wet molds occupy a vertical position. After remaining in this position for a short period to prevent the freshly-dipped molds from running, the carrier shaft is set in motion and revolved until the forms are surface dried. Then the second mold frame is dipped, raised to a vertical position and revolved until surface dried, followed by the third and fourth frames in a similar manner. When all the molds are sufficiently dried, the second dipping operation and, in fact, as many successive coatings as may be necessary, are commenced and finished in the above prescribed manner.

During the period in which this solution car is being automatically lowered and the forms revolved, the next machine may be operated, thus a skilled operator can manipulate several machines.

The drying is assisted by air heated to the proper temperature and passed through a dust removing apparatus, the circulation being regulated by suitable valves and induced by a ventilator. It is customary to devote certain machines to dipping only, and the molds, after being dipped, are removed to the machines that are used exclusively for drying purposes.

MACHINE WITH MOVABLE SOLUTION CAR.

To avoid making quantities of solution in smaller factories, where the desired output is not so great as that of the preceding machines, the apparatus shown in Fig. 2 is used. In this construction only one solution car is used that serves six machines by traveling on a track, being moved from one machine to the other by chain gearing. The hydraulic ram for lifting the solution car is operated by a hand pump and controlled by a valve shown at the front of the car. These machines possess the same mechanical features described in the machines shown in Fig. 1, and are capable of producing rubber articles 180 millimeters [7.08 inches] long. It is claimed that a skillful operator can produce 21,600 small and 10,500 large nipples on these six machines in one day.

MAKING LONG SEAMLESS GOODS.

In the manufacture of long seamless rubber articles, such as gloves, 350 millimeters [13.7 inches] long and even 450 millimeters [17.71 inches] long, the machines illustrated in Fig. 3 are used. The output of 5 machines of this type is claimed to be 3360 pieces in one day, one man being able to attend to 10 machines with a daily product of 33,600 pieces.

After the dipping process comes the edging, or bead forming operation, which, in the majority of factories, is done by hand.

The beaded goods are then placed in a moderately warm chamber and the following day they are vulcanized. The articles are cured on the molds in chloride of sulphur vapors, but thicker goods, such as nipples, etc., are first subjected to the vapor cure while on the molds, after which they are removed, turned inside out and cold cured.

As previously stated, the process of dipping and drying transparent goods is the same as in other seamless goods, but without heat, as the drying temperature should not exceed 20 degrees C. The goods are cold cured in the usual manner and afterwards dried in a cool, well-ventilated chamber.

THE EXCESS PROFITS DUTY.

Some fear exists among British rubber companies in the East that the excess profits tax may be increased and this uneasiness is not without effect on the rubber market. Companies likely to be taxed have made provision to cover excess liability, stating that part of it might be considered as a reserve to be available for distribution when the tax was withdrawn.

JAPANESE PLANTERS INVESTIGATING SUMATRA.

From the "Sumatra Post" it is learned that a representative of a Japanese association arrived on the east coast early this year, with the object of purchasing land in Atjeh and beginning rubber cultivation there.

FIG. 3. DIPPING AND DRYING MACHINES FOR LONG SEAMLESS GOODS.

Power Losses in Pneumatic Tires.

THE following abstract is from a paper by E. M. Lockwood, assistant professor of mechanical engineering, Sheffield Scientific School, Yale University. The tests were made on an apparatus for power measurement at the rear tires of an automobile, and for the purpose of measuring the internal friction losses of tires and transmission system when driven by an external source, a calibrated motor was attached to the drums. The experiments have the limitation of being made on one size of tire only, and no claim is made that the entire question of tire resistance has been solved.

The method of obtaining the rolling resistance was to anchor the car with either pair of wheels on the center of the test drums, and then rotate the latter by means of the calibrated motor. Two readings were needed, one with the car on the drums and one with the car removed, when the difference in power measures the rolling resistance of a pair of wheels. The available range of speed of the motor is from 20 to 40 miles per hour at the circumference of the drums, and its maximum power is 15 horse power. The diameter of the drums is such that 300 revolutions are equal to one mile.

ROLLING RESISTANCE AT VARIOUS SPEEDS.

One surprising result of all measurements of rolling resistance at speeds from 20 to 40 miles per hour has been the very slight increase of resistance at the higher speed.

As an example of the amount of variation of resistance with speed, the following tests are reported with readings exactly as recorded:

ROLLING RESISTANCE OF FRONT WHEELS.

FRONT TIRES.	Inflation. Pounds.	Load. Pounds.	Rolling Resistance. Miles per Hour.				Average. Pounds.
			30	—	to	40	
32 x 4 Goodyear Cord....	60	1,120	11.7	11.7	13.8	12.4
32 x 4 Fabric	55	1,145	24.1	25.0	23.5	24.4	24.25
35 x 5 Goodyear Cord....	60	2,100	33.0	33.6	34.2	33.8	33.65

These cars differed considerably in rolling resistance, but in every case the speed of the car had little or no effect on the result. Rear wheel tests were made confirming the results obtained with the front wheels, hence the conclusion from these tests that the internal rolling resistance of an automobile is practically constant at all speeds up to 40 miles per hour.

DISTRIBUTION OF POWER LOSSES.

The internal power losses of the six-cylinder Chalmers chassis have been determined in this way. The tires are 32 by 4, load on front wheels, 1,145 pounds, load on rear 1,545 pounds, tire inflation 75.

POWER LOSSES IN 6-CYLINDER CHASSIS (2,700 POUNDS).

	Pounds.	Per Cent.
Front tires only	18.2	31.2
Rear tires only	17.7	30.3
Front bearings	4.7	8.
Rear bearings and transmission.....	17.9	30.5
Totals	58.5	100.

Dividing the above four items into groups we find that the tires cause 61 per cent of the total resistance, while the axle bearings and transmission up to neutral consume only 39 per cent. The conclusion is that the tires are responsible for nearly two-thirds of the power lost in the car itself.

The above values are averages for speeds from 20 to 40 miles per hour, and, as before stated, the resistance changed little with the speed.

TIRE RESISTANCE AND PRODUCTION OF HEAT.

The discovery that 61 per cent of the internal power loss of this car is expended in the tires leads naturally to what becomes of this power.

It is probable that friction of the material within the tire structure is continually taking place, due to flexure at the con-

tact with the road. This absorption of work and production of heat is similar to the friction brake, except that the friction is produced by bending the fabric, not by sliding it.

Assuming the truth of these assumptions, it ought to be possible to calculate from the work absorbed the amount of heat generated; also the temperature of the tire surface when it reaches thermal equilibrium. The solution of this problem is worked out like a hot water radiator; or, rather, as the wheel is revolving, like a hot blast heater.

These tires have 5.83 square feet of surface, and the force of resistance at the circumference is 8.85 pounds. At a speed of 30 miles per hour there will be generated 1,810 British thermal units per hour, and to dissipate this heat to the air will require a rise of temperature of 39 degrees F. above room temperature, based on a heat transfer coefficient of 8 British thermal units per degree per hour.

This calculation was made in advance of any experiments, but was later verified by running one of the 32 by 4 tires for half an hour at 30 miles per hour, after which the car was stopped and the surface temperature taken with a mercurial thermometer. The room temperature was 70 degrees F., and the tire temperature was 107.5 degrees, or a rise of 37.5 degrees as compared with the calculated rise of 39 degrees F.

This experiment confirms the theory that tire resistance is caused by flexure of the material, and leads logically to the conclusion that resistance will be increased by under inflation and by overloading.

INFLATION PRESSURE AND LOAD.

Of the factors affecting rolling resistance, inflation pressure is perhaps the most important. Very considerable changes of resistance may be caused by moderate changes of pressure.

The load carried by the tire is also an important factor, which must be considered along with the inflation. It seems probable that for a given load there is a region of inflation below which the resistance increases very fast.

This relationship can best be shown by a series of characteristic curves, where rolling resistance is plotted against inflation

DIAGRAM SHOWING RELATION BETWEEN ROLLING RESISTANCE AND INFLATION PRESSURE.

for a number of loads. A diagram showing an incomplete series of such characteristic curves for 32 by 4 tires, is shown herewith.

The influence of inflation pressure is clearly shown in curve *A*, which represents the rolling resistance of the rear wheels under normal load with fabric tires. With reduction of inflation pressure from 80 to 30 pounds the rolling resistance increases from 30 to 45 pounds.

When the load on the wheel was reduced, the rolling resistance decreased from 30 to 25 pounds under high inflation pressure. Reduction of pressure caused an increase of resistance in this case, but not quite as pronounced as in the first curve. Curve *B* shows the rear wheel resistance under light load.

Curve *C* shows the resistance of the front wheels under load equal to that on the rear, and displays the same characteristics as curve *B*. The uniformly greater resistance of curve *B* is due to the transmission system connected with the rear wheels.

An approximate calculation of the increase of power caused by under inflation can be made from the above experiments. From the diagram the total rolling resistance at 80 pounds pressure, front and rear wheels combined, is 51.9 pounds, while the corresponding value at 30 pounds inflation is 72.5 pounds. Adding to these values the wind resistance calculated for 25 miles per hour (30 pounds), the total car resistance for the two cases is found to be 81.9 and 102.5 pounds. The conclusion is that an increase of power amounting to 25 per cent may be caused by very much under-inflated tires.

CORD VERSUS FABRIC TIRES.

Only a limited number of tests of cord tires have been made under conditions permitting accurate comparison with fabric tires.

One such comparison is shown on the diagram, curve *D*, where a cord tire, 32 by 4, was tested under exactly the same conditions on the front wheels for the whole range of pressures.

The characteristics of this cord tire are, greatly reduced resistance loss and ability to run at low inflation without much increase of resistance.

While these experiments point to the value of cord tires for reducing tire losses, more numerous and exhaustive tests are required covering a wider scope.

S. A. E. HAS A NEW MEANING.

On April 19 the Society of Automobile Engineers became the Society of Automotive Engineers, as a result of the amalgamation of the membership of the American Society of Aeronautic Engineers, the Society of Tractor Engineers and engineers of company members of the National Association of Engine and Boat Manufacturers. "Automotive" is, in a sense, a new word made necessary to describe comprehensively the various forms of self-propelled mechanical apparatus, such as aircraft, watercraft, passenger and freight motor cars and tractors of various types. This word, which is sound etymologically, has been understood and accepted by the public with surprising rapidity in view of its novelty. Both the words "automotive" and "engineer" are very emblematic of modern progress and of the most advanced types of transportation in peace or war.

A Washington office of the society will be opened in the Munsey Building in connection with the Council of National Defense as soon as arrangements can be made. This action was brought about by the closer co-operation of the society with the various Government departments, which work is increasing every day.

The society has been active in classifying its membership as to capability for Government service industrially or with the troops. Over two thousand of the members have filled out blanks indicating their experience in designing and producing engines and other parts for airplanes, motor trucks, watercraft of various types, tractors and munitions. Three or more grades of men have been classified according to the following callings: Chief engineers, assistant engineers, draftsmen, electrical engineers, superintendents, metallurgists, inspectors, apparatus testers,

laboratory engineers, truckmasters, purchasing agents, service men, tool designers, executives, chemists and fuel and lubricant engineers. Trained in the highest speed industry the world has ever known, to get results without precedent as to equipment, material or time available and to assume large responsibilities, the members of the S. A. E. are well qualified to solve any automotive problems on which the Government may desire assistance. They are quite ready and willing to do anything that will assist the United States, serving in any capacity in which their country may see fit to use them at any time.

Because of war conditions, the summer meeting of the society, scheduled to be held the last week in June at Ottawa Beach, Lake Michigan, has been called off by the Council of the society, it having been found that each day finds the engineers more and more engrossed in war activities, and correspondingly fewer of the members with spare time for such a meeting. Instead of four days at Ottawa Beach it has been decided to hold a one-day meeting in Washington, D. C., on June 25. Washington was selected because many Government departments are closely associated with the work of the society.

The United States War Department, as a result of collaboration with the Society of Automotive Engineers, has revised its specifications for military motors, on a more practical basis, and less severe in several unimportant details. For the 1½-ton trucks the specifications call for 36 by 4 inch demountable tires.

TIRE PRICES ADVANCED.

The expected advance in tire prices has arrived. For the second time since January 1, the manufacturers have felt the necessity of marking up their price schedules, on account of the extra cost of materials and labor. In January, tire prices were increased, about 10 per cent on casings and 5 per cent on tubes. The difficulty of securing raw cotton of proper quality and consequent high cost of tire fabrics, is given as the principal cause of present increase. Crude rubber prices have been high, but not enough to greatly increase manufacturing cost.

The various companies have acted independently in this advance, but in nearly every case the increase is around, or exactly 10 per cent, and this rate applies to both tubes and casings and to all kinds, including Ford sizes, pneumatic, motorcycle and solid or truck tires. The variations from this 10 per cent include Firestone tires, some of which have advanced 12½ per cent, and Goodrich Q. D. and Silvertown tires, 15 per cent. Mechanical goods have also advanced 10 per cent.

AMERICAN TIRES IN BRAZIL.

American tire manufacturers lead in the exports to São Paulo, according to the commerce reports. Before the war, France supplied most of the tires used in this market, while United States exports were less than 5 per cent. In 1915 Italy led, but had to cede her place to America in 1916.

The imports of pneumatic tires for the three years preceding 1916 and the first nine months of 1916 were:

Country of origin.	1913.	1914.	1915.	Jan. 1 to Sept. 30, 1916.
Belgium		\$62,157		
France	\$188,330	167,363	\$38,957	\$46,156
Germany	34,649	23,330		
Great Britain	777	21,510	2,702	111
Italy	46,188	8,559	186,899	166,007
United States	11,240	9,015	165,536	221,257
All others	376	2,416		
Totals	\$281,560	\$294,350	\$394,094	\$433,531

It is understood that by a recent agreement between the representatives of certain American manufacturers and European factory agents, tire prices in São Paulo, as in Rio de Janeiro, will be maintained on a fixed non-competitive basis. There is a small local production of solid tires, but as the work is done chiefly by hand the industry cannot yet compete with the imported article.

Trade Acceptances for the Rubber Goods Dealer.

By R. R. Voorhees.

TRADE acceptances are being used more and more by business houses on account of their value to both the buyer and the seller of goods. And the future will see an increasing use of these handy instruments of business. Only the larger concerns now use trade acceptances, but as their value becomes more generally known the smaller concerns will adopt them until finally they will be as familiar in the business world as are checks to-day. And for this reason it would be well for every rubber goods dealer to know just what they are, how they operate and the advantages they offer.

But before their operation is explained, it might be well to quote the definition of a trade acceptance as given by the Federal Reserve Board in one of its recent circulars, as follows: "A bill of exchange . . . drawn to order, having a definite maturity and payable in dollars in the United States, the obligation to pay which has been accepted by an acknowledgment, written or stamped, and signed across the face of the instrument by the company, firm, corporation or person upon whom it is drawn; such agreement to be to the effect that the acceptor will pay at maturity, according to its tenor, such draft or bill without qualifying conditions." And it might also be well to state that trade acceptances were created by the Federal Reserve Act.

The operation of trade acceptances is very simple. When a purchaser buys goods on time; that is, does not pay cash for the merchandise, the seller of the goods includes with the invoice a blank acceptance form, upon which has been written the number and amount of the invoice and also the date of maturity. In other words, if the purchaser buys on 30, 60 or 90 days' credit, the date of maturity will be 30, 60 or 90 days, as the case may be. If the buyer of the goods wishes to give an acceptance covering his purchase he fills in the date, signs it and designates the bank through which the amount is to be paid at maturity. This is then sent back to the seller of the goods, and if the seller so desires, he can sign this acceptance and take it to his bank, discount it and in that way obtain the money at once for goods that have been sold on time. The discount rate is smaller than it is on one name paper, since this is two name paper, both the buyer and the seller having signed it.

Of course, the advantages to the seller of the goods are most apparent. But there are real reasons why the buyer of goods should do credit buying on a trade acceptance basis instead of on the old style open account system that is now in general use.

At present, cash customers are given all the advantages in business. When they make a purchase and pay cash for it, they receive what is termed a cash discount and in the course of a year this amounts to considerable. But with the credit customer it is different. He pays the full amount of the bill because the seller of the goods is forced to wait 30, 60 or 90 days for his money and on that account cannot afford to give

any discount. But as trade acceptances come into more general use there will be a marked tendency to allow a small discount to buyers of goods who give trade acceptances for their purchases. The sellers of the goods will be able to realize on the sale at once, minus a small discount, and on this account can afford to give a discount if the buyer will give a trade acceptance.

In addition to the possibility of obtaining a discount there will be a tendency to lower the net prices of the goods purchased. As the seller of goods gets more of his customers to give trade acceptances, covering their purchases he will be able to lower the net price of the goods he sells and in that way the buyer will be given an advantage that he did not have before the use of trade acceptances was possible.

Overstocking is one of the chief reasons for failure. Quite unintentional, to be sure, but still a fact, the average dealer is

too apt to take on stock with the hope that he will be able to sell it instead of being confident that he can dispose of it. He has it in his place for a while and then, perhaps, finds that it does not sell. Much of this sort of buying soon puts him out of business. But if he gave a trade acceptance

A TRADE ACCEPTANCE PROPERLY FILLED OUT.

for everything that he bought on credit he would use more judgment in making purchases.

Giving a trade acceptance would not curtail the amount of goods that a seller would allow a purchaser to buy because by so doing the purchaser would indicate himself to be a man of business judgment who fully realized his obligations. The seller would feel that any purchases made under the new method of doing credit business were purchases of merchandise that the buyer really needed and on this account would be willing to allow the buyer to have it.

In case the buyer of the goods could not meet the trade acceptance when it was due, the seller would, in most cases, be lenient with him, since when the purchase was made, the buyer gave to the seller what he so much desired.

Some buyers feel that a trade acceptance is a note, but such is not the case. Trade acceptances can be given only for obligations arising out of the purchase of merchandise, and for old accounts or for money loaned. On the face of the acceptance is written the number and amount of the invoice, which proves that it is for merchandise that has been bought. Instead of a trade acceptance harming the giver, it really helps him by placing him in a preferred credit class and making him appear as one who wants to do business on the highest business plane.

Trade acceptances are new and many do not realize their advantages. Every rubber goods dealer will do well to ask his bank about them and to ascertain if the firms of which he buys goods use them in their business. Trade acceptances are the coming method on which credit business will be done in this country, and it is only a matter of a short time when they will be in almost as common use as checks are to-day.

Financing an Industrial Village.

By John Barnard, Architect.

WHENEVER the better housing of employes comes up for discussion, the financing of such a project so as to enable them to purchase their homes on a partial payment plan is seen to be a problem of considerable importance. How this may be done on a cooperative basis is well illustrated by Good-year Heights.

This development con-sists of 400 acres near the plant of the Rubber Co., Akron, Ohio, and a 28-acre park and athletic field affording land and water recreation facilities both summer and winter. The tract is being handsomely laid out with streets, sidewalks, small parks and playgrounds, trees and shrubs, and will eventually provide pleasant modern homes for 10,000 persons. On the 100 acres now developed 300 houses have already been built and arrangements have been made for the erection of 500 more this year. Like those previously constructed, about half of this number will be built by

sists of 400 acres
Goodyear Tire &
including Blue Pond

A PICTURESQUE SINGLE HOUSE.

provide homes within the range of every purse. Every street, however, is restricted as to minimum cost of all houses upon it.

The original cost of the land to the company and the various items of development are shown by the accompanying table:

Cost of property.....	\$30,000.00
Excavating 100,000 yards.....	27,175.00
Curb for brick pavement, 11,796 feet.....	3,538.00
Gravel roads, 36,078 square yards.....	16,235.00
Sanitary sewer system.....	21,000.00
Storm water system.....	8,000.00
Main drain.....	8,510.74
Bridge (concrete).....	9,729.66
Planting trees and shrubs.....	2,500.00
Office and engineering expense, architects, etc.....	21,000.00
Blue Pond drain.....	2,932.00
Instruments.....	445.00
Sidewalks, 265,531 feet.....	23,153.00
Grading about houses, top soil and seeding.....	13,000.00
Miscellaneous (ditches, surveyors' monuments, etc.).....	1,882.60
Curbs and gutters for gravel roads, 35,958 feet.....	21,574.00

Total cost\$210,675.00

Total number of lots averaging 50 x 110—125 feet..... 430

Thus the total cost of each lot is nearly \$500, but prices have been set at \$240 to \$760, according to desirability of location. The idea is to sell the property to employes at cost in so far as that can be estimated, and the actual payments are according to the accompanying tabulation.

Two mortgages are placed upon the property. The first, for about one-half the value, is carried by a large life insurance company, while the second, covering the balance of the purchase price, is carried by the Goodyear company. The semi-monthly payments specified are sufficient to pay off the second mortgage in 12 years and the first mortgage in 3 years more, the rate of interest being fixed at 6 per cent. Larger payments may be made or the full cash price paid if desired to save the interest. A semi-monthly assessment is made to provide for taxes as they come

Cost	\$1,984.00	\$2,682.00	\$2,288.00	\$2,699.00	\$2,801.00	\$2,808.00	\$2,845.00	\$2,896.00	\$2,998.00
Real Estate Value.....	2,480.00	3,352.50	2,860.00	3,373.75	3,501.25	3,510.00	3,556.25	3,620.00	3,747.50
Semi-Monthly Payments.....									
First 5 years.....	11.27	15.25	13.01	15.34	15.92	15.97	16.16	16.54	17.06
Next 7 years.....	7.31	9.86	8.45	9.88	10.24	10.26	10.47	10.67	11.03
Last 3 years.....	3.86	5.19	4.44	5.22	5.43	5.43	5.53	5.22	5.75
15 years.....									

contract for the company and sold to employes, and the remainder at the request of employes according to their own plans, subject to the approval of an architectural board, general architectural harmony being desirable and certain restrictions necessary to the common good of the community. Both plans have their advantages, but the former is obviously cheaper because of distinct advantages in quantity buying and distribution of materials. The architects, Mann & McNeill, have developed English cottage types of harmony and individuality, yet varying considerably in size, arrangement and constructive materials, the idea being to

due, but for its own protection the company carries all fire and tornado insurance until the full purchase price has been paid. In addition, arrangements have been made for groups of 100 employes who so desire to take out life insurance on a diminishing scale which will assure the home to dependent families in the event of the employee's death. This increases the semi-monthly mortgage payments very little, the amounts ranging from 30 cents at the age of 21 for each \$1,000 to 95 cents at the age of 55.

To prevent speculation, the payments for the first five years are based not upon the cost, but upon the real estate value, which

is 25 per cent higher. At the end of five years, however, if the worker is still with the company and has kept up his payments, the difference between the two values, together with the interest thereon, is canceled and credited to him, his payments thereafter being on the basis of the cost price.

[This is the third of a series of articles devoted to the better housing of employes.—Editor.]

TWO-FAMILY SEMI-DETACHED AND SINGLE HOUSE TYPES AT GOODYEAR HEIGHTS.

What the Rubber Chemists Are Doing.

COEFFICIENT OF VULCANIZATION AND THE STATE OF CURE.

Dr. Henry P. Stevens discusses in "The India Rubber Journal" (February 10, 1917) the paper of Dr. O. de Vries on the above topic, THE INDIA RUBBER WORLD (March 1, 1917). Doctor Stevens remarks that if physical tests on vulcanized rubber are to be of practical value in order that a decision may be made regarding the manufacturing value of any particular specimen, these tests must be carried out either on a rubber cured suitably to manufacturing conditions, or if cured beyond this stage (over-cured) there must be available some method by which the tests on the over-cured rubber may be correlated to tests on correctly cured rubber. No such method of calculation is at present available, as the necessary relationship has not been worked out between stress-strain curves and coefficient of vulcanization. A correctly cured rubber is one fully cured from the manufacturer's standpoint, not beyond that point at which aging is satisfactory. Otherwise the specimen is over-cured.

Rubber is a colloid, and shows the phenomena of hysteresis. Its physical properties at any moment depend partly on its previous history. It is therefore obvious that no conclusions should be drawn from any stress-strain curve without taking into consideration the previous history of the specimen. Dr. Stevens agrees with the statement of Dr. de Vries that "the percentage of combined sulphur is quite independent of the state of cure as expressed by the position of the stress-strain curve," but adds that the "state of cure" cannot be adequately expressed under present conditions by the stress-strain curve. It may, however, be possible when the "standard curve" or other methods are correlated to manufacturing conditions and the tests carried out on rigidly standardized lines.

Vulcanization is essentially a chemical process; so also is the subsequent decomposition of rubber which has been over-cured, and hence the proportional relationship of rubber and sulphur in combination is the best guide for a stable product, the first essential in the manufacture of rubber goods.

Messrs. Schidrowitz and Goldsborough have evidently correlated their stress-strain curve method to manufacturing conditions, as shown by their remarks on the subject in "The India Rubber Journal" (March 3, 1917).

Discussing the case in which the "coefficient" (according to Stevens) may be wrong, but the mechanical properties correct, Schidrowitz and Goldsborough note that the question at issue is whether state of cure or correct cure is to be judged by the chemical or the mechanical properties of the vulcanized article—by sulphur combined with the rubber or by the stress-strain curve. Their answer is that *ultimately* the attributes or quality of vulcanized rubber must be judged by the physical or mechanical properties.

Certain low-curing rubbers require, in order to acquire the necessary mechanical properties, a protracted cure, and in the course of such cure will combine with more than three per cent of sulphur, and in general slow curing rubbers deteriorate more rapidly than rapid curing goods, and will not age well because of the excess of combined sulphur, and possibly also by reason of the long heating necessary.

The physical and mechanical effects which vulcanization has upon rubber are shown in the clearest manner by the stress-strain curve method, and there is no other known method whereby the mechanical aspect of vulcanization can be systematically and accurately followed and measured.

Schidrowitz and Goldsborough remark in conclusion:

In view of the apparent lack of comprehension concerning stress-strain curves, we take this opportunity of briefly re-stating some of the more important points:

1. The "type" of the curve is *independent of the state of cure*. It therefore connotes inherent properties.
2. As the "type" varies for different rubbers, its determination affords a valuable method of comparison in regard to important mechanical properties.
3. We obtain a graphic representation of the progress of vulcanization.
4. We are able to cure to a definite mechanical condition, and to estimate the rate of cure necessary to attain that condition.
5. Having settled the position of the curve for a given rubber mixing we are able to control the vulcanization of the factory product.

Much else may be done with and deducted from the stress-strain curve method. In more propitious times the authors propose to recur to the subject at length.

While agreeing that stress-strain curves are of great value, intelligently applied, Dr. Stevens holds that the coefficient of vulcanization is the safest guide as to the state of cure.

VULCANIZATION BY AGENTS OTHER THAN SULPHUR.

Reviewing the recently published work of Ostromyslenski, Dr. H. P. Stevens presents some of his results in the "Journal of the Society of Chemical Industry" (February 15, 1917).

VULCANIZATION WITH NITROBENZENE.

Ostromyslenski's results (published in THE INDIA RUBBER WORLD, November 1, 1916) have not been duplicated and his claim cannot at present be accepted.

The effect of vulcanization has been obtained with mixes of rubber with di- or trinitrobenzene in the presence of bases such as litharge or magnesia without the least difficulty. Trinitrobenzene is far more efficient than dinitrobenzene. Mononitrobenzene, so far, has not given satisfactory results. Figures are given obtained with 100 parts pale sheet rubber, eight parts litharge and varying proportions of *m*-dinitrobenzene and sym-trinitrobenzene. The specimens were cured in a steam vulcanizer at 135 degrees C. for times varying from 5 to 120 minutes.

The results of the physical tests show that the products so far obtained possess relatively poor physical qualities. The best results were obtained with the larger proportion (four parts) of trinitrobenzene, but even in this case the strength as measured by the tensile product is not much more than half that obtained with a properly vulcanized rubber and sulphur compound.

The color of rubber vulcanized with nitrobenzenes is brown to black. Viewed by transmitted light in a thin stretched sheet it is yellow-brown and translucent or almost transparent. Litharge can be replaced by magnesia and probably by other basic oxides with similar results.

VULCANIZATION WITH BENZOYL PEROXIDE.

The discovery of peroxides as vulcanizing agents to replace sulphur was announced by Ostromyslenski. Of the peroxides employed, most of the experiments were made with benzoyl peroxide.

As is well known, benzoyl peroxide, like other peroxides, is very explosive, and consequently cannot be handled in the dry state. For these experiments it was used in the form of a paste with about its own weight of water. In this connection it presents no difficulty when added to the rubber on the mixing rolls, and the small amount of water added is lost by the time the mixing is complete.

In the first series of experiments three mixes were made of the same plantation crêpe rubber with the following percentages of benzoyl peroxide (reckoned dry): A, 0.33 per cent; B, 1.33 per cent; C, 6.67 per cent.

Mixings A and B gave very weak rubbers. Nevertheless the influence of even 0.33 per cent of benzoyl peroxide is clearly marked. Mix C gave the best results, the vulcanized

samples having approximately one-third the strength of a similar rubber vulcanized with sulphur in the same heat. Samples from mix *B* occupy an intermediate position. All the vulcanized samples are very pale in color, quite as pale as the original raw rubber. Those of mix *C* have a very attractive appearance. They are quite transparent and resemble some of the palest cold-cured sheet prepared from plantation crêpe.

In benzene the vulcanized mix *A* dissolves in a few hours in similar manner to raw crêpe. Mix *B* swells enormously, but does not dissolve. It remains a soft gelatinous lump in the solvent. Mix *C* behaves the same as an ordinary vulcanized rubber, swelling considerably, but retaining its original form. It may therefore be said that the change brought about by heating with benzoyl peroxide is exactly similar to that produced by sulphur and that the products formed have similar properties. The proportion of benzoyl peroxide required to give a fairly complete vulcanizing effect is similar to the proportion of sulphur which would be required for the same purpose, but the vulcanization with benzoyl peroxide is brought about in a much shorter time. Thus, in the above experiments and also in those published by Ostromyslenski, vulcanization is fairly complete in 10 or 15 minutes at 130 to 135 degrees C. with 4 to 6 per cent of benzoyl peroxide, whereas vulcanization would hardly have begun with a mix containing 5 to 6 per cent of sulphur and would require two to three hours for completion. Attempts to obtain satisfactory vulcanization with smaller proportions of benzoyl peroxide, but vulcanizing for longer periods, have not been successful. Thus, with 1.33 per cent of benzoyl peroxide better results were obtained when vulcanizing for 30 minutes than for 60 minutes. Further experiments are in progress.

ORGANIC VULCANIZING ACCELERATORS.

In a communication in the "Journal of the Society of Chemical Industry" (February 15, 1917), Dr. Spence says, regarding organic vulcanization accelerators, that, according to Ditmar, Gottlob and King, the discovery of the principle of vulcanization, whether of natural or of synthetic rubber, by means of organic catalysts dates from the disclosures of the Elberfeld Farbenfabrik in November, 1912. This is probably true so far as Europe is concerned, but not so with regard to America. Dr. Spence states that substantial proof of this assertion is to be had from an analysis of his own previously published work on the subject of vulcanization.

In the "Kolloid Zeitschrift" (volume 10, page 303-305, 1912), more than six months before the Eberfeld Farbenfabrik made application for their first patent on this subject, Dr. Spence described certain experiments, the significance of which passed apparently unobserved. The reference follows: "More than a year ago we prepared samples of two carefully chosen mixings. Both mixings were made from partially purified rubber with about 9 per cent of sulphur. In order to make the investigation as comprehensive and complete as possible, the two mixings were purposely chosen so that two quite distinct types of compound as different as possible in their properties were obtained. The first was a slow-curing compound deteriorating rapidly; the second, on the other hand, was a quick-curing mixing which we knew from experience would resist deterioration indefinitely . . . Two compounds of the same general character as No. 2 were prepared; both these compounds contained about 9 per cent of sulphur and were free from mineral compounds."

Dr. Spence then states:

As a matter of fact, the first of these two compounds actually contained 1 per cent of piperidine, the very substance referred to in the German patent of November 16, 1912. The formula for the mixing was as follows: Plantation Para, 100 parts; sulphur, 10 parts; piperidine, 1 part. Without the use of piperidine in this mixing the results given in the communication referred to would have been utterly impossible.

In regard to the discovery of vulcanization of synthetic

rubber by means of organic accelerators, also credited to Elberfeld Farbenfabrik, the vulcanization of these products by this means was actually carried out and successfully accomplished by me both for isoprene-caoutchouc and for the dimethyl caoutchouc from pinacone at a time when the large industrial concerns in Germany engaged in the study of the synthesis of india rubber were in the dark as to their lack of success in the vulcanization of their products. The proof of this assertion and the complete vindication of my position with reference to the subject in general I am content to leave over until a later date. At that time I will also bring evidence to show that even the reagents claimed by Peachey (English patent 4,263 of 1914) were known to me and had been used by me both scientifically and industrially several years before his application was applied for.

VULCANIZATION.

The following remarks on the chemistry of vulcanization are condensed from a study of the subject by André Dubosc ("Le Caoutchouc & la Gutta-Percha," January, 1917). In discussing the work of Stevens, the author amplifies his views on vulcanization, published two years ago.

The early inventors and rubber workers practiced vulcanization purely as an art, and were interested solely in the industrial results. Parkes seems to have seen a little more clearly than others the problem of vulcanization as a science. The first notable advance in the study of vulcanization was the theory of Dr. Carl Otto Weber, who held that sulphur in saturating the double bonds either of one molecule, in the case of ebonite, or of a more or less extended polymer, in the case of different qualities of soft rubber, determined and stabilized the physical properties of the crude rubber complex. Although of the greatest interest, Weber's theory was incomplete, because it did not take into account the state of polymerization of sulphur used in vulcanization, nor did it explain the function of litharge and magnesia in this connection.

Subsequently, Oswald put forward this theory that vulcanization is an absorption and not a chemical phenomenon. His views have found many adherents, somewhat displacing the well-founded chemical theory of Weber, although the latter gains confirmation by the latest work of Bysow, and of Stevens on the influence of nitrogenous products and resinous substances in vulcanization, indicating that the proteins contained in rubber are very important factors in considering the properties that rubber acquires when vulcanized. The work also of Baritt supports the new ideas of beneficial influence exercised on rubber by the proteins, hitherto erroneously considered as impurities. In fact, the proteins are now known to play the part of a catalyst in the process of vulcanization.

The effect of the addition of foreign nitrogenous substances to rubber has been studied, with positive results.

The function of rubber resins in vulcanization is important, the most striking result being the deterioration of the rubber after vulcanization, when all the resinous elements have first been eliminated. This fact is explained as follows:

It has only been possible to get the colloidal sulphur necessary for vulcanization, in the absence of resins, by a partial decomposition of the rubber which has been altered and depolymerized.

The formation of water accompanying the production of colloidal sulphur explains the need for an absorbent, like whiting, in mixtures, to prevent porous rubber.

It has been demonstrated experimentally that when rubber resins and the proteins, previously separated from the rubber, are heated at temperatures approaching those of vulcanization (120 to 150 degrees C.), it is possible completely to convert the sulphur added into sulphydric acid.

When a mixture of litharge, magnesia, oxide of zinc and sulphur is heated either in air or under oxidizing influence, metallic sulphur and sulphurous acid are constantly produced. When the latter is made to react on sulphydric acid resulting from the preceding reaction, colloidal sulphur and water are formed.

Without establishing the theory just explained, Stevens summarizes the following results of his experiments:

1. Chemically pure rubber vulcanizes badly.
2. The presence in rubber of foreign albuminoids, like caseine, facilitates vulcanization.
3. Vulcanization was facilitated by the presence of non-nitrogenous hydrocarbons, like starch.

In explanation of the phenomena discussed by Stevens, Dubosc says, that the proteins and resins acting on the sulphur generate sulphydric acid, while the oxidized rubber generates sulphurous acid. These acids react on each other and produce colloidal sulphur, which alone is susceptible of combination with rubber.

In proportion to the quantity of insolubles, proteins and oxidized rubber, a larger or smaller quantity of polymerized sulphur is converted into colloidal sulphur. The rest of the polymerized sulphur remains as free sulphur.

The whole secret of the action of the impurities of rubber and of materials like litharge consists in the transformation resulting in colloidal sulphur.

METHOD OF ANALYSIS.

DETERMINATION OF COPPER BY ACETYLENE.

METHOD by C. B. Clark, Somerset Rubber Reclaiming Works. The salt to be analyzed is dissolved in water with the addition of ammonium hydrate, and heated a short time on a water bath. Precipitation of copper acetylide is effected completely, even in the cold, by the addition to the solution of acetylene in excess. The precipitate is collected, washed and decomposed by digestion in hot dilute nitric acid. The carbonaceous residue is removed by filtration. The filtrate is evaporated to dryness, ignited and the ash weighed as copper oxide (Cu O).

This method is particularly useful for separation of zinc from copper, as the salts of zinc are not decomposed by acetylene.

CHEMICAL PATENTS.

UNITED STATES.

PLASTIC RUBBER COMPOSITION. A substitute for sealing wax comprising resin, caoutchouc, sulphur, white lead and petroleum spirit as a solvent for the resin and caoutchouc. [Ramon Castells, Barcelona, Spain. United States patent No. 1,219,536.]

SOLID TIRE. A solid elastic tire made of a composition of rubber, 34 parts; lithopone, 50 parts; sulphur, 6 parts; litharge, 2 parts; and iron oxide, 2 parts. [Arthur Nixon, Rusholme, Manchester, England. United States patent No. 1,221,083.]

THE DOMINION OF CANADA.

RUBBER SUBSTITUTE. Fish oil, sulphur, five to one, and a metallic oxide, combined by heating from 175 to 220 degrees C., and subsequent heating of mass under relatively high pressure at 155 degrees C. [Morton Gregory, Tacoma, Washington. Canadian patent No. 173,601.]

FILLER COMPOSITION FOR TIRES. A composition comprising crude rubber, 34 parts; infusorial earth, 14 parts; rosin oil, 1 part; flour of sulphur, 4 parts; air slaked lime, one-quarter part; carbonate of ammonia, 2 parts, and baking soda, 1 part. [Edward L. Sherbondy, assignor to The Aero-Cushion Tire Co.—both of San Jose, California. Canadian patent No. 173,866.]

CALIFORNIA MAGNESITE.

Magnesite is being mined near Rutherford, California. In quality it compares with the Austrian magnesite. The calcined product contains over 86 per cent of magnesia, not over 3 per cent of lime and from 4 to 7 per cent of iron and alumina. After the war calcined magnesia from this California source will probably appear in the market as a compounding ingredient.

Secretary Olsen, of the American Institute of Chemical Engineers, is sending out a notice that the ninth semi-annual meeting of that body will be held in Buffalo, New York, June 20-22.

LABORATORY APPARATUS.

AUTOMATIC PIPETTE.

THE Lowy automatic pipette presents several advantages. There is no necessity of adjusting, maintaining or manipulating the volume of liquid. This is controlled by the automatic stop cock.

The exact measured volume of liquid is automatically delivered.

Inaccuracies due to parallax and personal equation are eliminated.

There is no possibility of fingers bringing contamination to the mouth.

The pipette is exceedingly easy to manipulate. The liquid is drawn up until it just

passes the graduation mark. The stopper is turned 90 degrees. The exact measured volume of liquid is thus shut off from the excess drawn into the pipette. By again turning the stopper 90 degrees, air pressure expels the correctly measured volume of liquid out of the pipette. [Palo Co., 90 Maiden Lane, New York City.]

CHEMICALS FROM JAPAN.

According to information from the British Commercial Attache at Yokohama, the Japanese Minister for the Interior has issued an order permitting the exportation of certain chemicals from Japan. Among these are sulphur, wax, ammonium carbonate, oil of turpentine and castor oil.

CHINESE VINEGAR AS A COAGULANT.

Chinese vinegar has been suggested as a coagulant, but Professor B. J. Eaton, of the Department of Agriculture, Federated Malay States, gives it as his opinion that there is no especial advantage; as far as results are concerned, in using it in place of acetic acid. This vinegar, he states, is probably prepared by acetic fermentation from rice. It differs from English and other vinegars only in being colorless. He finds that the cost, based on the acetic acid content, is far greater than ruling prices of glacial acetic acid.

A NEW METHOD OF COAGULATING RUBBER.

An interesting discovery was recently made at the Lowmont factory in the Kalatura district of Ceylon. Ordinary rubber is prepared there with the aid of acetic acid only, or with acid and sodium bisulphate. On the Lowmont plantation 5 ounces of sodium bisulphate are put into every 25 gallons of latex and water, more or less equally mixed. The liquid is allowed to settle for 12 hours when 20 per cent of dark coagulated lumps is formed. The remaining purified latex is then strained and 5 ounces of acetic acid added to every 25 gallons, when coagulation promptly takes place. It is said that the rubber treated in this manner has, so far, almost always brought top market prices, while the dark rubber made of the lumps has brought only a few cents less than the other, if properly made.

ACETONE FROM THE MAHWA-TREE.

Although acetone is chiefly employed in the manufacture of munitions, yet its use as a solvent in the rubber industry makes it interesting to learn that a new source of this chemical has been found. In the past, acetone was extracted chiefly from wood, maize and starch, but two English scientists in Hyderabad, India, have discovered that the flowers of the mahwa tree contain a larger quantity of acetone than is present in any other vegetable substance—ten times more than in wood. The Director-General of Ordnance in India reports it to be the best source of acetone yet found.

New Machines and Appliances.

RUBBER SOLUTION MACHINE AND ASBESTOS COMPOSITION MIXER

THE adaptation of the principle of the "Universal" type of mixing machines to the construction of rubber solution and asbestos composition machines has proved to be very successful. By specially designed blades the materials to be mixed are thoroughly kneaded and kept in constant motion in the trough, resulting in a homogeneous product within a comparatively short time.

The solution mixer shown in the illustration is built in two different types, one with gears on one side that is used for medium and soft grades of rubber, and the other with gears on both sides of the trough and adapted for hard grades of rubber. The trough is made of sheet iron and the machine is provided with a hinged wrought iron cover to prevent the escape of solvent and with corners or internal lips that the material may be discharged into an ordinary sized vessel.

If desired the machine may be provided with an arrangement to drive it at a slow speed or a high speed. The slow

starts at once and is maintained by a patented system of circulation which continues without attention until the cakes are completely dissolved.

Solutions of any required strength may be made without the use of steam or compressed air and there are no moving parts requiring power for their operation. No attention is necessary other than the initial charging of the apparatus which will automatically effect complete solution of the caustic in about five hours. The dissolver can also be charged at night with the assurance that the solution will be ready for use in the morning. For hot solutions a thermo syphon attachment is provided. [The Walter E. Lummus Co., Boston, Massachusetts.]

MACHINE FOR CUTTING BEADS, BELTING AND PACKING.

The development of new machinery of special design continues to mark the steady progress being made as the rubber industry expands.

The accompanying illustration is that of a recently developed machine which may be used for cutting belting and other heavy

speed is generally used at the beginning of the operation when the material is of a stiffer consistency, and the fast speed for the end of the operation, when the material is more of a syrup-like consistency. Furthermore, the trough may be jacketed for heating or cooling purposes.

For compositions containing asbestos that are used in making Klingerit type packings a special machine is constructed. The trough of this type is made of cast iron, has a toothed saddle and the blades are protected with serrated shoes. This arrangement is of great advantage as it separates the fiber of the asbestos without breaking it. [Werner & Pfeiderer Co., Saginaw, Michigan.]

AUTOMATIC CAUSTIC SODA DISSOLVER.

In THE INDIA RUBBER WORLD of January 1, 1917, it was suggested that a process used in the textile industry could be used to advantage in rubber reclaiming plants. The pertinence of the suggestion is here shown in the illustration of an apparatus that has been designed for the use of rubber reclaimers.

The operation is entirely automatic and extremely simple. The iron drums are stripped from the cakes of caustic soda, which are placed on the grid in the hopper. The tank and dissolver is then filled with clear cold water so that the cakes are submerged to a depth of about 6 inches. Solution of the caustic

fabrics, and it is particularly adapted to cutting off the beads of worn-out tires.

The construction is extremely simple, and its operation may be clearly understood by referring to the illustration and the following brief description:

In removing the beads from clincher tires, the casing is placed upon the horizontal guides and the vertical rollers are adjusted to the inner circumference of the tire. When the treadle is depressed the revolving cutter penetrates the wall of the casing and the pressure of the collars on the cutter arbor revolves the tire and the bead is quickly removed. The tire is then reversed and the other bead cut off in the same manner. [Reichel & Drews, Chicago, Illinois.]

THE MOMENT ADJUSTABLE COMPOSITION SOLE CRAMP.

The shortage of sole leather has greatly developed the sale of composition soles that are now being manufactured both here and abroad in large quantities. The device here shown for attaching soles to boots and shoes is a timely suggestion from England, where it is used with success.

A layer of special cement with strong adhesive properties is first applied around the edges of the sole about one inch wide and allowed to dry. It is then heated, placed on the shoe and

hammered down tightly on the last. The welt grips being opened widely, the cramp is placed on the shoe and the grips fitted over the welt or middle sole. The thumb screws are then tightened and the welt pressed down against the sole with nippers or the handle of a wedge-shaped knife, making a close joint all around, and the shoe is left in the cramp for ten minutes or until the heel is benched.

The device is adjustable to the right or left shoe by moving the sole plates up or down and better results are obtained by using a last in applying soles with this appliance. [The Revolute Co., Limited, Manchester, England.]

A NEW ALLOY FOR RUBBER MOLDS.

Rubber molds cast from ABCilium metal alloy are said to be so smooth that their surfaces do not require machining, polishing only being necessary, and in some cases even this may be dispensed with.

They are, moreover, impervious to all acids used in the manufacture of rubber goods and unaffected by excessive heat or soap-stone blasting.

The thermal conductivity of this metal is even greater than that of copper, consequently an instant heating or cooling is possible. A mold made of this alloy is 70 per cent lighter than an iron mold made off the same pattern, and may be constructed lighter than iron molds now in vogue. It is claimed that cast iron tire molds weighing 1,000 pounds will weigh less than 200 pounds when made of this alloy, all factors of safety being considered. The specific gravity of ABCilium is 2.51, which is lighter than 99 per cent pure aluminum. [The A. B. C. Castings Co., Cleveland, Ohio.]

SEVEN-PLATEN BEAD PRESS.

A seven-platen bead press with large capacity and novel

construction and one that has been designed to meet the requirements of modern tire production is shown in the illustration. This is a multiple opening bead press with seven round steam platens. Attached to the press is a hydraulic elevator, the platform of which is guided on two additional columns, which are part of the press.

Attached to the elevator table is a platform supported by rods. This platform is for the operator, who rises with the elevator and removes the molds from the various openings. This arrangement saves considerable floor space, as all the molds are loaded on the elevator instead of being deposited on long operating tables, as is usually done. [Southwark Foundry & Machine Co., Philadelphia, Pennsylvania.]

dry & Machine Co., Philadelphia, Pennsylvania.

THE NEW ERA BRAIDER.

The following description of a new braider should be of particular interest to manufacturers of elastic tapes and braids, as this machine is so constructed that it is almost impossible for

oil to get on the rubber or finished braids.

Among the advantages claimed by the manufacturers are fewer and simpler parts, increased speed, ease of operating, accessibility, safety to operator, freedom from shadows and cleanliness of work.

Perhaps the most notable change is the self-lubricating feature, the entire mechanism running in oil. It is necessary, therefore, to oil only once in several months, which makes a considerable difference in production, besides saving time. All

gears are covered, reducing liability of accident and giving a better rating by liability insurance companies. The studs are cast integral with the base, and are constructed so that they allow a positive fastening of the plates or "quoits."

All gears used in the machine are cut, and the construction is such that the carriers bear directly upon the surface, and are revolved by smooth cam action in place of being knocked around. This new action allows increased speed, with less strain and breakage of the yarn.

The carrier itself is designed to accommodate all sizes and types of bobbins, and unless otherwise ordered the machines are

equipped with carriers to take a 5-inch, 2-ounce bobbin, which reduces the changes of bobbins necessary and consequent stoppage of the machine.

It will be noted in the illustration that two small uprights take the place of the usual three uprights, which reduces the shadows cast and improves the light on the work. The starting shaft is enclosed in one of the uprights, and the finished braid passes through the other, thereby protecting it from spots and stains. The former, cross-bar and take-up are all of new design. The former consists of but one piece, giving all adjustments from one point. The cross-bar is thin, and is carried in a vertical position, throwing the least possible shadow. The take-up rolls are so situated that they provide for a longer space after the braid leaves the former in which the operator can trim up the work, pull out loose ends and attend to imperfections. Take-up gears are quickly changed by the removal of a split pin, the change taking less time than is required to describe it.

A feature of the new braider is the capacity of each machine to make three numbers of braid; for instance, a 16-spindle machine will make a 16-round braid, a 13-flat braid and a 17-flat braid. This is due to the design of the carrier race and gear layout, and the change over from one number to another is made very simply by merely changing two gears and inserting the filler bar.

This braider is particularly well adapted to make elastic braids, as its freedom from superfluous oil protects the rubber. An extra fitting is supplied to regular machines for the purpose of guiding the rubber from the tension rolls. [The Era Manufacturing Co., Providence, Rhode Island.]

MACHINERY PATENTS.

MACHINE FOR REMOVING DIPPED GOODS FROM FORMS.

THE removal of toy balloons, nipples and finger cots from the dipping forms is accomplished automatically by this machine. A side elevation, partly in section, is shown in the drawing, in

which *A* is one-half of the circular table carrying the radial spring rods *B* that support a plurality of vertical form holders *C* on their outer ends. The forms are locked against upward movement when the revolution of the table brings them in operative position by a cam plate *D*. An intermittent, or step by step, motion is given to the table by bevel gearing and a ratchet wheel operated by the bell-crank lever *E*. Thus each form

is successively brought in position to be operated upon by the stripping arms *F F*. The reciprocating motion of these arms, necessary in removing the articles from the forms, is obtained by cam *G*, that raises and lowers the carriage *H*, to which the arms are attached. The arms are opened and closed by spring-controlled cams *I*, and when the machine is in operation the forms are stripped by the revolving concave composition rollers, located at the ends of the reciprocating arms. [William A. Brubaker, assignor to the Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,220,177.]

AUTOMATIC MIXING MILL.

The manual labor of cutting and rolling back the rubber jacket that forms around the front roll of mixing and warming mills is mechanically performed by this machine. The drawings repre-

sent a front elevation, partly in section, of a two-roll mixer equipped with the automatic cutting and feeding device. This comprises a feed hopper *A*, an endless apron feed not shown,

and two cutting and turning blades *B, C* that are operated vertically by screws *D, E* and laterally by lead screw *F*, driven by chain gearing from the front roll. The intermittent action of the blades is controlled by electrically-driven clutches mounted on the vertical and horizontal screws. A rotating disk controller not shown, is

provided with contact pins that make and break the electric circuit for actuating the clutches. By arrangement of the contact pins in the disk perforations the blades are operated at proper intervals, when the rubber sleeve is cut and fed back to the rolls automatically. [Robert M. Graham, Akron, Ohio. United States patent No. 1,220,221.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- 1,220,288. Fabric and hose making machine. L. A. Subers, East Cleveland, Ohio.
- 1,221,089. Paper carrier for wrapping machines. F. M. Pierce, assignor to Pierce Wrapping Machine Co.—both of Chicago, Ill.
- 1,221,349. Collapsible core. R. M. Merriman, Akron, Ohio.

THE UNITED KINGDOM.

- 16,328 (1915). Tire core. R. Bridge, Castleton Ironworks, Castleton, Lancashire.
- 16,330 (1915). Vulcanizer head. R. Bridge, Castleton Ironworks, Castleton, Lancashire.
- 16,400 (1915). Rubber mill. /S. C. Davidson, Sirocco Engineering Works, Belfast.
- 16,549 (1915). Repair vulcanizer. A. B. Low, 108 South Broadway, and I. C. Osborn, 833 Meade street—both in Denver, Colorado.
- 16,890 (1915). A mandrel for use in joining the ends of air tubes and other rubber tubes. F. H. Hall, 6 Livery street, Birmingham.
- 17,072 (1915). Hand operated rubber grater. J. Burns, 26 Waveley Road, Coventry.
- 17,181 (1915). Tire vulcanizing mold. J. H. Coffey and J. H. Coffey, 73 Jameson avenue, Toronto, Ontario, Canada.
- 103,422. Device for preserving pressure in tennis balls. F. W. Stockton, 5450 Ridgewood Court, Chicago, Illinois, U. S. A.

PROCESS PATENTS.

RECLAIMING RUBBER FROM LEATHER TREADS.

BY this process the rubber that serves to attach leather non-skid tire treads to the casing is recovered. The metal studded leather bands are removed from the casing and a certain number of these are suspended in a steam jacketed digester, into which a mixture of 3 parts of tetrachloruret of ethane and 1 part of benzine is poured. The digester is closed and heated by introducing steam into the jacket for some minutes. Tetrachloruret of ethane has the property of dissolving a considerable quantity of sulphur when warm. The liquid containing the dissolved sulphur is drawn off into a suitable apparatus, where it is recovered for further use.

The same quantity of solvent is poured into the digester and

heated for half an hour at a temperature not exceeding 120 degrees C. By the action of the solvent the rubber is separated from the leather and sinks to the bottom of the digester in the form of a pasty mass on which a jet of steam is directed, causing evaporation of the solvent. This evaporated liquid is condensed and collected to serve anew. The mass of rubber is removed through the manhole in the lower part of the digester, washed and rolled into sheets. [L. B. Becker. French patent No. 481,851.]

WASHING AND SHEETING DIFFERENT QUALITIES OF CRUDE RUBBER. Plantation rubber and fine Para or wild rubber are mixed together, passed through the washing machine in the usual way and sheeted, water being allowed to flow over the rubber during its passage between the rolls. [Erwin E. A. G. Meyer, assignor to Morgan & Wright—both of Detroit, Michigan. United States patent No. 1,218,949.]

OTHER PROCESS PATENTS.

THE UNITED STATES.

1,219,833. Method of building cord tires. R. M. Merriman, Akron, Ohio.

THE DOMINION OF CANADA.

174,208. Method of making footwear. Improvement in the art of manufacturing rubber shoes. Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of W. E. Piper, Melrose, Massachusetts, U. S. A.

THE UNITED KINGDOM.

16,226 (1915). Preparation of rubber for vulcanization. W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [Boston Rubber Shoe Co., Malden, Massachusetts.]

COLOMBIA.

1,279. Process for waterproofing cloths and skins for rubber ponchos, coats, leggings, shoes, etc. Ramon A. Vélez, Urrao, Antioquia, Republic of Colombia, South America.

MISCELLANEOUS PATENTS.

APPLYING TREAD COVERS TO TIRE CARCASSES.

IN this invention the outer layers forming the tread and side portions of the tire casing are assembled one upon the other, forming a slab that is applied to the casing by a special rolling device.

The carcass is built up with successive fabric plies and the beads applied in the usual manner with the exception, however, of the tread and fabric strips forming the outer covering. These parts are mounted one upon the other as they come from the calender, in the following order. First comes the cushion strip A, that covers the tread portion and extends part way down the sides of the carcass; then the breaker strip B and the filler strips C that abut against the edges of the breaker strip, and finally the tread strip D. A pair

of rolling devices, comprising two spherical bodies mounted in ball bearings at the ends of two co-acting arms, exert a circumferential as well as radial action in rolling the slab on the carcass. [Ferdinand F. Brucker, assignor to The Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,220,178.]

FRENCH PNEUMATIC CUSHION SADDLE FOR BICYCLES AND MOTORCYCLES.

The saddle is composed of a leather-covered cushion, in which is enclosed one or more rubber air chambers of suitable form and provided with air valves. The envelope A is attached to the

metal support B by screws C. A stout leather plate, strengthened with a sheet of ebonite, fiber or other stiff material, is inserted between the envelope and the metal support, to prevent their contact.

The air chambers are introduced into the envelope through a slit D and inflated through valve E.

When only one air chamber is used, the concave form shown in the illustration may be obtained by a compartment F, or by small stays placed between the upper and lower walls of the air chamber. [Mariani and Radaelli. French patent No. 481,673 (May 6, 1916.)]

NARROW ELASTIC WEBBING. The essential feature of this invention consists in sewing one or more rows of longitudinal stitches through the web, after it has been woven with uniform tension on the loom. [Archibald Turner, Leicester, England. United States patent No. 1,221,489.]

MOTOR AND ACCESSORY MANUFACTURERS.

At a meeting of the executive committee, board of directors and credit committee of the Motor and Accessory Manufacturers last month, a committee consisting of C. W. Stiger, Christian Girl and W. O. Rutherford was appointed to mobilize the resources, both materials and men, of the association for the purpose of cooperating with the National Government in its needs, mainly in supplying component parts of motor cars and trucks, airplanes, motor boats and tractors.

The idea of grouping the members according to the products they manufacture, having received an approving vote from 95 per cent of all the members, a committee was appointed to present a plan for such purpose, consisting of C. W. Stiger, W. O. Rutherford and L. M. Bradley.

A midseason meeting, an innovation for this association, will be held at Atlantic City, September 12, 13 and 14. Committees were appointed to perfect plans for this meeting.

PROVIDING FOR WAR DEPENDENTS.

The desirability of some uniform method of providing for the dependent families of men enlisting in the military and naval forces has resulted in considerable agitation of the matter. Some firms are paying full wages in addition to the army compensation, others are paying the difference between the army wage and that previously received by the employee, while many desire to do the proper thing but have not decided what that really is.

Secretary of War Baker has asked the Chamber of Commerce of the United States to ascertain the sentiment of the business men of the country regarding voluntary assistance, and a special committee has been appointed to take care of the matter, of which F. A. Seiberling, president of the Goodyear Tire & Rubber Co., is chairman.

The National Fire Protection Association will hold its annual meeting in Washington, May 8, 9 and 10. A large attendance is expected. Over 100 new associate members were added in March, and the list was largely added to last month.

New Goods and Specialties.

BATHING CAP NOVELTIES.

THE season for the beach parade is drawing near and this year's coterie of feminine bathers bids fair to outrival last summer's in piquancy of headgear. As beautiful colors may now be obtained in rubber as in any other material, and its pliancy and velvety texture are highly attractive. A few of the novelties of this season in bathing caps which are likely to be popular are here shown. In the top illustration the body of the cap is gathered at the sides and caught by two rosettes, a band and streamers of a contrasting color in rubber hanging loose except when the wearer goes in the water, when the streamers may be securely tied about

the head, thus adequately protecting the hair. A jockey cap of mottled rubber with a striped visor is a saucily appealing innovation, and

the lower illustration displays a square-cornered cap with a tight-fitting band and trimmings of striped rubber in contrasting shades. [United States Rubber Co., 1790 Broadway, New York City.]

ROLLER SKATE WITH RUBBER CUSHIONS.

A sidewalk roller skate, claimed to possess all the advantages of the higher priced rink skate, has two large rubber bumpers or cushions which give great resiliency, relieve the jar from the wearer when roller-skating on hard pavements or sidewalks, and materially assist in permitting a free turning axle. This skate has self-contained ball bearing wheels, two sets of bearings to each wheel, and is strongly constructed yet lighter in weight than the average roller skate. It is adjustable and will fit shoes from 8½ to 11 inches in length. [Conron-McNeal Co., Kokomo, Indiana.]

RUBBER CUSHION HEEL AS AN ARCH SUPPORT.

This arch-supporter, in the form of an extra heel, is claimed to combine the advantages of those that are built in the shoe and those that are detachable, since it cannot move about under the arch of the foot, yet can be adjusted to meet the individual requirements of the wearer. A solid cushion of rubber is permanently fastened in a steel sleeve, threaded at one end so that it may be screwed to the metal base-plate that is placed in front of the ordinary heel. A metal plate underneath the rubber cushion adds to its wearing qualities, and when the proper height of supporter is selected this resilient supplemental heel should add considerably to the wearer's comfort in standing or walking. [Peter Broadbrooks, Batavia, New York.]

THE KANGAROO REVERSIBLE HEEL.

The novelty in this heel consists in the means and method of attaching the rubber part to the leather or composition leather lift that is nailed to the shoe in the ordinary manner. No cement is necessary, thus greatly reducing the time required for attaching the heel to the shoe. The heel comprises two parts that are dovetailed together. The leather or composition part that is nailed to the heel of the shoe is provided with a central opening and beveled edges. The rubber heel, or tread, is also molded with a projecting portion, the edges of which dovetail into those of the leather lift, holding both parts firmly together. After the leather portion is nailed to the shoe the rubber heel may be easily slipped in place by hand, no further fastening being required. When worn

out a new pair may be readily applied by the wearer. Should the heels wear unevenly they can be quickly exchanged. They are also non-slipping and have no nail holes to become clogged with dirt. [David William Jameson, Newark, New Jersey.]

SHAMPOO CHAIR AND BASIN WITH RUBBER PAD.

Having the hair shampooed is generally regarded by women as an uncomfortable necessity, the neck being held in a strained position long enough to cause considerable discomfort. Various methods of alleviating the inconvenience of this operation have been devised and a recently invented chair and basin arrangement appears to offer an agreeable solution of the difficulty. This new chair to be placed about six inches in front of the basin, has a hinged back which is lowered until the head rests comfortably on a rubber neck-piece forming part of the basin. With the head in position the hair can be washed thoroughly, soap lotion being applied through a small faucet and hose at the left. A gas heater in a water compartment makes it possible to obtain hot water instantly at any desired temperature. [The Excelsior Shampoo Outfit Co., Chicago, Illinois.]

RUBBER FABRIC WATER BAGS FOR THE ARMY.

During the recent Mexican campaign a new application of rubber in army equipment was developed which may prove advantageous again. It consisted in the use of rubber fabric bags

for carrying and purifying drinking water for the troops. These bags, which were designed by the quartermaster's department, are of double texture material, the outside of heavy khaki duck, similar to army cloth, and the lining of a thinner material. This is made up into cylindrical bags about the size of a barrel and of a capacity of about 50 gallons. There is a metal hoop at the top hinged to close like a traveling bag, and, at the bottom, four taps where the contents can be drawn off into canteens. These bags are filled with water from any available source, and by means of chemicals are purified and rendered fit for drinking within a few minutes, and this water is transported in these heavy bags with other stores of supplies needed by the army.

"CORALINE" ERASERS.

A new series of rubber erasers of an attractive coral hue, doubtless suggesting the above trade name, has recently been put upon the market. These erasers appeal especially to draftsmen, since their rhomboid shape makes erasure easy without disturbing the adjacent lines or letters. The texture is soft and velvety and they are claimed to possess excellent erasive qualities. They are supplied in two sizes, No. 310, small and No. 315, large. [Weldon Roberts Rubber Co., Newark, New Jersey.]

RUBBER HEEL WITH REPLACEABLE PLUGS.

A rubber heel employing an entirely new principle as well as a new design, is here shown. Replaceable plugs of white rubber are fitted at three points into the ordinary cushion heel, as seen in the illustration, and these plugs keep the heel absolutely level, doing away with the tendency of the usual rubber heel to wear down at the edges. The plugs also prevent slipping, and although they never pull out unless intentionally removed, their movement, in and out, as the wearer walks, gives added resilience. When worn down they are easily replaced, without the use of cement, by moistening the base with vaseline or any heavy lubricant and pressing straight down into the heel with any blunt instrument. [Emery Heel Sales Co., Boston, Massachusetts.]

ELASTIC AUTO-BODY SUPPORTER.

Long rides in automobiles, while beneficial to the health in many ways, are apt to have an injurious effect if the body is not well supported, owing to the continuous jarring of the machine. Women's corsets afford such support, and for men a practical appliance is now on the market which adequately sustains the back and abdomen against this jarring motion, yet affords the absolute freedom required. This "Auto-Body Supporter" is in the form of a well-shaped elastic band of pink silk-finish thread interwoven with rubber thread. It is made 6 inches deep, in all sizes. [Sharp & Smith, Chicago, Illinois.]

TOY BALLOON WITH WIRE HOLDER AND HOOKED-DOWN VALVE.

An attractive novelty is shown in the "Perfection" toy balloon. It remains invariably upright, waving gracefully on the end of a wire holder, and is held in perfect alinement with the wire by being firmly hooked down to the valve. The advantage of this holder over the old reed and string variety is self-evident. Also, it is a simple matter to inflate or deflate the balloon by means of the valve.

To inflate, ascertain that the valve is open by pushing in gently on the wire ring or hook; these balloons inflate to 7½ inches in diameter. After inflating, pulling outward gently on the wire ring or hook will tightly close the valve. Then the hook is put through the ring in the holder and hooked into the U bend in the wire under the ring. [The Globe Rubber Co., Cuyahoga Falls, Ohio.]

HARD RUBBER PENCIL HOLDER.

A pencil holder that is practical and convenient for short lengths of pencils is made entirely of hard rubber. The holder consists of a barrel four inches long for regular pocket size, or three inches long for vest pocket and shopping bag size. A tapered, reversible pencil clutch is fitted to one end of the holder and this holds securely either hexagon or round-shaped pencils of varying diameter. A removable eraser clutch inserted in the opposite end of the holder takes a standard size erasive tip which is easily renewable. These holders are supplied completely equipped with pencil and eraser and in various styles, with fancy mountings, if desired. [Vaughn-Upton Co., Inc., 249-251 Causeway street, Boston, Massachusetts.]

THE WEILAPHONE.

A telephone booth shuts out all disturbing sounds but cannot increase the power of the voice coming from the receiver. Both these desirable objects are accomplished, it is claimed, by a simple attachment called the

"Weilaphone," shown in the accompanying illustration, in which the base, ear tips and Y-shaped holders are made of hard rubber composition, connected by soft rubber tubing. The contour of the ear pieces in relation to the face is formed and maintained by a copper wire proceeding from the Y piece upward, extending

ing a short distance in the ear pieces. By means of this wire the instrument is held in place in the ears, rendering unnecessary the use of the hands to support it. When the instrument is in use, the telephone receiver is set on a soft rubber cap on the base piece that not only supports the receiver but serves to modify the harsh sounds sometimes incidental to the use of the telephone receiver and to shut out all outside noises and vibrations, thus bringing the voice at the other end of the wire clearly and distinctly to the user of the "Weilaphone." [The Weilaphone, Inc., New York City.]

LIFE PRESERVER FLASHLIGHT ATTACHMENT.

The difficulty of rescuing people from the water at night or in a fog is readily apparent, and many lives have been lost at sea owing to the inability of would-be rescuers to see the victims or hear their cries for assistance. A newly invented life-saving apparatus, shown herewith, is specially designed to overcome this disadvantage. This device consists of a rubber bag in which is contained an electric flashlight, the whole being attached by straps or other suitable fastening means to the ordinary form of life-preserver or life-belt. The rubber fits tightly around the lens, so as to exclude water, but the body of the bag is sufficiently loose to permit operation of the contact button of the flashlight. [A. M. McGiff, 337 West Twentieth street, New York City.]

NON-SKID RUBBER HEEL AND FIBER-SOLE.

A rubber heel embodying the same non-skid angle design as the well-known tire tread of its manufacturer has recently been placed upon the market. This heel is tough wearing and springy, and the angle tread, shown in the accompanying illustration, affords a firm foothold.

Coincident with the manufacture of this heel, the company began making a fiber sole which is claimed to be an exceptionally high-grade product that can be stitched, trimmed and finished the same as leather. The same material is also made in sheets of any desired thickness for soling. Both heels and soles are supplied in black, tan or white. [The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio.]

IMPROVED FIRE HOSE CABINET.

An interesting invention for fire equipment comprises a metal hose cabinet 18 inches high, 13 inches wide and 4 inches deep, inside measurements, so constructed that as soon as the hose is drawn out of the cabinet, water begins to flow through it. Fifty feet of $\frac{3}{4}$ -inch fire hose, provided with a nozzle and so arranged that it takes up but 8 inches of the cabinet's entire width, is held in place by two steel coil springs which are covered with rubber, thus preventing all damage to the hose should it be replaced after use before it is thoroughly dry. One end of the hose is connected to an automatic, double-seated valve, locked when not in use, and seated against the pressure. When in use, this valve is seated with the pressure and the more pressure is applied the tighter it becomes.

This cabinet can be placed in any house or public building and is supplied by a water pipe connected with the house supply, affording the same facilities as a fire department. [John Egleston, Westfield, Massachusetts.]

The National Insulate Co., Inc., with offices at 1239 Broadway, New York City, is now equipped to manufacture articles made of composition materials, such as phonograph records, molded electrical parts, buttons and novelties.

EXPLOSION OF A HORIZONTAL VULCANIZER.

SEVERAL months ago a horizontal vulcanizer used for open steam curing in an English rubber mill exploded violently, blowing off the head, but, fortunately, no one was injured. The investigation that followed revealed the following facts which proved beyond all doubt that with ordinary care the accident would not have happened.

The vulcanizer was of the ordinary horizontal type, with a $\frac{3}{8}$ -inch iron shell, 4 feet 6 inches in diameter by 6 feet long. The back end iron plate was $\frac{5}{8}$ inch in thickness, flanged and single riveted to the shell with rivets $2\frac{1}{8}$ inches apart. The door was the full diameter of the pan and of $\frac{5}{8}$ -inch iron plate, dished

VULCANIZER DOOR BLOWN OFF BY EXPLOSION.

about 6 inches. It was hinged to the shell and held in place by 21 hinged bolts, $1\frac{1}{4}$ inches in diameter, fitting into slots in the angle bar and door. Steam was supplied through a reducing valve set to 45 pounds, and the usual fittings were provided, including a relief valve set to 45 pounds.

The cause of the explosion was the forcing out of the 12 lower bolts from their slots, due to the door flange being angled or sprung, the door being then forced away from the remaining 9 bolts.

The explosion was of a violent nature, the door being blown bodily off, breaking the hinge at the pan, and tearing the door flange in way of the hinge, as shown in the illustration. The reaction lifted the pan bodily and forced it back, breaking the front standard, the pan finally being held up by two of the lower bolts resting on the top of the front standard. Practically all the contents of the pan were discharged and the pan itself suffered no damage except the broken hinge.

BRITTON COMPANY TO BUILD IN OMAHA.

The Britton Manufacturing Co., Brookings, South Dakota, has decided to locate in Omaha, Nebraska, although the date when building operations on its new plant will be begun has not yet been decided upon. This company manufactures a metal-studded tire with a 10,000 mile guarantee. The Omaha factory will be equipped for the manufacture of a complete line of rubber tires, in both plain tread and non-skid types, also inner tubes, and later on the company contemplates adding to its present line other rubber articles which can be manufactured to advantage. The directors are as follows: A. O. Britton, president and general manager; George W. Cobe, H. F. Haroldson, G. J. Flittie and W. L. Montgomery.

The Editor's Book Table.

A GERMAN-ENGLISH DICTIONARY FOR CHEMISTS. BY AUSTIN M. Patterson, Ph.D. John Wiley & Sons, Inc., New York City. [5 by 7 inches, 332 pages, flexible binding. Price, \$2, net.]

THE need of a book of this kind has been keenly felt by all scientific men, whether well versed in the German language or otherwise. Germany is headquarters for technical, scientific work, and German scientific publications contain a great amount of valuable matter, some of which is difficult to understand and which the average German-English dictionary translates very inadequately. Dr. Patterson was formerly editor of "Chemical Abstracts," as well as editor of chemical terms for Webster's New International Dictionary, and thus is peculiarly fitted for preparing a work of this kind. While special attention is given to this particular need, a fairly voluminous general vocabulary is also included, in which, however, occur many words having a technical as well as a popular meaning, and this meaning is given first, although in ordinary dictionaries it may be omitted or at least not given the prominence it deserves. The book is small enough to go in the pocket, is well bound in flexible covers, and cannot fail to be of everyday use to those who read the German scientific papers, and especially the chemical ones, to keep abreast of the times.

UNIFIED ACCOUNTING METHODS FOR INDUSTRIALS. BY Clinton E. Woods. The Ronald Press Co., New York City. [Large 8vo, 466 pages, half leather. Price \$5, postpaid.]

Industrial accounting is as diversified as are industrial concerns. The need of a unified system is acknowledged by accountants themselves. Many institutions have adopted and adapted, have added to their systems item by item, until the result is complexity rather than simplicity and clarity. The author, who has been connected with prominent concerns, among them at least one large rubber company, has for 20 years been handling industrial problems of large and small industries, and this book, which is in the form of a detailed accounting system, is intended to fit into every element of an industrial or manufacturing business, of whatever size or nature. It is written for the executive, the engineer and the accountant, and presents a system which would seem exceedingly efficient. Supplementing the body of the work are nearly 100 forms for statements, cards, charts, labor accounts, analysis, sheets, inventory, etc.

THE DANISH WEST INDIES, THEIR RESOURCES AND COMMERCIAL IMPORTANCE. By H. G. Brock, Philip S. Smith and W. A. Tucker. Department of Commerce, Washington, D. C. [68 pages, illustrated. Price, 15 cents.]

Now that the Danish West Indies are no longer Danish, but are possessions of the United States, this description of them is one which will interest all classes of readers. The book gives a large amount of information condensed into a comparatively small space and treats of the geographical characteristics, government resources, business conditions, agricultural and allied industries. Several interesting illustrations, a map showing the position of these islands, and enlarged maps of the four principal ones are included.

In the chapter devoted to agriculture and allied industries no mention is made of the cultivation of rubber, but it is interesting to note that cotton is second only to sugar as a product of these islands. In 1913 some 2,000 acres were devoted to Sea Island cotton, but owing to the appearance of insect pests in the fields, and to the various difficulties experienced as a result of the European war, financial loss was threatened, and since that year cotton raising has been temporarily abandoned. Several varieties of cotton were considered by the agricultural experiment station, including "Sterling S," "Cameron 106," "Sakellarides" and "Southern Cross," and from these, many crosses and hybrids

have been evolved with the object of securing a variety which will resist the ravages of insects and which will produce a good quantity and quality of lint. It is claimed that the yield from a 4½-acre plat where careful records were kept was 5,299 pounds of seed cotton yielding 25 per cent lint, worth in Manchester, England, 34 cents a pound. This shows that cotton is a profitable crop when cultivated in commercial acreages. It is estimated that there are about 5,000 acres on the south side of the island of St. Croix that might be profitably cultivated.

COMMERCIAL TRAVELERS IN LATIN AMERICA. BY L. DOMERATZKY. Government Printing Office, Washington, D. C. [42 pages. Price, 10 cents.]

This pamphlet, which is No. 35 of the Tariff Series, published by the Bureau of Foreign and Domestic Commerce, Department of Commerce, is certainly a valuable compilation of facts which are absolutely necessary to be known by all business houses that contemplate extending their trade to Latin America by personal representatives. It gives the regulations in each country which apply to the commercial traveler—the documents he should take with him; the customs treatment of his samples; the duties on advertising matter and such miscellaneous information as passports, buying seasons, expenses, and the like. Each country is treated separately. All countries in Central and South America are included, as well as Cuba, Haiti and the Dominican Republic.

STANDARD METHODS OF CHEMICAL ANALYSIS. EDITED BY Wilfred W. Scott. D. Van Nostrand Co., New York City. [6 by 9 inches, 894 pages, illustrated, cloth. Price, postpaid, \$6.]

This is a compilation of carefully selected methods of technical analysis that have proven of practical value to the professional chemist. Mr. Scott, who is research chemist of the General Chemical Co. and was formerly chief chemist of the Baldwin Locomotive Works, is the author of many chapters and has been assisted in the preparation of the book by a large number of eminent chemists, each somewhat of a specialist in his own particular line of analysis. Each chapter is devoted to one element, and is arranged according to the physical properties, detection, estimation, preparation and solution of the samples, separations and methods. The chapter on "Sulphur" contains 28 pages and 6 illustrations. Among articles of interest is one on the determination of antimony in rubber goods. The book is one which may well find a place in the library of the analytical chemist, where it is likely to be of frequent use.

PURCHASING, ITS ECONOMIC ASPECTS AND PROPER METHODS. By H. B. Twyford. D. Van Nostrand Co., New York City. [6 by 9 inches, 252 pages, 112 charts, diagrams and forms. Price, \$3, net.]

Equal to if not greater than any other department of modern industry is that of the purchasing agent. All other branches of a mercantile or manufacturing plant may be efficient but if the goods and materials are not of the right kind and quality or not bought at right prices, that establishment cannot succeed. The author of this work has a wide experience in manufacturing, engineering and electrical railway industries, and the book shows most effectively the results of this experience. The work is divided into several sections, starting with purchasing in its widest phase, the art and ethics of buying being considered. The personnel of the purchasing department is explained, showing the organization and the duties of each of the workers in that department. Following this is a description of the operation of the purchasing department, the method of handling invoices, the operation of stores, all of these being fully described and forms shown for use in each division of the department. Diagrams through the book show the progress of an order from the time the requirement is reported to the purchasing agent, until the purchase is completed. These diagrams run from a simple

routine in the small business to the complex and more highly perfected systems of great industries. Many points brought out in each chapter are of sufficient value to render the book highly useful to the man who buys, whether he be in a large organization or simply running a small business.

CHEMICAL ENGINEERING CATALOG. THE CHEMICAL CATALOG Co., Inc., 1 Madison Avenue, New York City. [9 by 12 inches, 288 pages, cloth.]

This book is in the nature of a compilation of catalogs of concerns which supply chemical engineering equipment, machinery, chemicals and supplies. It is intended to supersede a large mass of printed matter issued by individual manufacturers and is classified and indexed so that it furnishes in a small compass a large amount of information of value to chemical engineers, chemists and manufacturers in any way connected with chemical industries. The classified index is confined to 75 or 80 pages, the rest of the book being in the nature of condensed catalogs of a large number of concerns identified with the trade. This catalog is not sold but is loaned to those interested in the chemical and allied industries and is approved by a committee representing the American Institute of Chemical Engineers, the American Chemical Society and the New York Section of the Society of Chemical Industry.

ANNUAL REPORT OF THE INDUSTRIAL COMMISSION, 1915. NEW York State Department of Labor. [Octavo, cloth, 417 pages.]

Every large employer of labor in New York State will find much of interest in the annual report of the Industrial Commission published by the Department of Labor. Its ten parts are devoted to the general report of the Commission and the more detailed reports of the several bureaus, including that of Inspection, Workmen's Compensation, Mediation and Arbitration, Statistics and Information, Employment, Industries and Immigration, Industrial Code and Fire Hazards, Boilers and Explosives. Many opinions of the attorney-general construing the labor laws constitute the final part.

New York is among the 24 states which, like most European countries, maintain public employment offices. The records of this bureau for the year ending September 30, 1915, show 22,856 persons applied for by employers, 49,554 situations wanted, 26,641 persons referred, and 13,391 positions reported filled. There are 26 occupational groups under males and 8 under females. Factory workers, both male and female, include rubber and allied products workers, while male general laborers include rubber and allied products laborers.

OCRE DE HOJE E DE AMANHÃ. A COMMUNICATION addressed to the "Sociedade Nacional de Agricultura" during the session of November 19, 1916, by J. Virgolino de Alencar. Published by "Jornal do Brasil," Rio de Janeiro, Brazil.

In this communication the author strongly urges the encouragement of earnest and scientific cultivation of the *Hevea* in Acre, and to this end requests the above society to aid by spreading the necessary information and by interesting the right kind of men to undertake such planting. He points out that superior qualities of the true *Hevea Brasiliensis*, found in Acre and vicinity, deteriorate more or less when it is transplanted to other localities. In connection with this species especially he calls attention to the unscrupulous methods of tapping by which these trees, in a very short time, are either killed or rendered unproductive. He pleads for such supervision and regulation as will suppress this evil and gives warning that such practices, due to greed or general ignorance, are factors which make it possible for the Orient to compete successfully with Brazil.

A report of the author's plantation in Rio Yaco by the agricultural authorities of Alto Purus, and an estimate of the gains to be derived from a plantation similar to that of Dr. Alencar are final arguments for planting rubber in this natural habitat of the *Hevea*.

NEW TRADE PUBLICATIONS.

THE tire repair man can get many valuable ideas and suggestions from the 1917 catalog of the Williams Foundry & Machine Co., Akron, Ohio, which has just been issued. It not only describes and pictures the full line of tire-making and tire repairing machines, tools and appliances manufactured by this house, but also contains a great amount of information of practical value to those engaged in this line of business.

* * *

The B. F. Goodrich Co., Akron, Ohio, has issued an attractive 40-page pamphlet describing its rubber goods for the lumber industry, which is carefully compiled, handsomely printed and profusely illustrated. It is not a mere catalog, but to a certain extent a handbook of interesting information on this subject.

* * *

Health insurance is one of the proposed factors of modern efficiency. Facts in respect to compulsory health insurance, as presented at legislative hearings in New York and Massachusetts, are succinctly given in a pamphlet sent by Magnus W. Alexander, Lynn, Massachusetts.

* * *

Werner & Pfleiderer Co., Saginaw, Michigan, manufacturer of mixing and kneading machinery, is sending out one of the handsomest and best arranged catalogs of this class of goods which we have seen. The book contains 84 pages, each printed in two colors, the cover, in full colors and handsomely embossed, appropriately showing a brawny workman holding one of the peculiar shaped mixing blades from the company's machines. Each digester, dissolver, washer, kneader or mixer is shown in half-tone from carefully retouched photographs. Much information regarding dimensions, capacity and special adaptation is given, also guarantees and conditions under which these machines are sold, and other matter of interest to rubber cement and rubber goods manufacturers.

* * *

A neat desk or wall calendar has been received from the Xylos Rubber Co., Limited, reclaimer, Manchester, England. In an appropriate setting are cards for days, months and dates, prominent and distinct, while the background contains advertising information of the concern's specialties.

* * *

The United States Rubber Co., New York City, has adopted the name "Keds" for its lines of canvas shoes with rubber soles, and is sending out some excellent window display matter for advertising these goods. A cut-out of paper represents a young man and a young woman, each wearing these shoes, between and beyond them a view of a tennis court; these to be placed across the front of the window. The cut-outs are so gummed that by moistening they can be made to adhere to the window. There are attractive and odd-shaped window cards for display with shoes of this character and a diagram explains the proper arrangement of all these in the window. The advertising matter is in brilliant natural colors, and the whole display is likely to be of advertising value to the storekeepers who may utilize it.

* * *

"Mobilizing Money for War" is the title of a 12-page pamphlet being distributed by the Guaranty Trust Co. of New York, intended to show the reason for and the necessity of investing in the great government loan for national defense to which the public will soon be given an opportunity to subscribe. It points out that the United States is the richest country in the world to-day, its national assets equaling the combined wealth of Great Britain, Russia, France and Italy, and that the whole nation must enlist its wealth as well as its manhood to win the war.

Interesting Letters from Our Readers.

OUR GROWING RUBBER TRADE WITH THE DUTCH EAST INDIES.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—According to the present trend of the trade the Dutch East Indies promise to become a greater source of rubber for American manufacturers than ever before. The demand for smoked sheet from Java and Sumatra plantations, always good, has increased considerably of late because of obstacles placed in the way of American buyers in the British colonies. The increasing war export duty, which has no counterpart in the Dutch colonies, is perhaps the principal reason, although the permit, which must be procured of the Tire and Rubber Committee in London, is an important factor because it delays and renders shipments so uncertain. It is to be hoped that with the United States in arms shoulder to shoulder with England, the American rubber trade may be relieved of some, at least, of the many formalities which have attended all rubber imports during the war.

England cannot well afford to lose her largest rubber customer, which consumed about 80,000 tons of plantation rubber in 1916, for which an average price of 70 cents a pound or \$1,568 a ton was paid. The year's total business, therefore, aggregated \$125,440,000, and as the profits averaged 45 cents a pound, Malayan planters are \$80,640,000 the richer thereby. The Dutch rubber production is increasing steadily, however, and the acreage and bearing figures of the Growers' Association of Batavia indicate that it will reach 120,000 tons annually in 1919, which is 5,000 tons more than the total consumption of the United States in 1916. A more considerate arrangement with America is the only thing that will prevent a still further transfer of trade to the Dutch colonies. This is shown conclusively by the fact that although prices have risen several cents above those in Malaya for similar grades, American buying still continues good.

OBSERVER.

Boston, April 23, 1917.

A PACIFIC MERCHANT FLEET.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Every American of spirit welcomes the plan to build 3,000 wooden cargo ships of 3,000 tons each, 1,000 of them to be in service within 18 months. It does the heart good to see activities about the old New England shipyards again, and to know that many others are to be opened elsewhere. By such means the "Stars and Stripes" will once more become a familiar flag in the principal ports of the world, and this is quite as it should be. These wooden makeshifts can later be replaced by steel ships and, as THE INDIA RUBBER WORLD has repeatedly asserted, the commerce of our great nation must never again be allowed to depend upon foreign bottoms.

A ship flying the American flag every three miles, and later every mile, between America and England or France is indeed a prophecy to stir the imagination, but are we not forgetting the Pacific in our efforts virtually to bridge the Atlantic? Our duty to provision, munition and otherwise supply neutrals and the nations engaged in our common cause is plain, but to do so entails the importation of great quantities of raw material, much of which comes or might come to our Pacific coast.

No thinking person doubts but that ruthless submarine warfare will presently be extended to our Atlantic coast, so that unavoidable ship losses in the export of manufactures will make it essential to conserve tonnage in imports to the very maximum. The increasing dependence of the United States upon the tropics for raw materials and foodstuffs not produced in this country is

shown by the enormous imports of tropical products during the fiscal year 1916, amounting to \$1,060,850,416, of which \$304,000,000 was rubber. Much of this vast total comes from the East or foreign Pacific ports, and during the war can be brought to San Francisco or Seattle more safely than to Atlantic coast cities. Moreover, high cargo and insurance rates and the losses by submarine attack, certain to come, will render transcontinental freights relatively less formidable.

During 1916 about 80,000 tons of rubber, or 27 cargoes of 3,000 tons each, came from the East and had it become necessary might have been entered at Pacific coast ports. Our exports to Middle and Far East countries are constantly increasing, and Russian events promise to render Vladivostock one of our great foreign markets, so that there will be cargoes to go both ways. American consumers to-day are dependent upon British and Japanese ships to bring rubber from Singapore, Colombo and Penang, via Hong Kong, where it is transferred at a considerable loss of time and labor. Submarine losses have reduced the British service, and although a new service has been inaugurated by two Dutch ships between Batavia and America, the situation is not greatly relieved. Because of the lack of ships the cargo rate to America from Hong Kong had early this year been increased from \$24 to \$30 a ton.

Let a goodly number of our proposed fleet of wooden merchantmen be built in Pacific coast yards and put into service to the Far East, that the American flag may become as familiar there as in the days when ships from New England seaport towns were known the world around.

A RUBBER IMPORTER.

San Francisco, April 16, 1917.

JUDICIAL DECISIONS.

CONSOLIDATED RUBBER TIRE CO. vs. THE B. F. GOODRICH CO.; CONSOLIDATED RUBBER TIRE CO. vs. REPUBLIC RUBBER CO. These were suits in equity on exceptions to the report of the master, brought before the District Court, N. D. Illinois, E. D. It was held that the master's recommendation of five cents a pound as a reasonable royalty should be approved; furthermore, according to precedent, the law read that a licensee of part of the patent rights in a certain territory, or even in the whole country, cannot sue in his own name. The decision was that the reports of the master in each case should be approved, and all objections and exceptions thereto overruled. [Federal Reporter, Vol. 237, page 893.]

UNITED STATES CUSTOMS DECISIONS.

The United States Court of Customs Appeals, March 26, 1917, rendered the following decision relating to raincoats in the case of True Fit Waterproof Co. v. United States. Goods made by cementing with rubber a cotton cloth to a cotton and wool cloth, and goods made by cementing with rubber a cotton and silk cloth to a cotton and wool cloth, the rubber in each case being negligible in value, are composed in chief value of cotton, wool, or silk, according to which represents the greatest value as yarn, plus its proportion, on the basis of quantity, of the cost of weaving and other expenses incurred in making the cloth and bringing it to the condition it had immediately prior to its combination with the other materials in order to form the goods in question. For this purpose that cloth which is composed in chief value of one of these fibers should not be regarded as made entirely of it. Raincoats made from such goods are dutiable under paragraphs 256, 266, or 291, given below, according to the material of chief

value as found by this rule, and not as wearing apparel not specially provided for (par. 261).

Paragraph 250. Clothing, ready-made, and articles of wearing apparel of every description, composed of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, or of cotton or other vegetable fiber and india rubber, made up or manufactured, wholly or in part, * * * and not otherwise specially provided for in this section, 30 per centum ad valorem; * * *.

Paragraph 260. All articles made from cotton cloth, whether finished or unfinished, and all manufactures of cotton or of which cotton is the component material of chief value, not specially provided for in this section, 30 per centum ad valorem.

Paragraph 291. Clothing, ready-made, and articles of wearing apparel of every description * * * made up or manufactured wholly or in part, and not specially provided for in this section, composed wholly or in chief value of wool, 35 per centum ad valorem.

* * *

Rubber-faced card cloth, reported by the appraiser to be in chief value of cotton and classified at 30 per cent ad valorem, was protested by Ashworth Bros., Boston, Massachusetts. It was found that rubber is the component material of chief value in the card cloth here in question and therefore dutiable as manufactures of rubber at 10 per cent. [No. 40,712. Before Board 2, March 23, 1917.]

* * *

SHELDON & Co. v. THE UNITED STATES. The chicle latex having been drawn from the tree and coagulated by artificial heat into hard chunks in Mexico, shipped to Canada and there ground and dried, the grinding and drying bearing no relation to transportation and being a process in the manufacture of chewing gum known commercially as desiccated chicle, is dutiable at 20 cents per pound. [United States Court of Customs Appeals, April 2, 1917.]

TRADE-MARK DECISIONS.

PRESIDENT SUSPENDER CO. v. MACWILLIAM. The facts in the "President" suspender case are as follows: The defendant registered a trade-mark for suspenders and shortly thereafter patented certain features of the particular article to which this mark was applied. After the grant of the patent the plaintiff was given an exclusive license to manufacture and sell the suspenders during the life of the patent. Upon the expiration of the patent the defendant commenced to use the mark and the plaintiff brought suit in the district court. The decision was in favor of the plaintiff and the defendant appealed to the circuit court which affirmed the decision of the lower court.

From this decision it follows that a patentee who gives an exclusive license to another to manufacture and sell a patented article for the life of the patent, and who at the same time transfers the good-will of the business to the licensee, does not retain any trade-mark rights of which he can avail himself either during the life of the patent or on its expiration. [U. S. Trade-Mark Bulletin, March, 1917.]

* * *

THE MILLER RUBBER CO. v. BEHREND & ROTHSCHILD. A manufacturer of toy balloons, who owned a design patent on a toy balloon made in imitation of a watermelon, has failed in an attempt to restrain a manufacturer from marketing a similar balloon. The court held that the design patent was void, and that no one was entitled to the monopoly of a toy balloon made in imitation of a watermelon. [U. S. Trade-Mark Bulletin, March, 1917.]

A Canadian manufacturer of rubber heels having reduced the terms of discounts, the Toronto Shoe Repairers' Association is asking for a reconsideration and requests 15 per cent discount on all orders of a half gross or more.

THE EHMAN RUBBER CO.

AMONG the progressive rubber manufacturing plants of the middle west is the Ehman Rubber Co., of Twenty-seventh and La Salle Streets, Chicago, Illinois. This company, which is being operated along up-to-date lines, is turning out tires and

PLANT OF THE EHMAN TIRE & RUBBER CO.

mechanical goods of standard quality. The plant, under its present management, has been appreciably extended and plans have already been made for large additions. The new equipment includes up-to-date machinery and devices which contribute so largely to the successful operation of the factory.

A. E. Ehman, president and general manager, has demonstrated by the prompt introduction of available men and methods

EHMAN EXHIBIT AT THE ROTHSCHILD ACCESSORY SHOW.

that he is an efficiency man in the best acceptance of the term.

The Ehman tire, it is claimed, has already achieved an excellent reputation and is being extensively popularized through an aggressive campaign now in operation by its makers.

At the Rothschild Accessory Show held in Chicago, the Ehman exhibit attracted many visitors. The actual operations necessary in the construction of a pneumatic tire were here shown by an experienced demonstrator, who built up a complete tire on the core, ready for vulcanization.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

The Obituary Record.

MANY YEARS IN RECLAIMING BUSINESS.

EDWARD MORTIMER MUNDY, treasurer of the Philadelphia Rubber Works Co., died on March 6 of pneumonia, at the advanced age of 81 years.

Mr. Mundy became associated with the late Colonel Nathaniel Chapman Mitchell, founder of the Philadelphia Rubber Works Co., in 1881, and for 30 years held the office of treasurer of the company.

The following resolution was adopted at the last board meeting of the company:

Resolved: That in the death of our treasurer, Mr. Edward Mortimer Mundy, this company has lost a highly valued and faithful officer of unswerving integrity, whose fine qualities of loyalty and kindness greatly endeared him to all those who had the privilege of being associated with him. The board of directors extend to Mrs. Mundy and to his family the most profound expression of sympathy.

Mr. Mundy was interred at Greenwood Cemetery, Brooklyn, New York. He is survived by his widow and a daughter, Mrs. William G. Davies.

AN EXPERT IN TIRE MANUFACTURE.

James E. Tourtellotte, who died in Philadelphia, Pennsylvania, March 5, was for 21 years connected with the rubber tire business. For 15 years he was superintendent of the Hartford Rubber Works Co., Hartford, Connecticut, and later became general factory manager. At the time of his death he was connected with the Ajax Rubber Co., Inc., at Trenton, New Jersey. He was born at Thompson, Connecticut, September 5, 1857, and was a graduate of the Worcester Polytechnic Institute, Worcester, Massachusetts. A widow and one son survive him.

MANY YEARS WITH ONE COMPANY.

William Volz, assistant secretary of the Eureka Fire Hose Manufacturing Co., New York City, died on April 2, after a brief illness. He entered the employ of the company as office boy 22 years ago, and steadily advanced in usefulness and efficiency, finally reaching the position he held at the time of his death. He is survived by a widow, two children and his mother.

A PIONEER TIRE MAN.

Alexander O. Holroyd, formerly manager of the Prince George Hotel, Daytona, Florida, died in that city the middle of last month. Mr. Holroyd came to this country from England, being identified with the American Dunlop Tire Co. from its beginning, later joining the forces of the Hartford Rubber Works Co., in charge of the automobile tire department, and in 1907 going to Columbus, Ohio, as vice-president of the Midgley Manufacturing Co. In 1909 he left the latter concern to enter the hotel business.

He was a man of pleasing personality and left many friends in the automobile business, and was also popular with tourists wintering in Florida.

FORMERLY A RUBBER SALESMAN.

Elias E. Cox, a veteran of the Civil War, and for more than thirty years identified with the manufacturing rubber industry, died at his home in East Providence, Rhode Island, March 24. He was in his 72nd year and was born at Mount Tabor, Vermont. During the Civil War he served four years in the Seventh Vermont Regiment. He was associated with several rubber concerns in Connecticut and Massachusetts and finally entered the sales department of the National India Rubber Co. at Bristol, about 45 years ago. At the time of the Exposition at Philadel-

phia, in 1876, Mr. Cox was in charge of the National Rubber Co.'s working exhibit. In recent years Mr. Cox had carried on a laundry business in Providence, but his health had been very poor since last September. He leaves a widow, a son and a daughter.

WELL KNOWN IN THE WEST.

Leland E. English, for 16 years special representative of the Voorhees Rubber Manufacturing Co., of Jersey City, New Jersey, died suddenly of apoplexy at Joplin, Missouri, on April 2.

L. E. ENGLISH.

Mr. English was born at Sacramento, California, October 17, 1860. He began his career in the trade with the western branch of the Revere Rubber Co., Chelsea, Massachusetts, first as traveling salesman, and then, successively assistant manager and manager of the Chicago branch establishment of that company. He joined the force of Voorhees Rubber Manufacturing Co. 16 years ago, becoming its special representative in the West. He made his

headquarters in Joplin, Missouri, but he was one of the best-known men in the trade in every city of the West and Middle West. He was a man of striking appearance, had a broad technical knowledge of the trade, was an indomitable worker, and his wonderful capacity of remembering names and faces was combined with a happy faculty of making friends wherever he traveled. He leaves one son, Drummond English, of Chicago, Illinois.

AN OLD AND VALUED EMPLOYEE.

Samuel Gould, for many years in the employ of the American Hard Rubber Co., at its Butler, New Jersey, plant, died at his home in that town recently, aged 63 years.

OZOKERITE IN UTAH.

Ozokerite, which is largely used in insulating compounds and in the manufacture of hard rubber articles, until the present European war, came mainly from Galicia, Austria. Some domestic ozokerite was found in Utah, but not until recently has the American product assumed importance. A deposit in Wasatch County, Utah, which approximates two miles wide and 12 miles long, has been developed within the last year or so. The refining plant at Soldier Summit has a capacity of treating 10 tons of raw material per day, yielding 400 pounds of ozokerite. Changes are contemplated in the process of extraction which it is estimated will enable the plant to handle 1,000 tons of crude material, and proportionately enlarge the output. It is expected that this industry will result in preventing the profitable importation of the Galician product should an attempt be made to do so after the war is over.

RUBBER MANUFACTURING PROCESSES IN SHOW WINDOWS.

MANY enterprising merchandisers have found that the most effective show window advertising has been that which has some "live" element in it, and wax models have given way in many cases to real people, whose actions or labors in the windows have resulted in attracting more closely the attention of the passersby. Rubber manufacturers have not been backward in this respect. Last month in THE INDIA RUBBER WORLD mention was made of the manufacture of rubber footwear in

MAKING FOOTWEAR IN A SHOW WINDOW.

the window of the United States Rubber Co. in its Broadway building in New York City, where two men and two women employees were busily engaged in putting together rubber boots and shoes. There was also shown a machine employed to sub-

CORD-LAYING MACHINES IN A SHOW WINDOW

mit the women's rubbers to heavy atmospheric pressure, thus exploiting the pressure process goods manufactured by that company. On the week of March 19 this company had another exhibit of like character—two young women busily engaged in making bathing caps, while a frame-like orifice at the rear disclosed a third young woman arrayed in bathing cap and costume, whose principal vocation seemed to be to try on one bathing cap after another. Behind her was a back-

ground of a seashore scene. These exhibits were viewed by thousands who stopped for a longer or shorter time in order to see and study the processes, or, perhaps, admire the bather.

Another live exhibit by a rubber company was shown in the Boston, Massachusetts, store of The B. F. Goodrich Co., where two patented cord-laying machines were shown in operation under the supervision of experts sent from the Akron, Ohio, factory. These machines, which seemed almost human in their manipulation in laying the cord for the "Silvertown" tires, created much interest during the entire term of their exhibit and must have been of real practical value in familiarizing automobilists with the construction of these tires. This exhibit is being shown in the various cities where the Goodrich company has large retail stores.

It might be well in this connection to mention the patriotic display shown in the window of the United States Rubber Co.'s store in New York City last month. The window was lined with velvet, and the background was a large United States flag above which were several smaller draped flags interspersed with laurel branches, which were also liberally used as embellishments in other parts of the window. In the center of the window on a marble column was a handsome specimen of the American eagle, mounted on a branch, with wings and beak extended, a fine sample of the taxidermist's art. In front of this was a marble bust of Washington and in the immediate foreground a card

BATHING CAPS IN THE MAKING AND WEARING

reading, "For particulars as to location of army and navy recruiting stations in New York and vicinity please apply in store." At the sides of the window were grouped flags of many friendly nations, among them those of Great Britain, France, Russia, Italy, Belgium, Portugal, Serbia, Roumania, Panama, Cuba and Japan. These flags were grouped around standards which were trimmed with a broad blue ribbon, over which was a narrower white ribbon, thus forming the ribbon trade-mark which has been adopted by the company in its advertising. Not only was the window an artistic and attractive one, but it served its mission by calling attention to the need of recruiting at the time.

THERE IS A PROPOSITION BEFORE THE MILWAUKEE CITY COUNCIL TO pass an ordinance, having for its object the elimination of unnecessary noise. Among the provisions are that no whistles shall be blown to start or end the day's work, or at noon or other time, except fire boats, fire engines or steamboats seeking to pass through a drawbridge. Persons making deliveries of any kind between 11 p. m. and 7 a. m. shall wear rubber heels, and milkmen must pad their trays to eliminate noise.

News of the American Rubber Trade.

BESAW TO BUILD IN ARDMORE, OKLAHOMA.

THE BeSaw Tire & Rubber Co., Hartville, Ohio, is obliged greatly to enlarge its capacity and will shortly build a plant in Ardmore, Oklahoma, this site being selected as offering ample housing for employees, natural resources such as oil and gas fuel, and territory now requiring a large consumption of automobile tires. The new factory will have a capacity of at least 500 tires a day and to finance the project properly the capital stock will be increased from \$220,000 to \$1,000,000. Charles A. BeSaw is president of the company and P. P. Parker, general sales manager.

EXPANSION OF THE FISK RUBBER CO.

This illustration of The Fisk Rubber Co.'s plant at Chicopee Falls, Massachusetts, shows the new mill building which will afford greatly increased tire production, the floor space now devoted to tire manufacture totaling over 29 acres. The new addition is one of the largest single mill buildings in New England, having six floors measuring 600 feet long by 105 feet wide. It is now fully equipped with the most approved machinery, operated by unit electric power plants.

PLANT OF THE FISK RUBBER CO., CHICOPEE FALLS, MASSACHUSETTS.

APSLEY RUBBER CO.

The financial statement of the Apsley Rubber Co., Hudson, Massachusetts, as of January 31, compares with the previous year as follows:

ASSETS:		1917.	1916
Cash, notes and accounts receivable		\$609,927	\$461,560
Inventory		612,061	627,035
Stock investments			57,680
Real estate, machinery, etc.		623,296	580,103
Patent rights and trade-marks		300,000	300,000
Total		\$2,145,284	\$2,026,378
LIABILITIES:			
Common stock		\$500,000	\$500,000
Preferred stock		643,300	615,600
Notes payable		380,000	399,573
Accounts payable		218,608	174,199
Surplus		403,376	337,006
Total		\$2,145,284	\$2,026,378

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on April 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	67½	70
Firestone Tire & Rubber Co., common	129	135
Firestone Tire & Rubber Co., preferred	106½	108
The B. F. Goodrich Co., common	50½	51
The B. F. Goodrich Co., preferred	108½	109
Goodyear Tire & Rubber Co., common	208	213
Goodyear Tire & Rubber Co., preferred	106½	108½
Kelly-Springfield Tire Co., common	51½	52
Kelly-Springfield Tire Co., preferred	85	94
Miller Rubber Co., common	200	210
Miller Rubber Co., preferred	104½	106
Portage Rubber Co.	141	147
Swinehart Tire & Rubber Co.	70	78
United States Rubber Co., common	58½	59
United States Rubber Co., preferred	106¾	107¾

UNITED STATES RUBBER CO. PENSION PLAN.

The United States Rubber Co. has announced a comprehensive pension plan for its employees, whereby every man and woman who has been continuously in the employ of the company for 20 or more years, either with the parent company or any of its subsidiary companies, and has reached a certain age (namely, men 65 and women 60 years), may be retired on a pension, the amount of which will depend upon the wages or salary received and the number of years the employee has served the company. Retirement from service on pension is optional with the employee under certain conditions, and under other conditions lies in the discretion of the Pension Committee. The smallest amount payable will be \$20 per month. Under certain conditions men may be pensioned at the age of 60 and women at 55.

It is expected that the appropriation for the first year will benefit many of the older employees, while the great army of men and women younger in point of service will have the assurance of protection when their efficiency becomes impaired through advanced age. The company will assume such expenditures as may be necessary in

administering the plan and no contributions will be required from any employees.

Employees absent on military service for the country will not have such absence deducted from the computation of their years of service, nor constitute a break in the continuity of employment for purposes of the pension benefits. Service for the country will thus be counted equivalent to service for the company.

RUBBER COMPANY DIVIDENDS.

The American Tire Fabric Co. paid a quarterly dividend of 1¾ per cent on first preferred stock on April 2 to stockholders of record March 20.

The United States Rubber Co. has declared a regular quarterly dividend of 2 per cent on first preferred stock, payable April 30 to stockholders of record April 16.

The Westinghouse Electric & Manufacturing Co. paid a quarterly dividend of 1¾ per cent on preferred stock on April 16. Also, a dividend of ¾ per cent on common stock has been declared, payable April 30 to stockholders of record April 5.

The Kelly-Springfield Tire Co. has declared the regular quarterly dividend of \$1 a share on common stock, payable May 1 to stockholders of record April 16.

The Hood Rubber Co. has declared a quarterly dividend of 1¾ per cent on preferred stock, payable May 1 to stockholders of record April 26.

The Marathon Tire & Rubber Co. has increased its dividend payable May 1 from the rate of 6 to 7 per cent per annum.

At a meeting held on April 25, directors of The B. F. Goodrich Co. declared a regular quarterly dividend of \$1 per share on common stock, payable August 15 to stockholders of record August 3.

TRADE NOTES.

At the annual meeting of The Gutta Percha & Rubber Manufacturing Co., New York City, held on April 4, the old officers were reelected as follows: Henry Spadone, president; Walter W. Spadone, vice-president; Alfred A. Spadone, secretary; George B. Dickerson, treasurer.

The Raw Products Co., New York City, will move on May 1 to 78-80 Wall street, the new quarters comprising a suite of four rooms on the ninth floor.

The general offices of the Republic Rubber Co. of New York, including the mechanical sales department, railroad sales, export sales, and accounting departments, are now located on the fourth floor of the Singer Building, 149 Broadway, New York City, the pneumatic tire sales department and storage rooms remaining at 229 West Fifty-eighth street.

I. J. Cohen & Co., wholesale dealer in rubber, scrap iron and metals, Kansas City, Missouri, has recently moved into a new building at 1,406 West Ninth street.

Work has begun on a new office building for the Republic Rubber Co., Youngstown, Ohio, which will be a duplicate of the present office building, with a connecting link comprising the new entrance, elevator and stairway. The construction will be of reinforced concrete, designed to carry another story when further expansion becomes necessary. It is planned to have this new structure the center unit of a series of three buildings, all to be used for general offices, accounting, etc., including a well-equipped hospital.

The selling corporation, Muller & Phipps (Asia), Limited, whose headquarters are at Englewood, New Jersey, with branch offices in a large number of Asiatic cities, has incorporated its Singapore branch as Muller, Phipps & Sellers, Limited. H. A. Sellers, who was for several years associated with United Engineers, Limited, is managing director.

Byron C. Dowse, former president of the Federal Rubber Manufacturing Co., Milwaukee, and Cudahy, Wisconsin, and formerly one of the chief owners of the G. & J. Tire Co., Indianapolis, Indiana, has formed a new tire manufacturing concern under the name of the Dowse Rubber Co., a certificate of whose incorporation was filed at the office of Secretary of State at Dover, Delaware, with an authorized capital stock of \$2,500,000. The general offices and one factory will be in Chicago, Illinois, with another factory in prospect.

The Eagle-Picher Lead Co. announces the removal of its offices to the Architect's Building, 101 Park avenue, New York City.

The Turner, Vaughn & Taylor Co., Cuyahoga Falls, Ohio, is extending its factory to meet the requirements of a remarkably increased trade in the rubber business, and when the additions to the machine and foundry departments are completed this summer the company will have practically a new foundry, with the floor space about doubled. A new office building is also being erected.

After May 1 the offices of Yglesias & Co., Inc., will be located at 29 Broadway, New York City.

The Red Cross Rubber Co., to be located at Norwalk, Ohio, is the name of a new rubber manufacturing concern which proposes to make rubber novelties. The men interested are Claude Martin and G. M. Switzer, both of Ashland, Ohio.

The Standard Asphalt & Rubber Co., Lawrenceville, Illinois, and the Petroleum Products Co., Independence, Kansas, have recently merged, and the combination will be known as the Sarco Petroleum Products Co. There will be no change in the management or interests identified with the new name.

The Electric Hose & Rubber Co., Wilmington, Delaware, has taken out a \$300,000 blanket policy covering the lives of its several hundred employees.

JOHN W. MAGUIRE.

BRIEF mention was made last month of the appointment of John W. Maguire as general sales manager of tires and mechanical rubber goods of the Brunswick-Balke-Collender Co.,

J. W. MAGUIRE.

of Chicago, Illinois and Muskegon, Michigan. Mr. Maguire is well known in the rubber business, having been associated with it since 1894, when he entered the business as salesman for the Trenton Rubber Co. Six years later he became sales manager for the Lake Shore Rubber Co., Erie, Pennsylvania. In 1906 he associated himself with The Republic Rubber Co., Youngstown, Ohio, as general salesman, and since 1911 has been sales manager of the Chicago branch

establishment of that company, resigning recently to assume his new position.

Mr. Maguire is a "live wire," as is shown in his work for the rehabilitation of the Chicago Automobile Club, of which he was recently elected vice-president. He is also a director in the Chicago Automobile Trade Association, and is president of the Gym Knights, an active organization in the gymnasium life of the Chicago Athletic Association.

It will thus be seen that Mr. Maguire brings to the Brunswick-Balke-Collender Co. not only a ripe experience peculiarly fitting him for his new position, but a wide acquaintance and popularity which must conduce to still greater distribution of the lines for which he assumes the sales management.

PERSONAL MENTION.

Harry E. Dennie, formerly connected with the Salt Lake City branch of the Imperial Belting Co., of Chicago, Illinois, has been appointed Western manager, with headquarters at 525 Market street, San Francisco, California.

Alfred Smith, Manchester, England, dealer in rubber chemicals and compounding ingredients, has opened offices at 98 Maiden Lane, New York City, under the management of E. H. Watson.

Herman Gossen, formerly affiliated with the Bothamley Chemical & Extract Co. and the Casella Color Co., is now associated with J. Early Wood, Inc., New York City, having been appointed manager of the Philadelphia, Pennsylvania, office of that well-known chemical house.

Ralph M. Loewenthal, for the past six years sales manager for The Loewenthal Co., at the Brooklyn, New York, office, has recently resigned. Mr. Loewenthal's future plans are as yet unformed, but he will undoubtedly continue in some branch of the rubber industry. His activities when with The Loewenthal Co. included charge of warehousing operations, facilities, system, and supervision of special gradings, manipulations, etc.

A. F. Peterson has been appointed manager of the San Francisco, California, branch of The Fisk Rubber Co., of Chicopee Falls, Massachusetts, succeeding M. H. Whipple.

PROCEEDINGS OF THE RUBBER ASSOCIATION.

THE following cable correspondence between British rubber associations and The Rubber Association of America, Inc., will be read with interest:

London, April 17, 1917.
President Firestone, Rubber Association of America, New York City:
The committee of the Rubber Trade Association of London, on behalf of all members, extend to you, your executive and members, cordial and sincere greetings on the active participation of the United States in the defense of the free peoples.
WILLIAM HENDREY, Chairman.

New York, April 23, 1917.
William Hendrey, Chairman, Rubber Trade Association of London, London, England.:
Officers, directors and members of Rubber Association of America unite in reciprocating your greetings. The United States stands ready to make every sacrifice, and we welcome and are proud of the opportunity to fight for our common ideals of humanity and civilization.
FIRESTONE, President, Rubber Association of America.

London, April 20, 1917.
Firestone, President, Rubber Association America, New York City:
Council of Rubber Growers' Association tenders, on America Day, fraternal greetings Rubber Association of America on entry of United States into struggle for preservation of civilization.
ROSING, Chairman.

New York, April 23, 1917.
Rosling, Chairman, Rubber Growers' Association, London, England:
Officers, directors and members of Rubber Association of America united in reciprocating your fraternal greetings. England and America have common ideals, and the United States stands ready to make every sacrifice for the preservation of our civilization.
FIRESTONE, President, Rubber Association of America.

NEW MEMBERS.—At the Executive Committee meeting held April 5, one associate and eight firm members were elected.

FIRM MEMBERS.

Corona Rubber Reclaiming Co., Germantown, Pennsylvania. Representative, R. B. Caverly.
Stockton Rubber Co., Stockton, New Jersey. Representative, D. G. Price or E. K. Price.
Gillette Safety Tire Co., Eau Claire, Wisconsin, Representative, S. P. Woodard.
The Barrett Co., New York City. Representative, F. J. Barber.
Industrial Chemical Co., New York City. Representative, J. Wrench.
Gaston, Williams & Wigmore, New York City. Representative, D. Gonzales.
Hawkeye Tire & Rubber Co., Des Moines, Iowa. Representative, John T. Christie.
Alexander & Baldwin, Inc., New York City. Representative, C. A. Dann.

ASSOCIATE MEMBER.

Kelly-Springfield Tire Co., New York City. Representative Frederick A. Seaman or Otis R. Cook.

LEGISLATIVE COMMITTEE.—George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York, volunteered to act as the third member of the Legislative Committee. This committee, the other members of which are Frederic C. Hood, chairman, and H. Stuart Hotchkiss, is actively opposing the proposed tax on crude rubber. As a result of its efforts there is every reason to believe that the war revenue bill will not include crude rubber in the list of materials proposed for taxation.

RUBBER RECLAIMERS DIVISION.—At the meeting held April 11, the circular, "Standards of Scrap Rubber Specifications and Packing" was approved and will be presented for adoption at a conference of the Classification and Conference Committee of the Scrap Rubber Division of the National Association of Waste Material Dealers, and the Reclaimers' Division of the Rubber Association, to be held on May 2.

RUBBER SUNDRIES DIVISION.—The Rubber Sundries Manufacturers' Division met March 30 and voted to establish an "Open Price Exchange Bureau" for the purpose of distributing price information to the members. It is reported that the Bureau will be in operation May 1. A meeting will be held May 4, and in the future such meetings will be held on the first Friday of each month.

EXPORTERS DIVISION.—This division will meet May 4, when the Committee on By-Laws and the Committee on Nominations will present their respective reports.

PROPOSED PROOFERS DIVISION.—A meeting was held on March 26 and preliminary action taken to effect a permanent organization at the meeting held on April 25.

SPECIAL MEETING.—A special meeting of the firm members was held April 26 and changes in the certain amendments to the constitution and by-laws were made to facilitate the work of the Committee on Arbitration.

NATIONAL DEFENSE.—At a joint meeting of the Executive Committee and Rubber Advisory Committee, April 5, a committee consisting of H. Stuart Hotchkiss, Arthur H. Marks and Frederic C. Hood was appointed to represent The Rubber Association of America, Inc., and to offer to the United States Government, through the Advisory Commission of the Council of National Defense, the services of The Rubber Association of America, Inc.

TRADE NOTES.

The Towar Cotton Mills, Inc., Niles, Michigan, is contemplating the enlargement of its mill for the purpose of manufacturing tire fabrics. The mill is now running to capacity on heavy duck, and the company is considering the installation of 40 automatic wide looms, designed especially for weaving tire duck. Scott Towar, of Chicago, Illinois, is president.

The Ellert Rubber Co., F. I. Ellert proprietor and manager, is now located at 1307 Sutter street, San Francisco, California, where a complete stock of automobile tires, tubes and accessories is carried.

The Saginaw Tire Co., Saginaw, Michigan, is equipped for retreading old tires and also carries new tires and tubes. F. C. Loudon is general manager.

The Para Auto Tire Co., Chicago, Illinois, distributor for the Vacuum Cup automobile tires of the Pennsylvania Rubber Co., has been awarded a contract by the City of Chicago, Department of Police, for their entire requirements in pneumatic tires for the year 1917; also for the Frank Parmelee Co., and, in addition, the Para company is furnishing these tires as regular equipment to the Marshall Field Co., Mandel Brothers, and other large corporations and commercial houses in that city.

The capital stock of the Dunlop Tire Sales Co., Inc., New York City, has been increased to \$250,000.

The C. A. Shaler Co., Waupun, Wisconsin, maker of vulcanizing apparatus, tire tools and accessories, will add two stories, 50 by 50 feet, to its present one-story nickel-plating shop.

The Turner Tire Co., St. Louis, Missouri, incorporated with a capital stock of \$13,000 by F. E. Turner, Muskogee, Oklahoma; Charles Neimeyer, Little Rock, Arkansas, and N. W. McLeod, H. V. Stevens and S. T. G. Smith, to manufacture vehicle tires, has been dissolved.

The property of the Alliance Rubber Co., Alliance, Ohio, was sold at public auction by H. C. Koehler, receiver, on April 14. The purchaser was the Sioux City Tire & Rubber Co., and the price paid was \$45,000, a figure in excess of the appraised value. The Sioux City company expects to remove the machinery and equipment to its new plant in Sioux City, Missouri. The real estate will be sold.

Fire recently damaged the plant and stock of the McFall Rubber Co., Kansas City, Missouri, to the extent of \$40,000, about \$35,000 worth of tires and accessories being consumed.

The Colorado Tire & Leather Co., Denver, Colorado, is completing two additional units to its plant, with complete calender, mill and tire equipment. This company is now manufacturing a full line of tires and various rubber accessories for the automobile trade, including fan belts, emergency boots, cement, repair materials, etc., and the new units will enlarge the capacity of the plant approximately 50 per cent.

The Sterns Tire & Tube Co., St. Louis, Missouri, has taken over the \$1,000,000 company of the Efficiency Oil Corp., the name of the latter concern being changed to Sterns Tire & Tube Co. on December 6, 1916.

A. D. Phillips, formerly general eastern agent of the Western Maryland Railway, is now traffic manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, with entire charge of the company's shipping and rating.

E. C. Merkel, formerly branch manager for the Knight Tire & Rubber Co., in Chicago, Illinois, recently resigned to take charge of sales for the Chicago branch of the Federal Rubber Co.

TALMON HENRY RIEDER.

TALMON HENRY RIEDER, who was recently elected president of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, has had a somewhat phenomenal career. Com-

T. H. RIEDER.

paratively few men less than 40 years of age have risen to such high and important position, and fewer still can point to a more steady and rapid advancement, once their proper vocation is found. Born in the little town of New Hamburg, Ontario, Canada, after graduation from the high school at Berlin (now Kitchener), Ontario, he entered the general store of his father at the age of 14 as clerk. Five or six years afterward he became stenogra-

pher and also meter reader for the Berlin Gas Company.

In 1900 he entered the rubber business as bookkeeper and director of the Berlin Rubber Manufacturing Co., Limited. Three years later he organized the Merchants Rubber Co., Limited, built the plant at Berlin and became managing director. Ten years ago the Berlin and the Merchants companies were absorbed by the Canadian Consolidated Rubber Co., Limited, at which time he was made vice-president and manager of the two companies at Berlin. In 1908 he was elected vice-president of the Canadian Consolidated Rubber Co., Limited, and in 1915 was made general manager, still retaining the vice-presidency. Last month he was elected president.

From a minor position in a small rubber company, to the head of one of the six greatest industries in Canada in the short space of 17 years is an achievement of which he may well be proud. To have done this is an earnest proof of his indomitable energy, his untiring zeal and his executive ability.

W. D. ALLEN MANUFACTURING CO. MOVES.

The new building into which the W. D. Allen Manufacturing Co., Chicago, Illinois, will move about May 1 is shown herewith.

W. D. ALLEN MANUFACTURING Co.'s
NEW BUILDING.

located at Lake and Jefferson streets and has seven stories and basement, with a 61-foot frontage.

The business of this concern in mechanical rubber and brass goods has for some time been beyond the capacity of its former quarters at 133-135 West Lake street, necessitating the rental of warehouse space in three different locations. The new plant is

CANADIAN CONSOLIDATED ANNUAL REPORT.

The Canadian Consolidated Rubber Co., Limited, of Montreal, Canada, according to its annual report for the calendar year 1916, did the largest volume of business in its history. The condensed statement of the Consolidated and constituent companies gives the following figures:

ASSETS.	
Property and plants.....	\$6,256,951.87
Inventories, manufactured goods and materials.....	\$5,372,588.25
Cash	89,043.19
Accounts and bills receivable.....	2,319,130.43
Investments, including good will.....	4,511,094.79
Miscellaneous	447,097.71
	<u>12,738,954.37</u>
LIABILITIES.	
Preferred capital stock.....	\$3,000,000.00
Common capital stock.....	2,805,500.00
	<u>\$5,805,500.00</u>
6 per cent bonds due October 1, 1946.....	2,596,500.00
5 per cent debentures due December 1, 1918.....	2,500,000.00
Bills payable	2,771,244.73
Accounts payable and sundry accruals.....	1,168,536.57
Reserve for bad debts, depreciation, etc.....	846,224.89
Surplus	3,307,900.05
	<u>\$18,995,906.24</u>
INCOME.	
Net sales, footwear, tires, mechanical and miscellaneous.....	\$12,094,695.51
Cost of goods sold, selling and general expenses, taxes, interest on borrowed money, repairs, depreciations, provisions for bad debts and tire replacements net.....	<u>11,189,490.42</u>
Net profit from operations.....	905,205.09
War tax on profits.....	<u>77,624.80</u>
Net profits remaining with company.....	827,580.29
Dividends paid on preferred stock.....	<u>209,979.00</u>
Net addition to surplus.....	617,601.29
Surplus January 1.....	<u>2,690,298.76</u>
	<u>\$3,307,900.05</u>

All the factories were operated at near full capacity as available and suitable help would allow. Some minor extensions were made at several factories, and there is ample factory capacity for a further increased business, provided a sufficient number of workers can be obtained. Factories have been kept in thorough repair and up-to-date in all respects.

W. G. RYCKMAN INCORPORATES.

The business of W. G. Ryckman, the well-known crude rubber broker, 77 Broad street, New York City, will be conducted hereafter under the name of W. G. Ryckman, Inc. Mr. Ryckman is president, and C. B. Kaufmann, who has been associated with the business for a number of years, is secretary and treasurer of the newly formed corporation. There will be no change in the manner in which the business will be operated, the concern continuing to act as broker, as well as representative in the New York market of various foreign shippers at primary points.

HOOD RUBBER CO. EXTENSION.

The new tire plant of the Hood Rubber Co., East Watertown, will be one of the most thoroughly modern, and fully equipped factories in the country for the manufacture of tires. It is expected to be ready for operation some time this year. As soon as it is equipped and manned, the present output of tires will be trebled. The footwear department is running to full capacity. The line of rubber-soled canvas shoes is so attractive and popular that this branch of the business will be steadily employed well into the summer, while the rubber boot and shoe departments have orders on hand sufficient to keep them going to full capacity through the entire year.

Goodyear Cotton Mills, Inc., paid a regular quarterly dividend of $\frac{1}{4}$ per cent on preferred stock on April 2 to stockholders of record of that date.

The name of the Rubber & Celluloid Harness Trimming Co. of Newark, New Jersey, has been changed to the Rubber & Celluloid Products Co., as per certificate filed with the Secretary of the State of New Jersey.

NEW INCORPORATIONS.

Acme Tire & Supply Co., The, March 3 (Ohio), \$50,000. H. J. Alperin (president and general manager), Cleveland, Ohio; Morris Levine (secretary and treasurer), Pittsburgh, Pennsylvania. Principal office at 2009 Euclid avenue, Cleveland, Ohio, with branches in Detroit and Kansas City. To establish a chain of stores and garages and expand on a jobbing basis.

Ardmore-Akron Tire & Rubber Co., The, February 17 (Oklahoma), \$1,000,000. John C. Harmony and Charles A. BeSaw—both of Canton, Ohio; Elmer S. Wood, Ft. Smith, Arkansas. Location of plant, Ardmore, Oklahoma. Oklahoma City office is 112 Herskowitz Building, Oklahoma City. To manufacture rubber tires and other rubber products.

Atlas Auto Accessories, Inc., March 31 (New York), \$50,000. F. X. Carmody, 1114 Ocean avenue, Brooklyn, New York; G. A. McLaughlin, 61 Broadway, and J. T. Condon, 174 West Ninety-seventh street—both in New York City.

Bare Wire Co., Inc., The, April 11 (New York), \$500,000. Edwin W. Moore and G. F. Waterbury—both of 10 East Forty-third street; John S. Keith, 40 Wall street—all in New York City. Principal office, New York City. To manufacture water-proof and insulated wire.

Burdick Tire & Rubber Co., March 22 (Delaware), \$1,000,000. Herbert E. Latter; Norman P. Coffin—both of Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. Principal office with the Corporation Trust Co., Dupont Building, Wilmington, Delaware. To manufacture and deal in rubber and gutta percha and all goods of which rubber and gutta percha are component parts.

Commercial Tire & Rubber Co., Inc., March 26 (New York), \$1,000. Sydney Bernheim, 35 Nassau street, New York City, and C. A. Weldon, 591 Seventh street; H. H. Jacobson, 555 Grand street—both in Brooklyn, New York. To manufacture automobile tires, etc.

Cossey Tire & Supply Co., February 20, (Oklahoma), \$5,000. Wallace Cossey, Cora B. Cossey and J. Frank Davis—all of Muskogee, Oklahoma. Principal office, Muskogee, Oklahoma.

Couchois Tire Corp., April 17 (New York), \$50,000. Garrett J. Couchois, Rutherford, New Jersey; Rudolph Tiktin, and Joseph Klingenstein—both of 5 Nassau street, New York City.

Defender Tire & Rubber Co., March 22 (Delaware), \$2,000,000. F. R. Hansell, Geo. H. B. Martin—both of Philadelphia, Pennsylvania, and S. C. Seymour, Camden, New Jersey. Principal office with the Corporation Guarantee & Trust Co., Ford Building, Wilmington, Delaware. To manufacture and generally deal in solid and inflated tires and tubes.

Delta Auto Supply Co., Inc., April 4 (New York), \$10,000. Alfred V. Hines and Walter E. Ufer—both of 1074 Lexington avenue, and Bailey C. Elliott, 1400 Broadway—all in New York City. To deal in tires and auto supplies.

Dowse Rubber Co., March 14 (Delaware), \$2,500,000. John H. Redmond, 10 East Forty-third street; Walter S. Logan, 1142 Madison avenue, and Arthur Nikoloric, 55 Liberty street—all in New York City. To buy, sell, exchange and deal in any and all kinds of property, and to conduct a general trading, manufacturing, mercantile or mechanical business.

Erickson Tire Corp., April 6 (Delaware), \$300,000. Wm. Howard Hoople, 277 Brooklyn avenue; Walter Anderson, 1450 New York avenue, and Geo. M. Brooks, 109 West Forty-fifth street—all in Brooklyn, New York. Office with the United States Corporation Co., Dover, Delaware. To buy, sell, manufacture and deal in automobile tires, wheels, and accessories.

Exhausted Heated Vulcanizer Co., March 10 (Delaware), \$50,000. John Niason, Chas. W. Griffith and Ed. T. McGowan—all of Altoona, Pennsylvania. Principal office with the Capital Trust Co., Dover, Delaware. To manufacture and retail exhaust heated vulcanizers, automobile accessories and novelties.

Federal Vulcanizing Works, March 2, (Illinois), \$2,500. Henry B. Stulik, Otto Horacek, and J. M. Laventhal, 1103 Harris Trust

Building, Chicago, Illinois.

Flexible Armored Hose Corporation, April 16 (New York), \$50,000. Lester F. Gilbert, 724 Lafayette avenue; Edw. G. Kinkel, 117 Russell avenue, and C. Arthur Dutcher, 257 Elmwood avenue—all in Buffalo, New York.

Forbes Auto Supply Co., Inc., March 15 (New York), \$10,000. W. J. Brannen, F. E. Dunbar and R. N. Forbes—all of Olean, New York. To deal in auto supplies, tires, etc.

Frontier Auto Supply Co., Inc., March 12 (New York), \$1,000. Samuel W. Caplen, Harold Greenstein and Gerald Landau—all of Buffalo, New York. To deal in tires and other auto supplies.

Giant Tire & Sales Co., Inc., April 12 (New York), \$10,000. Jos. M. Johnson, Lenora Z. Johnson, and Arthur L. Dunton—all of Rochester, New York.

Indian Tire Sales Co., Inc., March 31 (New York), \$10,000. David B. Parker (president), 2657 Bainbridge avenue; Joseph M. Hetzer (vice-president and general manager), 152 West Sixty-fourth street—both in New York City, and John Barnett (secretary and treasurer), 1559 East Twelfth street, Brooklyn, New York. Factory at New Brunswick, New Jersey, and New York branch and service station, 246 West Sixty-fifth street, New York City. Distributer for the Indian Tire & Rubber Co., New Brunswick, New Jersey, manufacturer of solid rubber tires.

India Rubber Co., The, December 1, 1916 (Ohio), \$250,000. J. M. Alderfer (president); J. K. Williams (vice-president)—both of Akron; D. A. Grubb (secretary), Cleveland, and Paul C. Searles (treasurer), East Cleveland—all in Ohio. To manufacture automobile tires and inner tubes.

Illinois Tire & Supply House, February 26 (Illinois), \$5,000. James W. Bell, Paul E. Sheehan and Willis Melville. Principal office, Hilgrove and Fifth avenue, La Grange, Illinois.

Manufacturers' Tire & Rubber Co., Inc., The, January 9 (New Jersey), \$100,000. Eric Windmiller, 43 High street, Passaic; Herman Feder, 335 Belmont avenue, Newark—both in New Jersey, and Justin S. Galland, 25 Broad street, New York City. Principal office, 218 Halsey street, Newark, New Jersey. To manufacture and deal in automobile tires and tubes, etc.

Meyer Rubber Co., The, October 18, 1916 (Ohio), \$100,000. A. W. Ellenberger, C. A. Walter, Fred W. Hachel, O. M. Roderick, and E. L. Mallory. Principal office, Massillon, Ohio.

National Rubber Co. of New York, March 22 (Delaware), \$5,000,000. F. R. Hansell, Geo. H. B. Martin—both of Philadelphia, Pennsylvania, and S. C. Seymour, Camden, New Jersey. To buy, sell and deal in crude, refined and manufactured rubber.

The New Idea Double Tire Co., Inc., March 30 (New York), \$2,500. Ella A. Rosenbloom and Samuel Rosenbloom—both of 10 Suter Terrace, and Henry Johnson, 801 Dewey avenue—all in Rochester, New York.

Nesbit Sales Corporation, F. T., March 15, (New York), \$10,000. Frank T. Nesbit and Thorpe D. Nesbit, 468 Riverside Drive, and William N. C. March, 42 Broadway—both in New York City. To manufacture motors, engines, supplies, etc.

Niagara Vulcanizing Works, Inc., April 17 (New York), \$2,000. John Dietz, 357 Fifth street, Glenn A. Stockwell, 463 Eighth street—both of Niagara Falls, and Enoch Layer, 277 Prospect street, Lockport—all in New York. To repair tires, etc.

North Star Rubber Co., October 20, 1916 (Minnesota), \$250,000. J. C. Spillane, S. H. Greeley, and J. W. Laramy—all of St. Paul, Minnesota. Principal office, St. Paul, Minnesota. To manufacture all kinds of merchandise of rubber and gutta percha.

Pacific Tire & Rubber Co., March 16 (Washington), \$10,000. Ardo M. Peterson, Roy Peterson, and Leon E. Peterson—all of Seattle, Washington. To deal in automobile tires and accessories.

Pacific Tire & Rubber Co., Inc., April 3 (New York), \$2,000. Sydney Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 Seventh street, and H. H. Jacobson, 555 Grand street—both in Brooklyn, New York.

Pacific Tire & Rubber Co., January 11 (California), \$500,000. H. C. Wharfield, Otto Hasencamp, E. C. McDowell, Hugh K.

Walker, Jr., and H. C. Natter—all of Los Angeles, California. Principal office, Los Angeles, California.

Phoenix Rubber Co., The, March 19 (Ohio), \$125,000. Theodore Krumeich (president), F. R. Ormsby (vice-president), C. C. West (treasurer), and S. G. Ridgon (secretary and general manager). To reclaim rubber.

Plastic Inlay Rubber Co., March 26 (Delaware), \$500,000. F. D. Buck, Geo. W. Dillman and M. L. Horty—all of Wilmington, Delaware. To manufacture and sell automobile tires and tire tubes and rubber goods of all kinds.

Plexas Tire & Rubber Co., February 13 (Pennsylvania), \$50,000. William W. Moore (treasurer), 1338 Sixty-fifth avenue; Frederick Doriety, 4718 N. Twelfth street, and Walter Hess, 4914 Cedar avenue—all in Philadelphia, Pennsylvania. Principal office, Philadelphia, Pennsylvania. To manufacture, buy and sell rubber goods, automobile tires, tubes, accessories and any other articles of similar character.

Pneumatic Wheel Co., March 9 (South Dakota), \$2,000,000. Kay Todd, Walter Fosness, Arthur E. Nelson, and A. M. Joyce—all of St. Paul, Minnesota. Principal office, 510-512 Endicott Building, St. Paul, Minnesota. To manufacture the J. A. Borland wheel with solid rubber tire invented by Mr. Borland.

Porter Tire Sales Co., Inc., March 28 (New York), \$500. Daniel B. Nally, 125 Wall avenue, Mt. Vernon, New York. Thos. F. MacMahon and Bailey C. Elliott—both of 1400 Broadway, New York City.

Quality Tire Co., Inc., April 17 (New York), \$1,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, New York.

Resilient Fibre Co., March 5 (Delaware), \$500,000. Geo. B. McLeod, Lumberton, North Carolina; Edwin D. Chadwick, W. E. Brockman, J. L. Alverson, J. P. Price, and W. F. Eller—all of Washington, D. C. Principal office with the Corporation Co., of Delaware, 901 Market street, Wilmington, Delaware. To manufacture and sell a certain resilient fibre made of cotton or other material.

Republic Rubber Sales Co., February 21 (Ohio), \$10,000. John T. Harrington, Union C. Deford, Fred J. Hein, Clyde W. Osborn and J. W. Blackburn. Principal office will be located at Youngstown, Ohio. This company is formed to handle the sales of The Republic Rubber Co., of Youngstown, Ohio.

Saniton Specialty Co., Inc., April 7 (New York), \$5,000. Herman Stang, 1051 Boston Road, Joseph I. Wiesner, 706 East Sixth street—both in New York City, and Nicholas Lawner, 1626 Forty-fifth street, Brooklyn, New York.

Smoth Rubber Sheeting Co., Inc., March 28 (New York), \$5,000. Louis B. Silver, 864 Fox street; Louis Rosenbloom, 937 East 172d street, and John J. Hanley, 65 Fourth avenue, all in New York City.

Stylux Manufacturing Co., Inc., March 29 (New York), \$10,000. E. A. Falk, 150 East Sixty-first street; Harry E. Herman, 170 Broadway—both in New York City, and Jeanette A. Bravy, 254a Saratoga avenue, Brooklyn, New York. To manufacture rubber, cement, paints, etc.

United Vulcanizing Co., Inc., April 10 (New York), \$500. Anthony Fenninger, 565 Amsterdam avenue; Hermann Wurm, 246 West 106th street, and Jos. A. Fenninger, 1328 Edwards avenue—all in New York City. Tire repairing, etc.

Valley Tire Co., March 13 (Tennessee), \$5,000. Albert Wooldridge, Latham Wooldridge, O. N. Wilkins, R. F. Katz, and E. G. Riddick. Principal office, Nashville, Tennessee, to buy and sell autos, tires, etc.

Western Tire Brokerage Co., March 23 (Missouri), \$4,000. John C. Shaffner, Mabel L. Bartling, and Josephine C. Turner—all of St. Louis, Missouri. Principal office, St. Louis, Missouri.

THOMAS L. ROBINSON.

ALTHOUGH perhaps having a wider experience in financial and legal circles than in rubber manufacture, the subject of this sketch occupies the important position of president of

the Republic Rubber Co., Youngstown, Ohio, and during the seven or eight years that he has been connected with it, the company has shown steady and material progress.

Thomas L. Robinson was born in Ravenna, Ohio, June 28, 1880. His father was a prominent jurist. Among his ancestors he can count those who were officers or soldiers in the three principal American wars, the Revolution, the War of 1812, and the Civil War.

THOMAS L. ROBINSON.

After completing his education at Western Reserve Academy and the University of Michigan, Mr. Robinson entered the practice of law at Youngstown, Ohio. In 1907-8 he organized the Wick Brothers Trust Co. and became its president. This was later consolidated with the Dollar Savings & Trust Co., of which he was made vice-president. He became a director of the Republic Rubber Co. in 1910, and the next year was elected its president, an office he has held ever since.

Mr. Robinson is a public-spirited man, prominently connected with other institutions in Youngstown. He is a director in the First National Bank, the Realty Trust Co., the Union Safe Deposit Co., and is interested in other local institutions. He is a member of the Youngstown Club, the Youngstown Country Club, Poland Country Club, Zeta Psi, Phi Delta Phi and Phi Beta Kappa fraternities, Military Order of Loyal Legion, Sons of American Revolution, Ohio Society of New York, the Bankers' Club of New York, and The Rubber Association of America, Inc.

COTTON FABRIC TRADE NOTES

THE Bibb Manufacturing Co., Columbus, Reynolds and Macon, Georgia, has just completed a mill at Porterdale, Georgia, with 20,000 spindles and 100 looms for manufacturing cotton duck.

* * *

O. A. Barnard announces that he has severed his connection with the firm of J. H. Lane & Co., New York City.

* * *

The Cannon Manufacturing Co., Concord, North Carolina, is enlarging its plant to add to its product the manufacture of tire fabrics, which, like the present output, will be sold through Cannon Mills, New York and Philadelphia.

* * *

Clarence F. Holmes, formerly secretary of R. J. Caldwell Co., Inc., New York City, is now associated with the Butterick Publishing Co., New York City.

THE DECLINE OF RUBBER IN PHOTOGRAPHY.

JUST as the march of progress is ever creating new uses for india rubber, so it occasionally eliminates a few of the earlier applications, for the history of scientific development is also a record of the survival of the fittest. However well rubber, or any other substance, may perform the function required of it, a new process or substitute device may at any time revolutionize the art to which that substance had been applied and so relegate it to the limbo of the past. In photography, for instance, the applications of rubber are gradually but surely diminishing in number. While in a sense regrettable, this side of the rubber industry in any field presents beneficial lessons deserving more than passing thought, and it is in this spirit that the following instances are cited.

Only two or three years ago most cameras had a rubber bulb and tube to operate the shutter. This equipment had to be replaced frequently and for the most part has now been replaced by the antinous or flexible cable release which conveys no vibration to the camera yet will last as long as the camera itself. While hard rubber still supplies the leaves and iris diaphragm of many shutters and lenses, as many more now on the market and made of very thin sheet steel are giving satisfaction and have the advantage that they never crack where pivoted. Hard rubber plate-holder slides have for the most part given way to leatherboard and other specially prepared cardboards of smooth, hard surface. These are cheaper and do not become electrified by friction in handling nor attract dust to the plate like hard rubber. Developing trays and tanks of hard rubber are still stocked by most photo-supply dealers, but seem to render no better service than the cheaper receptacles of glass, fiber, agate and artificial stoneware.

India rubber cloth, by which is meant cotton fabric coated on both sides with a thin film of rubber, still has its photographic uses, although not to the former extent. India rubber focusing-cloths are opaque, as such cloths should be, and are of additional value in protecting the camera during bad weather. Cut pieces of rubber fabric or sheet rubber have long been employed in the printing-frame, back of platinum paper, as a protection from dampness. Once finished, however, a platinum print is a thing of rare beauty and as near absolute permanence as anything known to photography, but the scarcity and high cost of platinum have restricted the use of this medium, and like all sun-printing papers it is gradually giving way to the more easily worked gaslight papers.

Another printing accessory now rarely seen is the squeegee-pad for glazing prints to a high gloss surface. It consists of a sheet of celluloid placed between two covers of india rubber cloth, the wet prints being applied face down to both sides of the celluloid, the rubber covers brought over them and a roller squeegee being applied over the fabric to bring print and celluloid into close contact for drying. Photographers gradually came to the conclusion, however, that the rubber sheeting was superfluous, and that the ferrotype tin of today lasts longer, gives a better gloss and is less likely to stick to the print. And here again low first cost also became a contributing influence.

In photographic processes rubber is holding its own better than in apparatus and accessories, although the amount consumed in the former is inconsiderable. It found favor for a time as a mountant of glazed and dry prints without cockling, a solution being prepared with carbon disulphide and 5 per cent absolute alcohol. It was discovered, however, that the rubber perishes in time and leaves the mount.

Pure washed and masticated, unvulcanized rubber was formerly employed as an edging for wet-plates to prevent the collodion coating from leaving the glass, but the faster gelatine dry-plate has superseded its predecessor for all work except photo-engraving, and is making inroads upon that field as well.

In the collotype process of ink printing from a specially prepared photographic glass positive, india rubber solution is used for attaching to the negative the tinfoil used for masking, but the collotype process has fallen into disfavor to a considerable extent, with the development of half-tone, photogravure and other etching methods.

In photo-engraving, a solution of india rubber in benzol of 2 per cent strength is used for stripping wet collodion films. The collodion negative is flowed with the rubber solution, and when this is dry it is again flowed with stripping-collodion. The rubber solution prevents the solvents of the stripping-collodion reaching the original collodion film, and at the same time increases the flexibility and toughness of the film.

India rubber solution continues to be used in aerograph or air-brush retouching because it possesses a distinct advantage over other stopping-out mediums applied to shield certain portions of the print on which the aerograph spray is not wanted. Whereas most other mediums require the application of a solvent for their removal after the spraying has been completed, the rubber film peels off easily upon rubbing with the finger-tip and carries with it any spray that may have spread beyond the desired boundaries.

Thus the instances cited make it plain, were this necessary, that no primary use of rubber will persist unless rubber in its particular application has important, desirable qualities and distinct advantages peculiar to itself; also that as an accessory its continuance is dependent upon the fate of the device or process in connection with which it is employed. It cannot long compete with substitutes of lower cost which answer the purpose equally well. The big rubber markets will ever be associated with those articles greatly in demand which cannot be manufactured of any other substance.

DAYTON RUBBER MANUFACTURING CO. BUILDS MODEL PLANT.

Building operations have begun on the new plant of The Dayton Rubber Manufacturing Co., Dayton, Ohio. The site comprises 21½ acres of ground, with a frontage on the Pennsylvania Railroad of about 1,500 feet, affording ideal shipping facilities. The main building will be about 500 feet in length and 150 feet in width, part of which will be one story 20 feet high and part three stories, and is so planned that plenty of light will be provided in all parts of the plant, which will be constructed of structural steel, concrete and brick.

The second story will be used for offices and the third story will be arranged for a large hall for the employes and their friends. The ground not occupied by buildings will be set aside for a ball field, tennis courts, etc., for the benefit of employes. The power plant will occupy a separate building, 70 by 90 feet, and the boilers will all be equipped with stokers to eliminate smoke.

The Dayton company manufactures both airless and pneumatic tires, and the new plant will have a capacity of 1,000 tires per day, nearly 1,000 men being employed. John A. MacMillan is president and general manager.

DU PONT COMPANY ACQUIRES HARRISON BROTHERS PROPERTY.

Through the purchase of Harrison Brothers & Co., Inc., Philadelphia, Pennsylvania, by E. I. du Pont de Nemours & Co., Wilmington, Delaware, two of the oldest manufacturing concerns in this country have united, the Harrison business dating from 1793 and that of the du Pont from 1802. The new corporation conducting the business of Harrison Brothers in chemicals and pigments will be known as Harrison, Inc., but the organization remains practically the same.

The Mantua Chemical Co., Camden and Paulsboro, New Jersey, a part of Harrison Brothers, is also included in the transfer to the du Pont company, the business being continued under the name, Mantua Chemical Co.

LEE RUBBER AND TIRE CORPORATION REPORT.

In presenting the first annual report of the Lee Rubber & Tire Corp., Conshohocken, Pennsylvania, A. A. Garthwaite, president, stated that the discontinuance of dividends at the January meeting was due to the high cost of materials and additions to the plant and equipment, which will result in benefit to the stockholders.

The treasurer's report follows:

CONSOLIDATED BALANCE SHEET.

December 31, 1916.

ASSETS.

Cash	\$258,560.45

HORACE C. COLEMAN, Treasurer.

The recently elected officers and directors of this company are as follows: John J. Watson, Jr., president; A. A. Garthwaite, vice-president and treasurer; D. W. Pinney, assistant treasurer and assistant secretary; Henry Hopkins, Jr., secretary. Directors: John J. Watson, Jr., J. W. Prentiss, G. M. P. Murphy, Stephen B. Fleming, Samuel H. Miller, all of New York City; Jos. Wayne, Jr., Philadelphia, Pennsylvania; J. W. Johnson, New Brunswick, New Jersey; Horace C. Coleman, Norristown, Pennsylvania; A. A. Garthwaite, Conshohocken, Pennsylvania.

PROGRESS OF CROWN TIRE & RUBBER CO.

The Crown Tire & Rubber Co., now located in temporary quarters in Ralston, Nebraska, a manufacturing suburb of Omaha, expects to occupy its new plant by July 1. The new building will be 130 by 60 feet, three stories high, with a separate boiler house about 30 feet square. This will afford a daily capacity of 500 automobile tires and tubes, and the company will also manufacture motor cycle tires, tire accessories, and, eventually, mechanical rubber goods. H. A. Reichenbach is president and general manager, and E. A. Miller, formerly of Akron, Ohio, superintendent.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

A VALUABLE contribution to the industrial progress is embodied in the recent establishment by several Akron rubber factories of 30 scholarships in the engineering college of the Municipal University of Akron. The candidates will be chosen from high school graduates and the scholarships will cover all tuition, incidental and laboratory fees. The course will be on a cooperative basis, including alternate two-week periods in factory and college, thus bringing the student into practical relation with the various problems in every department of the industrial organization. Each student will receive from the company employing him, \$37.50 for each two-week period of work, and at the end of the four-year course will have the opportunity of a permanent position in the organization in which he has been trained.

* * *

The proposed trebling of capacity in the plant of the Mason Tire & Rubber Co., at Kent, to 1,500 tires per day necessitates additional working capital and an increase from \$1,000,000 to \$3,000,000 was ratified at the stockholders' meeting on the fifth

MASON TIRE & RUBBER CO. PLANT WITH PROPOSED ENLARGEMENT.

of last month. The company started manufacturing tires in October, 1916, and its growth has been remarkably rapid. Over 200 distributors and dealers in the United States now handle Mason tires and tubes, and three direct factory branches are maintained in New York City, Cleveland, Ohio, and Kansas City, Missouri. A large warehouse is now under construction at the home plant, a modern office building will be erected this summer, and the main plant extensions will begin in the early fall. The architects' drawing of the completed factory is shown in the accompanying illustration.

* * *

The B. F. Goodrich Rubber Co. has recently been organized as the selling organization of The B. F. Goodrich Co. The Goodrich products will henceforth be identified with the new name, the original company, however, remaining as the owning and operating concern.

Several officials of the Goodrich company, acting as individuals, have solved the high cost of living problem by fitting up a club house with accommodations for 50 men. The name of the new club is the "Chelsea" and its present members, numbering 20, find the cooperative plan of living more economical and also more enjoyable. The club house is three stories high, with ten large rooms and a dormitory occupying the entire third floor. It is reported that the Chelsea Club is the pioneer in a series of similar experiments for single men employees.

* * *

The metric system for determining weights and measures, standard in all European countries, has now been adopted by The

Goodyear Tire & Rubber Co., and classes in the Goodyear factory school have been organized among the foremen and inspectors of the plant, that they may become thoroughly familiar with the system before applying it to the activities of the factory. Our United States monetary system, with its decimal denominations, is really a division of the metric system, which has the same advantage over our old method of weights and measures with their units of inches, pounds, quarts, etc., that our system of coinage has over the pounds and shillings of Great Britain or the francs and sous of France.

Building operations may soon begin on Goodyear Hall, a \$450,000 building for the exclusive benefit of Goodyear employees. The size of the building will be 170 by 400 feet over all, the front four stories high and the rear two stories. An immense gymnasium, with a seating capacity of 5,000 and swimming pool adjoining, will provide opportunity for all kinds of indoor athletics, and there are to be school rooms, lounging, smoking and reading rooms, and complete equipment to supply the entire recreational needs of the large Goodyear working force.

The Goodyear company also has a fine athletic field of 40 acres, and Coach I. Ray Martin, for the past three years director of athletics at Heidelberg University, Tiffin, Ohio, has recently been appointed athletic director of the company.

* * *

At a stockholders' meeting on the tenth of last month, the capital of the Swinehart Tire & Rubber Co. was increased from \$800,000 to \$1,500,000, \$200,000 in common stock and \$500,000 preferred. The regular quarterly dividend was declared.

* * *

The Miller Rubber Co. has installed a new fire alarm system comprising the modern equipment of signaling apparatus with ten alarm boxes operated by breaking the glass and pulling the lever. These new call boxes and the factory whistle will automatically sound the number of the box four times in quick succession.

* * *

M. D. Tenney, for many years connected with the factory organization of the Kelly-Springfield Tire Co., has been appointed manager of the adjusting and salvage department, succeeding R. B. Pierce, now manager of the Cleveland branch.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

NEVER before has the National Guard in this vicinity been supplied with rubber overshoes. Last month, simultaneously with the declaration of war, New England was visited by a heavy snowstorm—one of the left-overs of last winter. It was deemed necessary to guard a number of points in or near Boston, and the inclemency of the weather, the soft, slushy condition of the ground where these men were picketed, and the fact that many of them were not supplied with shoes calculated to withstand such service, was quickly recognized, and at once orders were given to supply these soldiers with rubbers. The kind decided upon were heavy storm overs, and it was at once found that few such rubbers were in stock in the various wholesale houses. After considerable scurrying around, the Hood Rubber Co. and the United States Rubber Co. filled the order, and the sentinels were enabled to patrol their beats in greater comfort.

* * *

A proof of the growing interest in the history and methods of rubber manufacture is the steady demand by schools, colleges, clubs and debating societies for samples of rubber and compounding ingredients. Probably every rubber manufacturer has requests for such samples every week in the year. While an individual fulfillment of such a request would not be very great, even at present rubber prices, the aggregate cost of the large number would involve a considerable amount, both for material

and time. So great has been this demand that the Hood Rubber Co., Watertown, has seized the opportunity to popularize its products and make friends with the many persons or institutions asking for such favors and has had prepared an "Educational Exhibit." This consists of a neatly boxed card, to which are attached samples of various kinds of rubber, vials of the most prominent compounding ingredients and miniature aluminum boot and shoe lasts. These exhibits, which fill the wants of school teachers, are sold at a dollar each, and as they contain an advertisement of the company are, at the same time, of real publicity value.

* * *

The United States Rubber Co., having completed its pension plan, decided that the details should be given to the employees of its subsidiary companies by the officers of those companies. There are many employees in these companies who are of foreign birth, and some who might not fully understand that they were included among the prospective pensioners of the United States Rubber Co. An interesting feature of this announcement was the address given by Vice-President Ira F. Burnham at the Stoughton factory of the American Rubber Co. As several nationalities are represented among the workers there, Mr. Burnham called all the employees together and asked them to group themselves according to the language with which they were most familiar. An interpreter was stationed with each group and Mr. Burnham then explained in English, a paragraph at a time, the new pension plan. After each point was explained, the interpreters addressed their groups. Questions were propounded, which were answered by Mr. Burnham, and when all the groups fully understood this point, another was explained in like manner. The workers felt free to ask questions, as they would not be inclined to do, were the meeting formal, with only one speaker and he talking English on a platform. The plan was admirably conceived and excellently worked out, with the result that Mr. Burnham has been invited to explain the plan in other plants of the United States Rubber Co.

* * *

The Monatiquot Rubber Works Co., South Braintree, departed from its regular custom of celebrating its birthday, because of war conditions. In order that its employees might participate in the public celebration of Patriot's Day the factory was closed down. In posting notices in the various departments, notifying of the shut-down, announcement was made of a ten per cent increase to all who had been employed more than three months. The dedication of mill building No. 4, which had been arranged to be held April 19, was postponed, and if present plans are carried out, will take the form of an old-fashioned party given to the employees and their families.

* * *

Ten simultaneous flag raisings, one each on the ten principal buildings of the Boston Woven Hose & Rubber Co., Cambridge, on April 11, were accompanied by a procession of 1,750 employees, headed by a fife and drum corps, led by Vice-president and Manager George E. Hall, Treasurer Henry B. Sprague, Mayor Rockwood and the heads of the fire, police and building departments of the city of Cambridge. At the close of the parade the entire company assembled in the large factory yard, where, to the accompaniment of the fife and drum corps, and the factory bugler, the "Star Spangled Banner" was sung by all present.

* * *

The importance of air-brake hose was exemplified at the South Terminal Station in this city one day last month, when a large number of trains arriving in Boston were held from 15 to 30 minutes, causing a serious track congestion. A train was backing out of the station when the air-brake hose collapsed. This set the brakes on all the cars, and the only way to release the brakes was to do so with each individual car, a process which took half an hour to accomplish. This happened in that part of

the yard where many tracks converge or cross each other, thus holding up trains entering or leaving the station.

* * *

F. H. Appleton & Son, Inc., rubber reclaimer, has become a Massachusetts corporation, though originally incorporated under Maine laws. No change has been made, either in the list of officers and directors, or in the capitalization, which is \$400,000.

* * *

The trustees of the Forsyth Dental Infirmary on April 10 tendered the use of this establishment to the National Government, through Senator Lodge. The condition of soldiers' teeth is of prime importance in time of war, and this great infirmary, given to the City of Boston by a rubber manufacturer, is probably the finest of its kind in the world.

* * *

The Lynn Rubber Manufacturing Co. is now making an arch support for wearing in the shoe for the relief and correction of fallen arch, which is composed partly of sponge rubber, thus forming an elastic cushion, exerting a gentle pressure at the point needed.

* * *

Dan C. Swander, manager of the Boston store of the Firestone Tire & Rubber Co., resigned that position last month to become sales director of the Standard Parts Co., Cleveland, Ohio, a combination of several companies, including the Western Spring & Axle Co., the Perfection Spring Co., the Standard Welding Co., Cleveland, and the Bock Bearing Co., Toledo, Ohio. It is reported that the company will employ 8,000 to 9,000 men in the various plants and consume 175,000 tons of steel annually. Mr. Swander has been connected with the automobile and tire industry for a number of years, and has been very successful as a sales organizer and builder.

* * *

Jack T. Clinton succeeds Mr. Swander as manager of the Boston branch of the Firestone Tire & Rubber Co. For several months last year he was acting manager of this store, and later was appointed manager of the Buffalo branch of the company. His friends in the trade, and especially those in Boston, are congratulating him on his advancement and his return to this city.

* * *

Forty students of Harvard University, who are specializing in chemistry under the guidance of Professor Jones, made a tour of inspection of the Hood Rubber Co. factory at Watertown recently. Every office employe of the company is now wearing an American flag as an emblem of patriotism in this critical time, while every office is decorated with the Stars and Stripes.

* * *

The bowling league of the Hood Rubber Co., Watertown, celebrated the closing of the season by holding its sixth annual banquet at Convention Hall in this city, April 12, more than 300 being present. Prizes were awarded and the minstrel troupe furnished entertainment. This troupe also gave a special performance at Nutting's boathouse, on the Charles river, raising a goodly sum for the American Red Cross Society.

* * *

The Fisk Social and Athletic Association of The Fisk Rubber Co., Chicopee Falls, has offered to the United States Government, for mobilization purposes, its athletic field in Springfield. This park contains 45 acres, has stable accommodation for 150 horses, water from the city mains, is on a line of trolley cars and not far from two main line railroads from which a spur track could easily be laid. The Fisk Rubber Co. stands behind this offer to the Government, and if it is accepted, will provide an athletic field for its employes in some other location.

* * *

The Boston Chamber of Commerce has under consideration the creation of a Foreign Trade Bureau or a Foreign Trade Council.

A committee of five has been appointed to consider its feasibility and, if possible, to formulate a plan for such an organization.

* * *

The Converse Rubber Shoe Co., Malden, which manufactures tires as well as footwear, has increased its authorized amount of common stock from \$75,000 to \$375,000, and will use \$285,000 of the increase to pay a 380 per cent stock dividend. The remaining \$15,000 will be left in the treasury. The company now has \$1,375,000 preferred and \$375,000 common stock authorized.

* * *

The Para Rubber Co., dealer in tires and mechanicals, formerly at 112 High street, has moved to a larger store at 43 High street.

* * *

Francis H. Appleton has just returned from a vacation at Virginia Hot Springs, where he spent much time on the golf links, with the result that he weighs no more to-day than he did prior to his departure from Boston.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

GEORGE GRAHAM, JR., assistant treasurer of the Delion Tire & Rubber Co.; John Carter, plant superintendent, and Harry A. Pfitzinger, head bookkeeper, are at St. Francis Hospital in a serious condition as a result of an explosion and fire at the Delion plant. Thomas Curtis, employed as an expert machinist by the Thropp company, who happened to be at the tire factory when the explosion occurred, is also at the hospital. The men were terribly burned about the face and arms and it is feared some of them may not recover their sight.

These men, together with several mechanics, were assisting in or watching the frictioning of some stock, in the process of which a new compound was being used. They were watching the action of this compound when a spark from the machine caused an explosion. The compound was plastered into the faces of those nearest the machine. In another instant flames were shooting through the room and it was with difficulty the men were saved from being burned to death. A dozen workmen employed about the room were painfully burned. A large amount of stock in the room was ruined, but the flames did not disable the plant. This is the second fire to visit the Delion factory. The plant is unusually busy and a new addition is now under way. When this is completed it will enable the factory to double its output.

* * *

The Ajax Rubber Co. has taken possession of its extensive new factory addition, which relieves a badly congested condition at the main factory adjoining. The new plant enables this company to produce several thousand more tires and tubes annually.

A flag raising was held last week at the Ajax plant. The Second Regiment band provided music for the occasion. A company of militia was present, and several thousand people assembled to witness the ceremony.

* * *

The Z. Z. Tire & Rubber Co. will shortly begin to do its own compounding. The company has hitherto had this done at one of the Trenton rubber mills.

* * *

The Globe Tire Co. has removed its executive offices from Trenton to 1851 Broadway, New York City. The billing and a large part of the correspondence will be done in the future from the New York headquarters. This concern recently completed a three-story addition, 50 by 200 feet, for making tires.

* * *

The James E. Thropp Sons' Co., maker of rubber machinery, has given contracts for the erection of an office building to cost \$22,000. The building will be of tapestry brick and Indiana limestone. Fireproof vaults will be provided on each of the floors.

* * *

As a result of "Wire Your Home" campaign conducted by the

Trenton Electric Club, scores of Trenton homes are being wired for electricity. The campaign was successful far beyond the hopes of the club.

* * *

Work is progressing rapidly on the new plant of the Westinghouse Lamp Co. in North Trenton. The plant will cover several acres.

* * *

John A. Lambert, of the Acme Rubber Co., presided at a meeting held for the purpose of planning for the mobilization of Trenton's industrial establishments in view of war time needs.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

FOR many years the manufacture of rubber goods has been prominently identified with the industrial history of the State, but the past two years has materially increased its standing and it is now one of the six leading industries. Present indications point to still further expansion. Every plant is flooded with orders, many of them for immediate delivery; but the handicap of shortage of labor and the high cost of material are deterrent factors in necessary enlargements that would, under ordinary conditions, be made at once.

But the help proposition is not merely a local one, as the frequent advertisements in the want columns of the daily newspapers attest. These offer very alluring terms and conditions, which, however, have not proved sufficiently tempting to call any great number of operatives from the Rhode Island factories. One of the most recent calls has been from the Rubber Insulated Metals Corp., of Plainfield, N. J., for experienced tire makers, offering permanent employment at \$4.50 to \$5 a day. But local rubber concerns are also calling for additional operatives through the same mediums and there is no necessity for even an ordinary worker leaving Providence and vicinity for steady employment at good wages.

* * *

Maurice C. Smith, for several years assistant treasurer at the National India Rubber Co., Bristol, has been promoted to treasurer to succeed A. H. Emerson, who has become sales manager of the company's insulated wire department.

Alvin M. Bullock, who has been employed at the factory of the National India Rubber Co. for the past 20 years, during 18 of which he has worked in the outsole cutting department, has severed his connection with the company. During the latter period Mr. Bullock estimates that he has cut out more than six million pairs of outsoles. His associates presented to him a handsome gold monogram ring.

* * *

The employees of the Crocker System Rubber stores, of which the Hope Rubber Co., of Providence, and the Newport Rubber Co., of Newport, are a part, tendered a reception and dinner to Isaac Crocker, of Providence, at the Narragansett Hotel, that city, in honor of his sixtieth birthday on Easter Sunday. The occasion was devoid of all formality, although everyone present was called upon by the toastmaster, Henry J. Callahan, manager of the Salem store. To Mr. Crocker was presented a handsome silver loving cup by his employees, and during the festivities Charles P. Lanning ("Lan"), the famous cartoonist, drew character sketches. The Crocker System Stores represented on this occasion included Hope Rubber Co., Providence, Rhode Island; Worcester Rubber Co., Worcester, Massachusetts; Lawrence Rubber Co., Lawrence, Massachusetts; The Crocker Rubber Co., Brockton, Massachusetts; Granite State Rubber Co., Manchester, New Hampshire; Salem Rubber Co., Salem, Massachusetts; Haverhill Rubber Co., Haverhill, Massachusetts; Newport Rubber Co., Newport, Rhode Island, and Fitchburg Rubber Co., Fitchburg, Massachusetts.

* * *

Patriotism is manifesting itself throughout this State as never

before, and the employees of manufacturing plants of all kinds are vying with each other in the display of flags and the holding of patriotic exercises at the ceremonial raising. The various plants representing the rubber industry are among the establishments that have placed themselves on record. At the National India Rubber Co., Bristol, not only have large flags been placed in the several departments, but several hundred of the operatives have joined the Red Cross. On one day, recently, eight large flags were unfurled at the factory, six in the stitching room and two in the shoe room. Officers of the company were present and appropriate exercises were held in each room. Addresses were made and all joined in singing patriotic songs.

The employees of the Revere Rubber Co. held their flag raising on Patriot's Day, April 19, more than 1,000 of the employees being present at the celebration, each being presented with an American flag pin. The program included a medley of patriotic selections by an orchestra composed of employees and a very interesting address by W. T. Mead, dressed in Colonial costume, on the history of the American flag. At the conclusion of Mr. Mead's address bugle calls were sounded and "The Star Spangled Banner" was sung as the flag was unfurled. A salute was then given the flag together with a pledge of allegiance and the singing of "America."

* * *

Terence McCarthy, owner of the Narragansett Rubber Co., Bristol, who has been at St. Joseph's Hospital, Providence, for several weeks, returned to his home in Bristol about the middle of the month. He has been suffering from a complication of nervous troubles.

A new smoke-stack, 65 feet in height, has been erected at the main boiler room of the Narragansett Rubber Co.'s factory to replace the one blown down during a gale a few weeks previously.

* * *

A dozen or more young women fainted from excitement and fear early on the afternoon of April 5, as they were making their escape from the glove room of the Revere Rubber Co.'s plant on Valley street, after a bottle of strong acid had fallen to the floor in the chemists' room adjoining. They were taken to the factory hospital where they were treated. A fire was caused when the acid from the broken bottle mixed with other acids, and the flames spread rapidly, although they were soon extinguished. The damage did not exceed \$500.

* * *

The Empire Auto Supply Co., 86 Empire street, Providence, is owned and conducted by Maurice Greenwald, 611 West 127th street, New York City, and Edgar E. Cohn, Winchester Hotel, Syracuse, New York, according to their statement filed at the local city clerk's office.

* * *

Charles H. Frucht has filed a statement with the city clerk of Providence that he is the owner of the O. K. Cycle Shop, 371 South Main street.

* * *

The 'trade certificate of the Smith Webbing Co., doing business in West avenue, Pawtucket, was filed recently with the city clerk's office in that city. The name signed as sole owner is Everlastik, Inc., 52 Chauncey street, Boston.

* * *

Fourteen concerns submitted bids for 3,000 feet of fire hose, and contracts have been awarded by the Woonsocket City Council committee on fire department as follows: C. H. Darling Co., Woonsocket, 500 feet of Grey King brand, 90 cents a foot; Combination Ladder Co., Providence, 500 feet safety fire department wax and para gum-treated hose, 90 cents; Eureka Fire Hose Co., Boston, 1,000 feet at 67½ cents.

* * *

The New England Tire Co., 144 Fountain street, Providence, is being conducted by Victor P. Hendrick, 181 Magnolia street, Auburn, according to statement filed at the city clerk's office.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE somewhat panicky buying of rubber during the latter half of February did not go far in raising prices, which remain at much the pre-war level in contradistinction to most other raw materials of industry. Of course, if the largely increased output promised from the Eastern plantations for 1916 had not matured, no doubt we should have seen much higher prices owing to the war demand. As it is, this had neutralized the loss of the Central Empire's market and prevented what many predicted for 1917, viz., a slump in prices owing to over-production.

Outside government work it cannot be said that trade is very brisk and among exporters especially there is a feeling that a very quiet time is ahead. With the practical cessation of pleasure motoring the tire branch is, of course, greatly affected. A good deal of export trade, especially with Scandinavia, is much hampered by the lack of shipping facilities.

"RUBASTIC" AND RUBBER.

The legal case in which the late manager of the "Rubastic" works sought damages for dismissal, resulted in a verdict for the defendants, the directors of the concern. It was given in evidence for the defense that "Rubastic," which was supposed to be a non-rubber substance of substantial merit, really owed its merits to an admixture of rubber. This may or may not have been a fact, as the plaintiff denied this, but whether or no, the case calls to mind more than one proprietary non-rubber article which has made a fleeting appearance on the market in the past and, in which, when a legal case was the sequel to a dispute, it was shown that what merit the material possessed was due to a judicious admixture of the old established body, rubber. It is quite possible that "Rubastic" does not contain rubber as ordinarily made, but that its properties can be so improved by an addition of rubber that a super "Rubastic" has been made containing a proportion of rubber. The rather delicate question then arises as to how it ought to be designated. Goods which contain no more than ten per cent of rubber and a lot of substitute are regularly sold as rubber goods without any outcry being heard, though one of these days it may be enacted that the title shall be that of the major and not the minor constituent.

A FORERUNNER OF FUTURE LABOR PROBLEMS.

There have been many prophecies to the effect that most if not all of the belligerent countries are in for labor troubles after the war, mainly because of the disinclination of workers to take more normal wages than those which have been paid in the rush and stress of war goods production. The rubber trade has already had its beginning without waiting for the termination of hostilities. In a Northern police court a waterproofing firm claimed damages from some men who left without giving due notice upon being put on ordinary work because the government work at which they could earn more money had come to an end. It was stated, incidentally, that boys were earning up to \$8 per week. The case was decided in the manufacturer's favor.

WATERPROOFING INDUSTRY SCHEDULED BY THE GOVERNMENT.

The rubber manufacture, as also the waterproofing of material with non-rubber substances, have been scheduled by the Government as businesses of primary importance. This means that man power may not be compulsorily withdrawn so as vitally to affect the carrying on of any works, and also that new hands may be engaged as and when required. In the case of non-essential industries this cannot be done. Naturally there are many differing opinions among individuals as to whether particular trades are

or are not essential. Even in rubber manufacture it would be difficult to prove that all the output is essential.

EAST AFRICA PLANTATIONS.

At a recent meeting of the East Africa Rubber Plantation, Inc., with the Tewa Rubber Estates, Limited, the Kamna Rubber Estates, Limited, and the Muhesa Rubber Plantation, Inc., for the purpose of considering the policy to be pursued in the immediate future in what was formerly German East Africa, it was decided to amalgamate at the first opportunity. There is to be an independent valuation of the assets of each company and in the meanwhile the companies are to work together so as to effect the greatest economies in administration. The fact that in the last year the East Africa Rubber Plantation, Inc., expended only £50 shows that there is not much prodigality to subjugate.

THE RUBBERINE COMPANY, LIMITED.

At the annual meeting of this company it was announced that Edward Taffen had been appointed chairman in place of the Hon. A. R. S. Douglas, who is on active service. A. T. Marks, the manager, has been appointed managing director. A ten per cent dividend was declared. This progressive company, which has been located at Hornsey, London, has now practically completed a new works at Market Road, London, N.

MOTOR TRUCK RIDES FOR SOLDIER CONVALESCENTS.

A frequent sight in many of the large cities is a truck load of sick and wounded soldiers out for an airing. It has come

WOUNDED BRITISH SOLDIERS TAKING AN OUTING.

to be a common practice for many business houses to loan their trucks or automobiles for such purposes. A happy party of this kind is shown in the motor-lorry loaned by the London Good-year company.

THE INDIA RUBBER MANUFACTURERS' ASSOCIATION, INC.

Among the many changes which the war has brought about is a disposition on the part of manufacturers in various branches of industry to form combinations of individuals and firms so as to act collectively and to greater effect in matters affecting trade interests generally. This movement has embraced the chemical, iron and steel, pottery trades, etc., and now the rubber trade has come more or less into line by the incorporation of the above-

named association. It is limited by guarantee without any share capital and the membership is limited to 100, each liable for £1 in the event of winding up. Membership is confined to bona fide rubber manufacturers having their chief works in the United Kingdom. The first members of the Committee of Management are mainly those last elected to the committee of the late association, viz.: J. T. Goudie, Leyland & Birmingham Rubber Co., Leyland; Peter Bate, general manager, Castle Rubber Co., Warrington; P. A. Birley, Chas. Macintosh & Co., Inc., Manchester; F. H. C. Brooking, general manager, St. Helens Cable & Rubber Co., Warrington; Richard Eccles, general manager, F. Reddaway & Co., Manchester; James Henderson, Ancoats Vale Rubber Co., Inc., Manchester; David Moseley, David Mosely & Son, Inc., Manchester; James Tinto, Truell & Eastern Rubber Co., Inc., Manchester; F. Webster, Avon Rubber Co., Manchester.

A considerable accession of membership is reported during the last year or two and arrangements are being made to establish sectional committees in London and Glasgow. Among the many objects which the association has in view are the consideration of the terms and clauses in specifications issued by government departments and various public bodies; the encouragement of inventions likely to be of general utility to the trade; the encouragement of fresh sources of supply, of other necessary raw materials and the obtaining of adequate representation of the industry on trade boards.

WILKS BROTHERS WORKS ENLARGED.

Messrs. Wilks Brothers have almost completed the large extension to their premises at Booth street, Blackfriars, Manchester. Since the disastrous fire of 1913 the original premises were rebuilt with an additional story, but further extensions were subsequently necessitated. The firm manufactures waterproofs, rainproofs and oilskins, for the last of which the late S. Carter Bell had an agency in America where goods of this class do not seem to be so well known and popular as they are in Great Britain. Messrs. Wilks do a large business in motorcycle suits. In weatherproof cloth they have a specialty in their Aquarepel.

PERSONAL MENTION.

I record with regret the death of Colonel Herbert Hughes, of Sheffield, early in the year. The deceased, who was well known to a good many business people in America, was primarily connected with the steel trade but on the formation of the Xyler Rubber Co., Inc., of Manchester, four years ago he became one of the directors.

G. W. Leeson, who has been connected with the rubber heel manufacture in Manchester for some years, has now gone to London in connection with the Leeson Sponge & Rubber Co., Limited, of New Enterprise Works, Chiswick Road, London, W. Apropos of the rubber sponge I may say that retail prices of the American article have shown a sagging tendency, as general dealers are now competing with druggists in sales to the public.

William Somerville's Sons Rubber Co., Limited, is now the title of the Liverpool firm so long known in the reclaimed rubber trade as William Somerville's Sons. F. R. Burrows is the manager of the new company, having been associated with the business for many years. One does not hear anything of Mitchell's rubber nowadays, but those whose memory goes back 30 years or so when brands of reclaimed rubber were not so numerous in this country as they are to-day, will remember the time when Mitchell's rubber, as sold by Somerville's Sons, was a synonym for reclaimed rubber. Mr. Mitchell, of course, was an American who afterwards acquired an interest in Somerville's Sons.

A. Staines Manders, manager of the International Rubber and Allied Trades Exhibition, Limited, and Miss D. Fulton, secretary of the same corporation, are sending out a notice of the removal of their offices to Brownlow House, 51 High Holburn, London, W. C., which is also the headquarters of the Fulton-Manders Publishing Co., and the International Press Publicity Bureau.

THE RUBBER TRADE IN HOLLAND.

By a Special Correspondent.

THE Netherlands Overseas Trust has entered upon an agreement with rubber importers, which has caused great indignation among rubber manufacturers. By this agreement, the importers are to place at disposal for sale 300 tons of rubber, at 2.50 florins per half kilo [\$1.00 per 1.1 pounds], consisting of 75 per cent of prime and 25 per cent inferior qualities. The new regulation, ostensibly in the interests of manufacturers, further provides that the Trust shall decide whether applications are to be granted at all, the quantity to be allowed each applicant and the importer from whom rubber can be obtained. The whole quantity of rubber that has been allotted a certain manufacturer must be taken by February 1, 1918, and should delivery take place later, he will be charged interest at the rate of 5 per cent per annum and 50 cents per case per month warehouse fees and fire insurance premium.

The chief objections to this arrangement are that manufacturers are obliged to accept rubber which may or may not meet their requirements, the charges for storage and interest, and the high price of the rubber itself. To add to all this, the feeling exists that the measure was absolutely unnecessary, as manufacturers have never complained of any unwillingness on the part of the importers to release rubber for consumption.

A COURSE IN INDOLOGY.

What is expected to be of great benefit to the Dutch East Indies is the inauguration of a course in Indology by the board of directors of the Colonial Institute at Amsterdam. The object is to give suitable training for work, agricultural and otherwise, to those contemplating emigrating to the Dutch East Indies. The course will be held twice a year in Amsterdam, and the following subjects will be treated:

1. Essentials of the ethnology of the Indian Archipelago.
2. Introduction to the geography of the Dutch East Indies, with special regard to agriculture, mining, commerce and traffic.
3. Elements of the Malayan language.
4. Essentials of social conditions in the colonies.
5. The public institutions in the Dutch East Indies, with special regard to agrarian and labor laws.

In addition to these, quarterly courses will be given in:

- a. Tropical hygiene, diseases, personal hygiene and sanitation (especially on big plantations).
- b. Colonial products.
- c. If necessary, lectures on other colonial topics will be held.

It is expected that this course, which commenced March 2, will not only promote the actual knowledge of economic conditions in the colonies, but also a proper understanding, and thus better cooperation between the European and the Oriental in the Dutch Indies.

EMBARGO ON AUTOMOBILES.

The Netherlands Government has declared an embargo on automobiles. All shipping space has been requisitioned for foodstuffs and automobiles and other luxuries will not be accepted for shipment for some time.

DR. ITERSON RETIRES.

A royal decree to go into action November 1, has honorably discharged Dr. G. van Itersen, Jr., of the Technische Hoogeschool (Technical Academy), Delft, Holland, from his duties as director and supervisor of the Ryksvoorlichtingsdienst (Government's Information Service), in behalf of the rubber industry, and nominated him advisor to the same institution. Dr. A. van Rassun, now assistant, has been nominated director in his stead.

FIRST NETHERLANDS ANNUAL INDUSTRIAL FAIR.

On February 24, 1917, the official opening of the First Netherlands Annual Industrial Fair at Utrecht, took place, the Queen being the patroness. Of the 668 participants, 35 represented the leather and rubber industries. Owing to the war, there were no foreign visitors. Nevertheless, the enterprise has been declared a success and will be held in the spring of 1918.

INFANTS NIPPLES IN FRANCE.

The French law of April 6, 1910, prohibiting the sale and importation into France of certain tube feeding bottles has been extended so that it now also covers infants' "comforters" and nipples made of materials other than pure rubber, vulcanized by a process other than hot vulcanization, and not bearing, besides the manufacturers' or traders' mark, the special indication "caoutchouc pur."

AN EXCHANGE TO PROMOTE RUSSIAN-AMERICAN TRADE.

The newly established Russo-American Merchants and Manufacturers Exchange, Inc., with headquarters at 120 Broadway, New York City, aims to bring American producers and Russian consumers together, to familiarize each with the business methods of the other, and to establish a common ground for trade exchanges. The campaign among Russian consumers will take the form of a comprehensive directory of American industries in the Russian language, and which will be distributed throughout Russia to the number of 40,000 copies.

DENMARK PROHIBITS AUTOMOBILING.

The effect of the strict British censorship on all shipments of cars, gasoline and tires is being keenly felt in Denmark. Prices for gasoline are four to six times as high as in the United States, while few tires reach there. Under these circumstances, the Danish Government has thought it advisable to prohibit temporarily the use of passenger cars on the streets.

GERMANY WANTS BRAZILIAN RUBBER.

It would appear that Germany's difficulties in obtaining rubber will not be greatly diminished after the war. True, she intends to establish a rubber market for Central Europe at Hamburg when peace is restored. But, for a time, at least, she will hardly be able to import rubber from the British colonies, and Brazilian exporters are of opinion that a rubber market must be created in France. They think it absolutely necessary to establish in France a free port and a banking organization capable of freeing the Brazilian exporter and the French consumer from the monopoly exercised by the port of Hamburg until 1914.

CORKS FOR BICYCLE TIRES IN GERMANY.

Meanwhile, German ingenuity is being taxed to the utmost to find means by which the deficiency in rubber articles can be supplied, and experiments are being made with all kinds of substitutes.

According to the German paper, bicycles have become almost extinct in Germany since the seizure of rubber tires. Corks from wine bottles provide a substitute, however, about 100 being needed for both wheels at a cost of 2 to 3 marks. The corks should be of equal breadth, not tapering sharply, four to five centimeters long and about 23 thick. They are pressed tightly together and cemented to the rims of the wheels. Cork is very elastic, and although it has not the resilience of rubber, especially on rough pavements, when traveling on good roads it is quite satisfactory.

RUBBER MACHINERY DUTY FREE IN CEYLON.

A recent change in the tariff laws of Ceylon exempts from duty machinery intended for use in the manufacture of articles from crude rubber.

BRITISH INDIA.

The new tariff (No. 121) on rubber tires for motors and motorcycles, and rubber tubes for tires and other manufactures of rubber, not otherwise specified, is now 7½ per cent ad valorem.

Welfare work is on the increase in the Far East. The Bandar Rubber Co., of Sumatra, has appropriated a goodly sum for a vacation beach resort on Toba Lake for the benefit of its employees.

RUBBER TRADE IN HANKOW, CHINA.

HANKOW is an important city in northeast China, from which are exported hides, skins, silk, tea, cotton, nuts and other products of the soil. There are about 70 firms which do an export and import business. The following information, of interest to rubber manufacturers, is furnished THE INDIA RUBBER WORLD by Edwin S. Cunningham, Consul General, at that city:

At the present time rubber belting in 1 inch to 6 inch widths, rubber hose in 1 inch to 2½ inches diameters for steam and water fittings, and rubber packing in sheet form are the chief rubber articles imported into this district. The various jinrikisha firms also handle rubber tires, and some small amounts of rubber goods are carried in stock by the local motor car and accessory dealers and by the drug and druggists' supply houses.

According to statistics issued by the Chinese Maritime Customs, rubber and rubber goods were imported into Hankow to the value of \$7,918 (gold) during 1914; \$19,263 during 1915, and \$11,276 during 1916. Japan furnishes the bulk of these goods, with Russia second, Great Britain third, France fourth, Hongkong fifth, and the United States sixth. Tientsin acts as the chief market in China for rubber goods, with Manchouli second, Shanghai third, Dairen fourth, and Hankow fifth.

Rubber belting is not included in the above figures, as it is classed with the other varieties of belting. According to the Custom House statistics there was 93,460 tael [£77,412 U. S. currency] worth of machine belting imported into Hankow during 1916, of which, according to the commissioner, 80 per cent is of leather. The bulk of the remaining 20 per cent is made up of rubber and woven belting, but in what proportions I am unable to say.

Local dealers report that due to the climate of Hankow, which has a very deleterious effect on rubber articles, they prefer to buy their goods from Shanghai distributors and thus avoid the risk of keeping large stocks on hand which might be spoiled by the weather.

In consequence it would appear that the greatest opportunity for supplying the rubber market of this district lies in forming connections with some of the large importing houses of Shanghai, as that port acts as the chief distributing point for practically all of central China.

It might be advantageous for manufacturers of rubber goods desirous of entering this market to communicate directly with the various Hankow firms handling rubber goods, in which case the following list of local dealers will be found valuable for reference. To avoid repetition, American addresses are given in the numbered footnotes below:

BELTING. Anderson, Meyer & Co., Limited¹; Burtenshaw & Co.; A. Brandt & Co.; Carlowitz & Co.²; H. Deiderichsen & Co.³; Robert Dollar Co.⁴; Lothar, Marcks & Bush⁵; New Engine & Iron Works; F. Schwartzkopf & Co.; Westphal, King & Ramsay, Limited⁶; Chinese American Co.⁸; Neilsen & Winter China Engineering Co.

HOSE AND FITTINGS. Anderson, Meyer & Co., Limited¹; Burtenshaw & Co.; A. Brandt & Co.; Carlowitz & Co.²; H. Deiderichsen & Co.³; F. Schwartzkopf & Co.; Telge & Schroeter⁷; Neilsen & Winter China Engineering Co.

TIRES AND ACCESSORIES. (See also Jinrikisha, below). Arnhold, Karberg & Co.⁹; A. Brandt & Co.; H. Deiderichsen & Co.³; New Engine & Iron Works; F. Schwartzkopf & Co.; Weeks & Co.⁹; L. S. Wureh & Co.; Central Garage Co., Limited.

JINRIKISHA DEALERS. Star Rickshaw Co.; F. Ramello; Hankow Rickshaw Syndicate; Fook Kee & Co.; Tong Chong Bicycle Co.

GENERAL RUBBER GOODS AND SUPPLIES. Arnhold, Karberg & Co.⁸; Hankow Dispensary, Limited⁹; New Engine & Iron Works; Pharmacie Centrale; F. Schwartzkopf & Co.; L. S. Wureh & Co.; Chinese American Co.⁸.

American representatives or agents of these firms are:

- 1—Pacific Commercial Co., 50 Broad street, New York City.
- 2—Carlowitz & Co., 82 Beaver street, New York City.
- 3—Crossman & Sielcke, 90 Wall street, New York City.
- 4—Robert Dollar Co., 230 California street, San Francisco, California.
- 5—Irwin, Harrison & Crossfield, 90 Wall street, and G. Amsinck & Co., Hanover street, New York City.
- 6—Chinese American Co., 200 Devonshire street, Boston, Massachusetts.
- 7—H. Marquardt & Co., 35 South William street, New York City.
- 8—F. H. Erlinger, 60 Wall street, New York City.
- 9—Muller, McLean & Co., 11 Broadway, New York City.

* This firm imports only for its own needs in the sawmill business.

While these firms are all of good repute, the writer can accept no responsibility for them in any way. They can, do doubt, furnish references, and information as to their credit standing can be obtained from the local banks upon application by your bankers. Correspondence with them may be in English irrespective of their nationality.

THE SITUATION IN JAPAN.

By a Special Correspondent.

THE demand for rubber goods in Japan and Far East localities supplied by Japan is increasing rapidly. Such representative men as Chugo Moriya, a large dealer in general rubber goods, and Yoshio Kawashima, manager of the Oriental Rubber Cloth Co., agree that the demand in 1915 was fully double that in 1914. This was particularly true of electrical goods, jar rings, packing, air-cushions and raincoats. The latter were more of cotton costing about \$7.50 and less of silk than formerly, due perhaps to economies on account of the war. Exports to China and the South Sea islands showed a big increase.

RESTRICTIONS ON RUBBER EXPORTS.

Crude rubber and manufactured rubber goods imported from England and her colonies or elsewhere may not be exported from Japan except upon agreement with the British authorities. However, German agents in China, desiring to export such materials to neutral countries, found it convenient to ship them to our ports and place them in a bonded warehouse until a sailing to the desired port occurred. On January 27, however, a ruling of the Department of Agriculture and Commerce brought such goods into the prohibited list and presumably stopped this traffic. Unless the principle dictating the change be rigidly enforced, however, to prevent transfers in the offing or even on the pier but outside bonded warehouses, the efficacy of the new ruling is doubtful.

Although the Russian Government has purchased large quantities of rubber tires of Japanese manufacturers, the larger business in rubber toys and druggists' sundries has been lost through the Russian prohibition of all imports of luxury during the war.

RUBBER TOYS.

Japan has long been a great producer of toys, and it is not surprising that some of our rubber manufacturers should seek an outlet for their goods through similar channels. In the manufacture and sale of colored toy balloons Sadakichi Okuda, of Asakusa, takes the lead under the firm name of Sawadaya. Much of his product is sold abroad, the exports for March alone totaling 34,000 balloons valued at over \$7,500. In Tokyo his wares are sold by street venders, toward whom he has shown great benevolence. As he is said to be worth \$1,000,000, it has been possible for him to supply balloons to these poor men on extended credit which has enabled many of them to make a substantial start in mercantile life.

One of our leading manufacturers of rubber toys has recently placed on the market a novel globe bouncing ball with the various countries molded upon its surface. This, it is thought, will be pleasing as a plaything and instructive in geography as well.

JAPANESE PLANTATIONS IN MALAYA.

A noticeably better feeling is being manifested toward the Japanese in Malaya than hitherto. Those who first settled there, unfortunately, uneducated and without means, were held in contempt by both natives and white men, and it is not surprising that a like antipathy was felt toward the better classes of their countrymen who followed later. Government officials were regarded with suspicion, but when it was realized that legitimate business and not territorial ambition was the Japanese aim, and when our enterprise and progressiveness were observed, a friendly feeling began to develop which will make it possible for Japanese and British planters to cooperate for the good of the industry.

Since Mr. Akuzawa bought 300 acres on the Malay Peninsula in Johore in 1905, at a cost of \$100,000, Japanese planting interests have grown until now the invested capital aggregates \$7,000,000. Of the leased area, amounting to 110,000 acres, 50,000 acres are now planted and the 1916 production of rubber reached 2,230,000

pounds. The planted area is constantly increasing and will soon become 60,000 to 70,000 acres. Several plantations located on the west side of the Nafu River, about 80 miles from Singapore, are just reaching the tapping age. About 400 Japanese and 5,000 Chinese coolies are employed in this region.

An association of Japanese planters has been organized with a governing committee of 40 members representing each estate. Aside from activities directed toward expansion and general development, particular attention is being devoted to sanitary conditions and a well-equipped hospital on every estate. Cooperation, wherever possible, with British, Dutch and Chinese interests is one of the chief aims.

Our advantages as a people in rubber planting seem to outweigh our disadvantages. Of the former may be mentioned our ready adaptability to agricultural organization; the low cost of administration; our dependence upon rice as a principal food, which grows well, in the East Indies; the fact that we endure the tropical climate with ease, and that our Chinese and other laborers, being of similar race, trust us, despite slight differences in religion, manners and customs, so that superintendents and laborers work harmoniously together.

Our disadvantages lie in high interest charges on capital; the desire for quick successes and a tendency to be satisfied with small earnings; the absence of well-organized experimental and research work looking toward improved methods and product, and the lack of business combination and cooperative effort. Thus there is still much opportunity for constructive work for the common good of the industry.

RUBBER COMPANIES PROSPEROUS.

Toyojino Miyake, of the Nippon Rubber Co., reports a greatly increased business during 1915 in belts, balls and particularly automobile tires from the factory which was enlarged in September, 1915. The gross proceeds were over \$146,500 and the profits \$28,750, which were somewhat affected by the rising cost of raw materials. Medium quality tires of 26- and 28-inch size were in great demand. Balls were chiefly exported to China and Argentina. Some dolls were made, but only to special order.

The Settsu Rubber Co. earned profits of \$5,181 for the past year.

The profits of the Chiyada Rubber Co., of Tokyo, were \$11,347.

For the last six months of last year the Takasago Rubber Co. reported profits of \$2,538.

TRADE NOTES.

On the 43,200 square feet of land recently purchased, the Kakuichi Rubber Co. is now erecting an extension to its former factory which will cover 25,200 square feet. Machinery and general equipment will be modern in every respect.

The Teikoku Rubber Co. has been reorganized as a joint stock company with a capital stock of \$75,000 and will erect a new factory.

The Miyagawa Rubber Store has opened a foreign trade department at 34 Nichome, Yamatedon, Kobe, which will continue the export business of the firm and also engage in the importation of crude rubber, chemicals and other raw materials.

The Alenken Rubber Factory has purchased 14,400 feet of land adjoining its present site for immediate extension of the plant.

The building of the Kanae Packing Manufacturing Co. is nearly ready for occupancy at 601 Kitsu, Jomammamura, a suburb of Osaka. The output will consist of asbestos material, packing and rubber goods. Of the \$250,000 capital stock, \$62,500 has been paid in.

One of the leading spirits in the development of the Japanese rubber industry is Kenjiro Tsuji, managing director of the Chiyoda Rubber Co., who is bending his energies not only to his own firm's welfare, but to the rubber interests of the whole country as well.

The rubber industry of Osaka now comprises 58 factories em-

employing 416 men and 355 women. Both the Hirando Rubber Manufacturing Co. and the Ogata Rubber Store, of Osaka, have recently completed additions to their factories. The latter includes the best modern equipment for the manufacture of over-shoes and rubber heels.

Several new stockholders have increased the working capital of the Taiheigo Rubber Co. to \$6,000.

At the general meeting of the Asaki Rubber Co., a \$150,000 plantation firm, it was announced that its trees, valued at about \$116,000, are about to come into bearing.

A rubber horseshoe said to have three times the durability of an iron horseshoe has been patented by Gentaro Yameguchi.

The Taigo Rubber Co., 17 Kayabadio, Honjoku, has been re-organized with a capital of \$50,000 for manufacturing and selling rubber goods.

TAPPING METHODS.

AN interesting article, contributed by F. M. Riley to the "Planters' Chronicle," explains the various tapping methods employed by planters in Malaysia. He enumerates the four now employed on European-managed estates as follows:

- A. Basal V
- B. One cut one quarter
- C. Two cuts one quarter (same quarter)
- D. One third

The first mentioned (A) Basal V, is mostly employed on newly opening up, where a fairly large return per acre is desired.

(B). The one cut one quarter is chiefly employed on old trees, say 10 or 12 years old, where the preservation of the bark has become of vital importance.

DAILY TAPPING RECOMMENDED FOR ONE QUARTER CUTS.

(C). Two cuts one quarter (same quarter) are used when the tapping in the past has not been so drastic and the conservation of the bark not of such vital importance. Generally on old trees, the cuts can be 2 feet to 2 feet 6 inches apart, according to size of the trees. Alternate day tapping is strongly advised for this system.

THE ONE-THIRD METHOD CONSIDERED BEST.

(D). This, the one-third method, is the last referred to, and is considered the most important of all. It is a comparatively new practice and has stood all tests well. Under this system the amount of bark consumed is 17 per cent less than the Basal V, while the amount of latex differs only slightly, on some estates practically not at all, and on others not more than 10 per cent less. The exception is on young trees, and this is an advantage, as the Basal V for young trees is considered too severe a treatment, removing too much latex. It is possible that the one-third method may be adopted on the system of daily tapping, and come into general use both for old and young trees.

Great differences in estates are noted, especially in respect to soil, moisture, etc., and those exposed to the sea air are reported as not giving such good results as those located inland.

TAPPING KNIVES.

Regarding tapping knives it appears several kinds are in use and recommended, but the great art of good tapping is a sharp knife, and most coolies take two knives with them to the field, cutting half the job with one, and half with the other, the knives being resharpened at night by a professional, who gets about 50 cents per man per month, this being paid by the coolies.

This applies only to the Chinese, however, who are better paid than the Tamils. The latter sharpen their own knives. One of the duties of the assistant should be to test the coolies' knives at least 2 or 3 times weekly.

PERUVIAN EXPORT DUTIES.

The Peruvian government has imposed a duty of 2 centavos per kilogram of rubber exported through Iquitos, and a tax of 20 centavos per registered ton on ships clearing from that port.

NOVEL TAPPING KNIFE AND LATEX SPOUT.

THE tapping knife here shown presents many practical features of construction, and the fact that it has been in use for some

time on a large estate in the Far East lends interest to the device. A simple, fool-proof knife has been the object of tapping tool inventors, who have consistently endeavored to improve this most necessary plantation accessory.

As the cutting edge wears away in a comparatively short time, a replaceable, one-piece blade is necessary, and one that may not be loosened and its position changed at will by the

tapper. Referring to the drawings the fixed blade *A* is provided with a dowel pin, and a rivet hole at its upper end is attached to an ordinary wooden or metal handle. The loose blade *B* has two holes at its lower end for the dowel pin and rivet, by which it is attached to the fixed blade. The head of this rivet must be filed off when it becomes necessary to attach a new blade. The handle should, with ordinary use, outwear four or five blades.

AN IMPROVED SPOUT.

The ordinary latex spout is usually defective in that it may be driven too far into the tree, thereby causing a woody excrescence when the wound heals over. The spout here shown is constructed

with a shoulder that prevents this difficulty. The shoulder slopes downward at an angle of 45 degrees and has a depth of 3/16 of an inch. It is desirable that the end of the spout should be curved, and the correct depth should depend on the diameter of the tree,

the angle at which it is placed and the general curve of the spout. When the depth of the attaching end curve is correct it will always enter the bark at the same depth and remain firmly in a correct position.

The tapping tool was designed by A. Bailey and the latex spout by Donald Knapp, both of the General Rubber Company, Sumatra.

LEAF-FALL INVESTIGATION IN MALANG.

Investigations to discover the causes of abnormal leaf fall from *Hevea* trees have been made at the experiment station at Malang, but with no very definite results. In most cases heavy rains prevailed just before such leaf fall occurred. In some instances parasitic fungi have been found on the leaves. In Malang the fungus *Neozimmermannia elasticae* Kds. (*Gloeosporium elasticae* Massee) has been found in two cases of abnormal fall of young leaves, but artificial infection with pure cultures of this fungus has thus far given no definite result.

Dr. Arens advises that fallen leaves should be gathered at once and burned on the spot. If possible the affected trees and those nearby should be treated with fungicide. Trees thus treated should not be tapped, as they might produce tacky rubber because of the use of the fungicide.

Rubber Planting Notes.

RUBBER PRODUCTION IN SOUTH INDIA.

ACCORDING to Lucien Memminger, American Consul at Madras, India, the ten principal rubber plantations of South India produced over 3½ million pounds of rubber last year. A study of the detailed report showing the crops harvested in 1915 and 1916, and the estimates for 1916, indicates that in each case the 1916 yield was considerably above that of 1915; that on most estates the estimate has been considerably exceeded; that the Rani Travancore Co., which up to the end of 1915 was the largest rubber producing company in Southern India has now been displaced by the Malayalam Rubber Produce Co. With prices nearly approaching the average of 1915 and lower costs of production in most cases, some very substantial dividends may be expected. In this respect so far the Pudukad and Cochin companies are leading with interim dividends aggregating 40 per cent and 30 per cent, respectively.

RUBBER PLANTING IN SIAM.

Up to the present the rubber exports from Siam have not been very significant. On the only rubber plantation of importance in southern Siam 25,000 trees were planted about 6 years ago. Of these 20,000 are now ready for tapping. Considerable quantities of rubber are said to come from northern Siam, however. In the districts of Trang and Setul, Siamese Malay States, some attention is being given to rubber planting, but as far as can be ascertained, the production has, until now, been of little importance.

WEEKLY AUCTIONS AT MEDAN.

The Medan Produce Trade Association has decided to arrange to hold rubber auction sales weekly, instead of fortnightly, as is now the case. These sales may be private or public, according to the wishes of the sellers. Only members of the association will be permitted to take part in these sales, whether public or private.

A DEFECT COMMON IN SHEET RUBBER.

Sheet rubber frequently shows a dark line near and parallel to the edges. The cause of this has been investigated by Dr. P. Arens, who explains the cause as follows:

The cause of this line is a very simple one. The strength of the rubber, coagulated in the pans, is not the same in every part. The surface, which is exposed to the air, especially near the edges, is somewhat stronger than the rest.

When the sheet is rolled and insufficient precautions taken, this surface is less stretched than the other parts of the coagulum, with the result that the latter protrudes beyond the original margin of the sheet. This original margin retains its position a certain distance inside the newly formed edge and, since it was the hardest part of the coagulated mass, it is not so compressible as the rest and therefore forms a distinct ridge.

To avoid this, certain measures have to be taken, when putting the sheet through the rollers. The sheet must pass through the rollers in the same position it had in the coagulating pan, *i. e.*, the upper surface in the latter kept uppermost when put in the rollers. The sheet should be gripped by the rollers in the middle of the small side first, so that the edges pass through the rollers somewhat later than the middle. The edges must be turned down a little, whilst the sheet is passing through the rollers. If this is done, the margin of the sheet, hardened in the coagulating pan, will also form the margin of the sheet after rolling, and therefore no prominent line will be visible.

It is advisable not to fill the pans too full, as the prominent line will be more easily formed on a thick sheet than on a thin one.

A good material on which to train the coolies for this work is sheets the surface of which is darkened by oxidation in the coagulating pans. If these sheets are rolled in the proper manner, no white margin should be visible after rolling.

BELGIAN CONGO PROSPEROUS.

Despite the conditions imposed by the war, Belgian Congo prospers. The Governor General of the colony is reported to have said that the revenue is expected to show a surplus of 8,000,000 francs over the estimates in the current budget.

The figures for the rubber exports show a slight decline, 4,428,945 pounds in 1915 as against 4,892,166 pounds in 1914, but the increase in the price of rubber is again drawing the attention of buyers to the Congo product, the value of which had depreciated in 1914.

INCREASES IN THE GOLD COAST TRADE.

Figures for the trade of the Gold Coast show a decided increase, not so much in the quantities imported and exported, as in the values. The imports for the year 1915 amounted to £3,116,686, that is, 1 per cent less than in 1914, while the exports for 1915 were £5,814,810, or 30 per cent more than in 1914. The increased prices in all goods are largely responsible for these high figures and the profits are said to have been enormous.

The exports of rubber for 1915 were 647,982 pounds, valued at £25,167, as against 654,133 pounds valued at £21,631 in 1914, furnish a very fair illustration of the truth of the above.

GERMAN EAST AFRICA REOPENED FOR FOREIGN COMMERCE.

Communication with German East Africa is being gradually reestablished. The British Postmaster General has also announced the establishment of a parcel post service to the southern portion of German East Africa. All ships engaged in foreign commerce must clear at either Tanga or Dar-es-Salaam, on license of the British customs authorities.

PLANTATION RUBBER IN BRITISH GUIANA.

The Department of Science and Agriculture reports the area of rubber under cultivation for the year 1915 as being 4,687 acres, a decrease of 275 acres as compared with returns for 1914. This is due to the throwing out of areas planted with sapium rubber, as well as the abandonment of some small areas of Para rubber, the soils having proved unsuited for its cultivation.

Experimental tapping was continued at the Issorora and Onderneeming stations and for part of the year at Christianburg.

At Issorora the crop for the 12 months ending January, 1916, was 1,000 pounds of dry rubber (854 pounds biscuit and 146 pounds of other grades), obtained from 428 trees of from 5 to 7 years old, an average of over 2¼ pounds of dry rubber per tree.

In one experiment 300 trees, tapped by a man and a boy, yielded 873 pounds of dry rubber, which cost \$58.40 to collect, or less than 7 cents per pound. Most of the produce was sold in London in February, 1916, at a price of 81 cents per pound for biscuit and 68 cents per pound for scrap and other lower grades.

The latex of the other 128 trees was mainly used for the preparation of "ball" rubber by smoked coagulation, similar to the Brazilian method.

At Onderneeming the crop was 310 pounds of dry rubber (257 pounds biscuit and 53 pounds scrap, etc.). Part of this was sold in February, 1916, at 81 cents for biscuit and 68 cents for scrap.

At Christianburg 128 trees were tapped. One year's tapping yielded 201 pounds of dry rubber (161 pounds biscuit and 40 pounds scrap, etc.). A part sold in September, 1915, brought 56 cents per pound; the remainder realized in February, 1916, 81 cents for biscuit and 58 cents for scrap.

The results obtained at the experiment stations were, therefore, highly satisfactory. The same is said of the returns for 1916; the yields from the trees are very good and brought the highest prices.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MARCH 20, 1917.

- N**O. 1,219,502. Tire. C. I. Archer, Minneapolis, Minn.
 1,219,502. Water bag. E. J. Straus, St. Louis, Mo.
 1,219,577. Rubber patch for pneumatic tires. J. G. Moomy, Erie, Pa.
 1,219,653. Cushion tire. Ida I. McLeod, Lakeland, Fla.
 1,219,675. Life-saving pen. O. Shackelford, Farmont, W. Va.
 1,219,729. Valve stem gage with rubber tube. G. T. Hackley, Los Angeles, Calif. S. C. Hackley, administratrix of said G. T. Hackley, deceased.
 1,219,798. Wheel rim. O. H. Bartholomew, assignor of one-half to J. Halbrohr—both of Peoria, Ill.
 1,219,865. Tire gage. A. E. Pollock, Chicago, Ill.
 1,219,925. Automatic tire valve. F. A. Dean and W. H. Little, Alta Vista, Kans.
 1,219,948. Rim tool. G. A. E. Kaehler, Fresno, Calif.
 1,219,991. Rubber heel. F. A. Nolan, St. Paul, Minn.
 1,220,004. Collapsible rim. F. Rogers, Galveston, Tex.
 1,220,006. Closure for rubber receptacles. T. Rowe, Leytonstone, England.
 1,220,107. Tire tool. A. C. Hartman, Dillsburg, Pa.

ISSUED MARCH 27, 1917.

- 1,220,172. Teat cup. A. L. Berthelsen, Chicago, Ill.
 1,220,272. Tire gage. A. E. Pollock, assignor to Firex Manufacturing Co.—both of Chicago, Ill.
 1,220,282. Eraser. J. C. Smith, Kansas City, Mo.
 1,220,321. Device for expanding and contracting demountable rims. C. F. Corbett, Clear Springs, Md.
 1,220,372. Waterproof elastic fabric. A. C. Squires, assignor of one-half to John E. Wainwright—both of College Point, N. Y.
 1,220,471. Demountable rim. F. Spranger and N. M. Spranger, assignors to Spranger Rim and Wheel Co., a corporation of Detroit—all of Detroit, Mich.
 1,220,516. Segmental vehicle-tire. P. E. King and G. J. Wittmann—both of Newburgh, N. Y.
 1,220,541. Demountable rim. A. J. Park, Madison, Wis.
 1,220,568. Inner tube protector for pneumatic tires. G. Starke, New York City.

 1,221,721. Pneumatic tire carrying vehicle wheel. E. Gasper, Grass Valley, Calif.
 1,221,759. Pneumatic tire. J. B. Lynch, Syracuse, N. Y.

ISSUED APRIL 10, 1917.

- 1,221,852. Convertible and inflatable life belt. A. Gerley, Buenos Aires, Argentina.
 1,221,887. Making four-ply lock cord tires. R. M. Merriman, Akron, Ohio.
 1,221,888. Four-ply lock cord tire. R. M. Merriman, Akron, Ohio.
 1,221,912. Tire plug. R. W. Sampson, Whitestone, N. Y., assignor of one-half to L. Schwab, East Orange, N. J.
 1,221,978. Tire protector. H. R. Decker, Houston, Tex.
 1,222,070. Shoe for tires. W. L. Christian and P. Barker—both of Los Angeles, Calif.
 1,222,114. Surf diving and skimming device. J. P. McCarty and F. W. Falck; said Falck assignor to R. G. Matzene—all of Los Angeles, Calif.
 1,222,190. Recoil pad for fire arms. W. F. Dimelow, New York City.
 1,222,211. Tire fastening device. F. P. Johnson, Danville, Pa.
 1,222,283. Vehicle tire. M. Gray and B. Harris—both of New York City.
 1,222,291. Recoil rubber pads for firearms. S. A. Huntley, assignor to The Huntley Manufacturing Co.—both of Omaha, Nebr.
 1,222,467. Garter. L. L. Rogers, Boston, Mass., assignor to E. C. Moore, New York City.
 1,224,494. Bust developer. J. T. Thomas, Clarinda, Iowa.
 1,222,508. Life saving vest. M. Zawada, Cleveland, Ohio.
 1,222,542. Demountable rim. J. W. Drummond, Chillicothe, Ohio.
 1,222,555. Fountain pen. A. P. McArthur, Chicago, Ill.
 1,222,563. Ground mat. N. Rosenberg, assignor of one-half to C. Schaefer—both of Chicago, Ill.

THE UNITED KINGDOM. PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

ISSUED MARCH 7, 1917.

- 15,770 (1915). Corsets and abdominal belts having elastic sections. F. G. Baugatz, 37 Boulevard des Capucines, Paris.
 15,844 (1915). Inner tube. C. H. Mav, 37 Prospect Road, Moseley, Birmingham.
 15,866 (1915). Safety harness for aviators consisting of a belt of elastic webbing. H. L. Short, A. E. Short, and H. O. Short—all of 56 Prince of Wales Mansions, Queens Road, Battersea Park, London.
 15,881 (1915). Protected pneumatic tire. J. A. Andrews, St. Margaret's Hotel, Osborn Road, Jesmond, Newcastle-on-Tyne.
 15,904 (1915). Sleeve for insertion between tire tube and cover. W. C. Sneyd, 144 Broad street, Pendleton, and H. E. Young, 32 Broadway, Withington—both in Manchester.
 15,959 (1915). Demountable rim. Standard Welding Co., West 76th street, assignees of R. S. Bryant, The New Amsterdam, cor. of Euclid avenue and East 22nd street—both of Cleveland, Ohio, U. S. A.
 15,962 (1915). Wading boot. R. D. Carson, 1 Victoria street, Newton Stewart—both of Wigtownshire.
 16,002 (1915). Pneumatic tire tread. R. G. Wooten, 141 Walmer Road, Toronto, Canada.
 16,046 (1915). Sock-suspenders. R. K. Guinzburg, 725 Broadway, New York City, U. S. A.
 103,077. Detachable rim. W. E. Copithorn, 49 North Main street, Natick, Massachusetts, U. S. A.
 103,081. Solid rubber tire. G. A. Mortier, 5 Hall Road, Fulwood, Preston, Lancashire.
 103,100. Life-saving device. C. Thomas, 33 Tynycoed Terrace, Thomastown, Tynycoed, Glamorganshire.

ISSUED MARCH 14, 1917.

- 16,126 (1915). Leggings made of waterproof material. G. G. Smith, 89 Kensington avenue, Manor Park, London.
 16,193 (1915). Nipples for nursing bottles. F. C. Jones, 24 Belvedere Road, Upper Norwood, London.
 16,219 (1915). Tire valves. R. S. Burn, The Poplars, Wylde Green, Birmingham.
 16,264 (1915). Club or cane having a core of wire and a body part of rubber. E. E. Welfen, 5 Gruners Gate, Christiania.
 16,282 (1915). Rubber or balata driving belts. A. Carlsen, 1 Badstuestraede, Copenhagen.
 16,326 (1915). Rubber tip for crutches. C. Douglas, 303 Waterloo street, Oldham.

- 103,171. Tubeless pneumatic tire. C. V. Boys, 66 Victoria street, Westminster.
- 103,187. Pot for disinfecting dental and surgical instruments, provided with a rubber pad. F. G. Mordaunt, 49 Clark-grove Road, Sheffield.
- 103,256. Detachable rim. C. L. Kennedy, 1305 Ingraham street, Los Angeles, California, U. S. A.

ISSUED MARCH 21, 1917.

- 16,426 (1915). Wheel tires. J. Taylor, 15 Lord Byron street, Eccles New Road, Salford, Lancashire.
- 16,517 (1915). Rubber fly swatter. G. W. Gomber, Conyngham, Pennsylvania, U. S. A.
- 16,503 (1915). Rubber or gutta percha combined with leather in shoe soles. H. E. G. Bateman, 18 The Western Broadway, King street, Hammersmith, and J. T. Barkwith, 10 Bramber Road, West Kensington—both in London.
- 16,539 (1915). Wheel in which annular rubber cushions are secured between and to the sides of the spoke ring and flanges on the axle box. A. E. Russell, 77 Henry street, Windsor, and W. G. Charley, 454 Collins street—both in Victoria, Australia.
- 16,579 (1915). Combination cushion and pneumatic tire. R. Blakoe, 62A Queen's Road, Bayswater, London.
- 16,589 (1915). Fountain pens. L. E. Waterman & Co., 173 Broadway, New York City, assignees of E. F. Britten, 21 Van Reipen avenue, Jersey City, New Jersey, U. S. A.
- 16,612 (1915). Convertible waterproof covers. W. B. Robeson, Port Huron, Michigan, U. S. A.
- 16,665 (1915). Reservoir pens. C. Bristow, The Chestnuts, Brockley View, Forest Hill, London.
- 16,676 (1915). A trench boot or wader. J. S. Kruse, Regent Palace Hotel, Piccadilly Circus, London.
- 16,750 (1915). Rubber-covered artificial feet. G. Hardman, "Belmont," Audenshaw Road, Audenshaw, Manchester.
- 103,304. Pneumatic tire casing. P. Nivet and J. B. Haegy, Luxé (Charente), France.
- 103,335. Diaphragms with vulcanite attachments for telephones. T. Chalmers, 81 Underwood Lane, West street, Crewe, Cheshire.
- 103,348. Tire formed of alternate layers of plain and spongy rubber enclosed within a plain rubber cover. A. A. Crozier, 3 Woodquest avenue, Herne Hill, London.

ISSUED MARCH 28, 1917.

- 16,841 (1915). Respirator with rubber bands for attaching to wearer's head. F. Morris, "Lea Hurst," Willows avenue, Lytham, Lancashire.
- 16,849 (1915). Diving suit. Neufeldt & Kuhnke, Werk Ravensberg am Habsburger Ring, Kiel, Germany.
- 16,851 (1915). Crutches having inflated tubes in arm pads and foot. J. C. Roberts, Mercantile Bank of India, 15 Gracechurch street, London.
- 16,900 (1915). Multi-core cable. J. H. Bowden, 101 Eltham Road, and H. F. J. Thompson, 65 Cambridge Mansions, Battersea Park—both in London.
- 103,412. Crutch with inflatable rubber bag upon the top of the crutch head. A. R. Hunter, Pine Lodge, Welbeck, near Worksope, Nottinghamshire.
- 103,434. Life-saving attachment. S. Goldreich, C. A. McKerrrow, T. G. Jacobs and Life Saving Device Syndicate, Basilston House, Moorgate street, London.
- 103,452. Spring wheel with rubber block tire. W. E. Supernaw, 380 Alexander avenue, Elgin, Illinois, U. S. A.
- 103,471. Double-ended inner tube. Miller Rubber Co., assignees of F. Felton—both of Akron, Ohio, U. S. A.
- 103,478. Tire inflating valves. M. C. Schweinert, 226 Palisade avenue, West Hoboken, New Jersey, U. S. A.
- 103,485. Hand tools for artificial arms comprising a rubber-faced arm section. Siemens-Schuckertwerke, Siemensstadt, near Berlin.
- 103,491. A safety pocket closing device comprising an endless elastic band. J. W. Hawkins, Munfordville, Kentucky, U. S. A.
- 103,522. Tire inflating valve. T. Sloper, Southgate, Devizes, Wiltshire.

THE DOMINION OF CANADA.

ISSUED DECEMBER 30, 1916.

- 173,613. Hoof pad. E. Kempshall, Atlantic City, New Jersey, U. S. A.
- 173,619. Pneumatic tire. A. M. Kobiolké, Kew, near Melbourne, Victoria, Australia.
- 173,663. Pneumatic tire. R. G. Wooten, Toronto, Ontario.
- 173,736. Pneumatic tire. J. C. Anderson, Washington, District of Columbia, U. S. A.
- 173,748. Rim for pneumatic tires. G. Cassidy, New Westminster, British Columbia.
- 173,761. Demountable rim. H. E. Doebler, Cannon Falls, Minnesota, U. S. A.
- 173,771. Flexible rim. O. Gingras, Laurierville, Quebec.
- 173,795. Resilient tire. J. La Plant, Malone, New York, U. S. A.
- 173,818. Metal filler for pneumatic tires. C. M. Nevins, Hill-dale, Michigan, U. S. A.
- 173,821. Cushion tire. W. H. Overmoyer, Roselawn, Indiana, U. S. A.
- 173,838. Clincher tire rim. D. H. Shapiro, Montreal, Quebec.
- 173,852. Inner tube. E. W. Wilson, Springfield, Illinois, U. S. A.
- 173,853. Tire rim. E. W. Wilson, Springfield, Illinois, U. S. A.
- 173,854. Pneumatic tire. E. W. Wilson, Springfield, Illinois, U. S. A.
- 173,860. Tire rim. P. S. Whiting, Detroit, Michigan, U. S. A.

- 173,861. Tire rim. P. S. Whiting, Detroit, Michigan, U. S. A.
- 173,913. Spring and rubber cushion tire. H. L. McNeill, Truro, Nova Scotia.
- 173,960. Garter. M. B. Hammond, Bridgeport, Conn.
- 173,964. Rim tool. M. M. Herman, Danville, Virginia, U. S. A.
- 174,062. Garter. G. Abraham, New York City, assignee of H. E. Grabau, Long Island City—both in New York, U. S. A.
- 174,080. Tire tread. R. Aue, Leon Springs, Texas, U. S. A.
- 174,137. Spring and rubber cushion tire. B. A. Lange, St. Louis, Missouri, U. S. A.
- 174,143. Cushion tire. J. Milne, New York City, U. S. A.
- 174,232. Pneumatic tire. E. Knechtel, Toronto, and A. Snelgrove, assignee of a third interest, Fort William, Thunder Bay District—both in Ontario.
- 174,247. Demountable rim. I. D. Walter, assignor; J. G. Gant and T. Flournoy, each one-twentieth of the interest; J. W. Gant and S. A. Latimer, each one-fiftieth; and B. F. Cole, one-tenth, and to J. Brunkehoff, fifty-three one-hundred and fiftieths of the interest—all of Harrisburg, Arkansas, U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 481,922 (May 31, 1916). Metal tire. C. Montanari.
- 481,929 (June 2, 1916). Improvement in tools for removing tires. A. A. Friestedt.
- 481,937 (June 3, 1916). Pneumatic tire with envelope composed of a number of removable elements. P. E. Van Berendonck.
- 481,954 (June 5, 1916). Improvements in pneumatic tires. G. Ishihara.
- 481,955 (June 5, 1916). Insulators for storage batteries. India Rubber Co.
- 481,966 (June 7, 1916). Valve for pneumatic tires with device for indicating the air pressure. Ashelman and Johnson.
- 482,032 (June 14, 1916). Elastic wheel for vehicles. J. Duran-Pinana.
- 482,058 (June 16, 1916). Improvements in hollow tires. W. Humphrys.
- 482,073 (June 19, 1916). Apparatus for removing the insulating sheath from electric wires.

AUSTRALIA.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 305 (February 14, 1916). Contrivance to prevent capillary attraction of waterproof garments. W. H. Poppleston for R. H. Popplestone, England.
- 950 (May 6, 1916). Improvements in tire valve caps and analogous devices. Schrader's Son, Inc., for H. P. Kraft, New Jersey, U. S. A.
- 951 (May 6, 1916). Improvements relating to washers for tire valve caps. Schrader's Son, Inc., for H. P. Kraft, New Jersey, U. S. A.
- 1081 (May 25, 1916). Improvements in pneumatic tires. C. Phillips and V. Sudakeff, New South Wales.
- 1735 (August 8, 1916). Pneumatic tire cover to prevent cavities between the inner and outer casings when they are combined. S. R. V. Clifford, Victoria.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, etc., required by the Act of Congress of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, N. Y., for April 1, 1917.

STATE OF NEW YORK }
 COUNTY OF NEW YORK } ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. MacPhee, who having been duly sworn according to law, deposes and says that she is the Business Manager of THE INDIA RUBBER WORLD, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.

Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

Managing Editor, None.

Business Manager, E. M. MacPhee, 25 West Forty-fifth street, New York City.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.) Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by her.

E. M. MACPHEE, Business Manager.

Sworn to and subscribed before me this 31st day of March, 1917.

[SEAL]

FREDK. SPRENGER.

Notary Public, Westchester County.

Certificate filed in New York County.

New York County Clerk No. 188. Register's No. 8226.

(My commission expires March 30, 1918.)

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[291.] An inquirer seeks a manufacturer able to make a special type of automobile tire.

[292.] An inquiry has been received for Holland cloth.

[293.] Names and addresses of manufacturers of spreading and doubling machines are requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A merchant in Nicaragua desires to purchase garters and sleeve supporters. Report No. 24,056.

Samples and quotations from American manufacturers and exporters of suitings for rainproof capes are desired by a firm in the Dutch East Indies. Report No. 24,112.

A manufacturer in Spain is in the market for machinery for making rubber balls and other rubber articles. Report No. 24,125.

A firm in Chile wishes to buy elastic goods, garters and other accessories used in making corsets. Report No. 24,139.

A firm in Spain is in the market for tire presses. Report No. 24,166.

An agency for the sale of vulcanized rubber goods is desired by an applicant in Peru. Report No. 24,168.

A company in China wishes to receive catalogs, prices, etc., from American manufacturers of druggists' sundries. Report No. 24,180.

An applicant in Denmark desires to purchase or secure the agency for the sale of rubber goods, such as automobile and bicycle tires, inner tubes, boots and shoes, air and water cushions, gloves, tennis balls, football bladders, combs, sponges and sponge bags. Report No. 24,201.

A firm in the United States, representing firms in Mexico, Porto Rico, Spain, Australia and Switzerland, is in the market for electrical supplies and hard rubber razor handles. Report No. 24,215.

Representation of American manufacturers and exporters of automobile tires and accessories is desired by an applicant in Spain. Report No. 24,252.

An agency is desired by a man in Switzerland for the sale of rubber and rubber goods. Report No. 24,270.

A COMMERCIAL ATTACHE AT TOKIO.

The recent appointment of Frank R. Rutter as commercial attaché at Tokio directs attention once more to our increasing staff of so-called "trade diplomats" through which the United States hopes to improve its commercial relations abroad. Our broadening trade opportunities were recognized by the Government soon after the outbreak of the European war and attachés have since been stationed at London, Paris, Petrograd, Peking, Melbourne, Buenos Aires, Rio de Janeiro, Lima and Santiago, Chili. The growing importance of American trade with Japan has led to another similarly happy appointment by Secretary Redfield. Mr. Rutter is well fitted for the post, having been assistant chief of the Bureau of Foreign and Domestic Commerce, in charge of the statistical, editorial, foreign tariff and cost of production work of the Bureau. He has an intimate knowledge of the tariff laws of foreign countries and the methods of administering them, and for several years has been a lecturer on commerce in several universities, including Johns Hopkins, of which he is a graduate.

The United States Post Office authorities have declared the Double Service Tire & Rubber Co., Akron, Ohio, fraudulent and are returning to the writers all mail directed to this concern.

Review of the Crude Rubber Market

Copyright 1917.

NEW YORK.

CRUDE rubber business during the past month has been considered fair in some quarters, while in others trading has been reported as dull and featureless. While considerable turn-over business has been freely indulged in by the dealers forming the bulk of the month's transactions, the manufacturers have covered their immediate requirements by quietly picking up small lots. The war declaration was followed by a very firm undertone and stiffer prices that seemed to pre-empt the advance forecasted by the bull element. However, the movement lacked support and the market eased off without recording price changes worthy of mention. Even the report of a government tax on crude rubber failed to stimulate the dormant buying interests; however, later it was reported that the war revenue measure would not include crude rubber.

The scarcity of bottoms and the unfavorable financial conditions in the Far East are delaying direct shipments, four months being required for cargoes *via* Pacific Coast ports. Moreover, the preference given by the railroads to necessities, such as foodstuffs, military supplies, etc., has resulted in holding rubber arrivals at Seattle and San Francisco. Spot stocks appear to be cleaned up and nearby is getting very scarce. Arrivals are slow and the shipping situation continues to grow steadily worse. During the month several direct New York shipments from the East were diverted to Liverpool and London, a fact that still further shows the lack of bottoms. Freight rates from Colombo have advanced, and the insurance on London shipments is now 5 guineas the ton, equivalent to \$25 United States money.

Plantation prices have shown very little change during the month. April 1 first latex and smoked sheet ribbed, spot, were quoted 81 cents; April-May, 79 cents, and July-December, 73 cents. Upriver fine spot was 76½ cents. Steady conditions prevailed during the month, with minor price changes and on April 27 first latex and smoked sheet ribbed, spot, were 82 cents; May-June, 80 cents, and July-December, 75 cents. Market conditions very firm. The knowledge that there is plenty of rubber at producing centers is having a steadying effect on the market that would otherwise be adversely influenced by the shipping situation. Africans have received but little attention, while Centrals, particularly during the last week of the month, were in active demand.

LONDON.

Quiet conditions have ruled the London market during April; however, the undertone has been generally steady. Conservative buying has characterized the trading that lacked in volume, due to the absence of real interest. The effect of America's entry in the war was watched with interest in London, and when the active buying that was expected did not occur the trade settled down to watchful waiting. Prices, show very little change for the first three weeks of the month, holding around 75 cents for first latex and smoked sheet ribbed. On April 27 the standard plantation grades were quoted 36d., or about 72 cents in a very firm market.

The following estimate of the world's production and consumption of rubber during the next four years is by C. A. Lampard, the well-known rubber prophet, now deceased:

Year.	Production.	Consumption.
1917.....tons	235,000	230,000
1918.....	265,000	260,000
1919.....	295,000	290,000
1920.....	314,000	312,000

No allowance has been made in these estimates for the German and Austrian post-war demand, which is not expected to be less than 26,000 tons per annum. Apart from this it will be seen that during the four years in question it is thought that supply and demand will remain very nearly balanced.

London imports for February were 4,748 tons, compared to 6,364 tons for January. Re-exports were 5,043 tons, compared to 4,473 tons for January. Liverpool imports for February were 2,410 tons, compared to 1,215 tons for January. Re-exports were 1,331 tons, compared to 976 tons for January.

SINGAPORE.

The cables from Singapore indicate a good demand for all grades. At the auctions, held March 30, April 6, 14 and 21, the average prices obtained were as follows: First latex, crêpe, 68.6 cents; smoked sheet ribbed, 68.9 cents. The total amount sold was 2,105 tons.

COMPARATIVE NEW YORK PRICES FOR APRIL.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"During the early part of April the demand for commercial paper continued to be strong, the best rubber names selling at 41.65 per cent, and those not so well known 50.51 per cent, but since the middle of the month the demand has fallen off considerably and rates are rather higher."

April 21	68.00	68.00	438	Dull with a downward tendency.

WEEKLY RUBBER REPORT.

Guthrie & Co., Limited, Singapore report, March 8, 1917.

At the weekly rubber auction held yesterday and today a further advance in the prices of standard grades was registered. Fine ribbed smoked sheet fetched up to \$175 per picul for one lot, being \$3 above last week's best. The highest paid for fine pale crepe was \$174, an advance of \$4. Of unsmoked sheet only the better quality lots were in demand, and a considerable quantity was bought in. Brown crepes sold well, at about last week's prices, but dark and barky crepes were neglected, and suffered a decline in values. Demand throughout was somewhat erratic, and eased off towards the end of the sale. The quantity sold was 580 tons, out of a total of 864 tons catalogued.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked	\$168@175	3/ 234@3/ 4 1/4	71.40@74.37
Sheet, good ribbed smoked	140@167	2/ 8 7/8@3/ 2 5/8	59.50@70.97
Sheet, plain smoked	132@146	2/ 7 1/4@2/ 10 1/8	56.10@62.05
Sheet, ribbed unsmoked	133@135	2/ 7 3/8@2/ 7 7/8	56.52@57.37
Sheet, plain unsmoked	105@135	2/ 1 1/2@2/ 7 7/8	44.62@57.37
Crepe, fine pale	170@174	3/ 3 1/4@3/ 4	72.25@73.95
Crepe, good pale	154@170	2/ 11 7/8@3/ 3 1/4	65.45@72.25
Crepe, fine brown	140@153	2/ 8 7/8@2/ 11 3/8	59.50@65.02

Casamance	123,523	37,289
Ivory Coast	254,015	75,770
Madagascar	16,947	48,106
Manicoba	139,582	188,870
Indo-China	1,737	202
Palata	259,570	130,956
Totals	4,021,133	1,704,282

These figures include only direct importations from producers. Stocks on hand, December 31, 1916, totaled 130 tons.

THE MARKET FOR RUBBER SCRAP.

Copyright 1917.

NEW YORK.

THE active demand that was anticipated after hostilities with Germany were definitely announced has failed to materialize. In fact, the past month was very quiet in the rubber scrap market and prices have not undergone any material change. The usual spring arrivals have been held up by shipping difficulties that continued to interfere with the movement of supplies. The consuming trade has shown small interest in the market and buying has been confined to small lots for immediate requirements. The tendency in all quarters is to await the outcome of the unusual conditions prevailing at this time.

BOOTS AND SHOES. There was very little attention paid to this material during the month, and while the delivered price was nominally held at 9 cents, dealers were asking 9¼ cents. Trimmed arctics received moderate attention early in the month but later became dull and the prices recorded show no change from last month's report.

TIRES. The lack of demand for white G. & G. tires has resulted in easier prices and quotations for this grade are around 7½ cents delivered. Mixed tires have been fairly steady at unchanged prices. Solid tires have been in moderate demand at prices ranging from 6 to 6½ cents.

INNER TUBES. This material has become easier, due, no doubt, to the steady position of crude rubber. No. 1 tubes are now 25½ cents delivered as compared to 26 and 27 cents quoted a month ago.

MECHANICALS. There has been a fairly good call for garden hose and prices show an advance of about ½ cent a pound since last month. The other grades have received no attention, and prices have remained unchanged.

London and Liverpool imports of waste and reclaimed rubber for February were 38,000 pounds against 538,400 pounds for January. Reexports for February were 63,600 pounds against 1,417,800 pounds for January.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

Copyright 1917.

THE entry of this country in the war materially increased the buying movement that was in evidence early in April when middling cotton was quoted 19.35 cents for spot. War stimulation soon carried the market over the 20-cent mark, and on April 9, middling spot cotton was selling at 20.15 cents with July futures at 21.40 cents. Since then the market has been nervous and unsettled, traders showing a pronounced tendency to await developments. As the month progressed there was less demand for spot cotton and prices softened, 20.05 cents being the quotations on April 26.

EGYPTIAN COTTON. An extraordinary demand for Egyptian has characterized the April market. The extremely small spot stocks available and the British embargo have complicated the situation. Direct shipment in American bottoms appears to be the only relief and is hopefully looked forward to by the consuming trade. Prices are extremely high, the best grades of Sakellarides have sold as high as 70 cents during the month. For the period, August 1 to March 14, 1917, 105,215 bales were exported from Alexandria to the United States, against 173,033 bales for the same period a year ago. Mail advices from Alexandria, dated March 23, state that all business with America has stopped and no arrangements for direct shipments have been made.

SEA ISLAND COTTON. There has been a steady demand during the month, but business has been restricted by the scarcity of stocks. Prices have advanced steadily and quotations are difficult to obtain; however, sales at 75 cents have been reported. For the period, August 1 to March 30, 1917, 86,178 bales were shipped from southern ports, as compared to 63,225 bales for the same period last year.

TIRE FABRICS. Business has been brisk, the matter of delivery being the paramount question. The mills are all sold up to the end of the year and some contracts with consumers cover part of next year's requirements. The scarcity of Sea Island and Egyptian staples has created an active demand for Peeler fabrics. The cord fabrics made of cabled yarn are particularly in favor at this time. Standard 17¼-ounce Sea Island and Egyptian building fabrics have advanced about 5 cents a square yard and all indications are for higher prices.

SHEETINGS, DRILLS AND OSNABURGS. All grades have been in heavy demand with the question of delivery being the controlling factor. Prices have advanced in the entire list from 1 to 3 cents a yard.

HOSE AND BELTING DUCK. Government requirements have greatly stimulated this material by the call for large quantities of army duck. Prices on mechanical duck have advanced about 5 cents a pound during April and higher levels are predicted for the future.

RUBBER IN AIRCRAFT CONSTRUCTION.

IN a lecture recently delivered before the Aeronautical Society, London, Captain G. S. Walpole remarked that materials, other than metal, used in aeronautics were less satisfactory, owing to the fact that they are more easily influenced by time, temperature and humidity, and that the best results cannot be obtained with the same directness and precision of forecast.

He showed that in such rubber parts as shock-absorbing devices and tires in airplanes, not only shape, size and arrangement were to be considered, but also the composition and properties of the material. In this connection, he complained of the lack of co-operation between rubber manufacturers and aircraft designers, instancing the ignorance of manufacturers as to the work required of shock-absorbers. The ideal shock-absorber, he asserted, should be like a "pudding," which gives to a load and slowly resumes its shape. Steel springs are unsuitable, because when loaded, they "hit" back at once. He also considered the possibility of obtaining increased shock-absorbing power from shock-absorber rings by employing different rubber mixtures, discussed the use of rubber for conveying petrol, oil, and hot water, and described the rubber-proofing of fabric for balloons. Tests of airplane tires were shown on slides, one wheel having been loaded to 5 tons, which caused the spokes to collapse, but did not affect the tire.

In dealing with other materials, he discussed the development of the waterproof form of "fiber," and remarked that the ordinary form is not isotropic, but has markedly different properties towards humidity in two directions at right angles to each other—a quality to be carefully watched in magneto work.

THE MARKET FOR CHEMICALS AND COMPOUND-INGREDIENTS.

NEW YORK.

Copyright 1917.

WITH the declaration of war came the uncertainty as to what the Government will require in base metals. Pig lead has been in great demand and sellers have adopted a waiting policy. The inactivity in copper is due to buyers holding off for future developments. Spelter continues to be weak and prices have declined. The antimony market has been dull and prices steady.

The shipping difficulties that have beset the foreign and domestic rubber chemical trade for some time have continued during the past month. There has been a good demand, the many inquiries received by the dealers during April showing that buyers are wisely anticipating future requirements.

CHINA CLAY. The steady call, limited supplies and freight difficulties have resulted in advanced prices for this material.

GLUE. All the various grades are in demand and higher prices have been recorded during the month.

HEXAMETHYLENE TETRAMINE. This organic vulcanizing accelerator has advanced 5 cents a pound since our last report.

LEAD PIGMENTS. Red oxide, sublimed blue and white lead, basic carbonate, basic sulphate litharge and orange mineral have all advanced, due to the strong position of pig lead.

LITHOPONE. The market for this material has been firm with small supplies available, and producers are well sold ahead. Spot stocks of both domestic and foreign grades are limited.

TALC. The strong position of both domestic and foreign grades and the steady demand is reflected in advanced prices.

SULPHUR. The strong position of brimstone has resulted in a sharp advance in all grades of sulphur. Flour is now quoted \$2.90 per hundredweight.

VERMILIONS. All grades are in demand and supplies limited. English vermilion is now quoted \$2 a pound.

ZINC OXIDE. There has been a good demand during the month and many inquiries for future positions have been noted. The new schedule for French process grades that went into effect April 1, shows a decline of about 2½ cents a pound in prices quoted last month. There has been no change in the American grades.

NEW YORK QUOTATIONS.

APRIL 26, 1917.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE RUBBER INDUSTRY BEFORE THE CIVIL WAR AND NOW.**

IN entering the European war the United States has reached another great turning point in her national career. The part she is about to take in the struggle for world democracy surpasses even her stand against slavery and secession, far reaching as were the effects of our Civil war. But America is infinitely better prepared to do its bit today industrially, if not at once in a military way, and, happily, that meets the first needs of our allies.

Because of the necessity for rubber in warfare a comparison of the facts then and now, is of the greatest interest.

In 1860 the value of rubber goods manufactured in the United States was \$5,642,700. The capital in-

vested in 27 companies totaled \$3,534,000; the cost of raw material \$3,056,360; the number of factory hands employed was 2,768, and their annual wages amounted to \$794,570. The industry was then centered in the eastern states and 40 per cent of the entire product was made in Connecticut. New Jersey, New York, Massachusetts and Rhode Island ranked next in order.

Factories have since sprung up in half the States of the Union. New England still continues to be the rubber footwear center, but the development of the motor car has built up a still greater center in the Middle West devoted to tires and miscellaneous rubber goods. In 1914, after 54 years, the rubber industry has increased approximately 100 times. The value of manufactured rubber goods for that year was \$300,994,000. The capital invested in 342 establishments totaled \$267,671,000; the cost of raw material \$163,035,000; the number of factory hands employed was 74,022 and their annual wages amounted to \$44,168,000. To this should be added 14,712 salaried officers of corporations and employes who receive \$16,278,000 annually, making a total of 88,734 persons receiving \$60,446,000.

As the population of the United States at the outbreak of the European war had about trebled since 1860 and our exports of manufactured rubber goods had increased approximately ten times, while the total value of our rubber products had multiplied nearly one hundred fold, it is evident that not far from 70 per cent of the increased business has been due to new applications of rubber, notably tires, and more general use of rubber articles of many sorts.

Of course, the figures given represent only the manufacture of rubber goods and do not show its remarkable growth under the stimulus of the war. They do not include the many importers of crude rubber, or of foreign manufactured goods which amounted to \$1,415,362, the scrap dealers and reclaimers, who did a \$12,500,000 business, the fabric, chemical, machinery and other firms entirely dependent upon the rubber industry for an outlet for their product, nor the army of retailers engaged in the distribution and sale of rubber goods. The statement has been made that 1,000,000 persons depend upon the rubber industry for a livelihood, and while the number is startling the infinite ramifications of the industry make it seem plausible.

Statistics show that exports of domestic rubber manufactures for the fiscal year 1916 amounted to \$35,180,096, or nearly three times those of 1914. Crude rubber imports during the fiscal year 1916 were slightly over 70 per cent in quantity and 100 per cent in value greater than in 1914, so that if the value of American rubber products for 1914 was \$300,994,000 it might be conservatively estimated at \$600,000,000 for 1916 with every indication of a substantial increase during the present year.

THE PROPOSED RUBBER WAR TAXES.

IT is difficult to understand why the proposed war tax bill singles out automobile tires and tubes for a 5 per cent levy not imposed upon other rubber manufactures. This means that for war revenue purposes one-third of the rubber product has been classed with liquors, tobacco, amusement tickets and other luxuries. It means further that as crude rubber, like all other imports, will be subject to a flat impost of 10 per cent, tires and tubes must pay double taxes.

The rubber trade as represented by the Legislative Committee of the Rubber Association is advocating a continuance of free rubber and a 5 per cent war tax on all rubber manufactures as being more equitable and raising more revenue than the bill as it now stands. This arrangement, based on 1916 figures, would yield \$30,000,000 as against \$26,517,000, which would result from a 10 per cent duty on the \$164,517,000 crude rubber imports and a 5 per cent tax on the \$200,000,000 tire product.

INDIA RUBBER NOT OBSOLETE.

A RECENT pronunciamento from a committee that is working upon a "Glossary of terms used in the Rubber Industry" will hardly appeal to the scholarly members of the trade. It reads "India-Rubber: An obsolete term for rubber." That the term is not obsolete as far as the best literature of the trade is concerned is not even open to argument.

In "Lectures on India Rubber," edited by David Spence, Ph.D., F.I.C., 1909, occurs the following which is certainly authoritative: The word india rubber, which is still almost exclusively used in English, was first applied, etc.

Furthermore, it can hardly become obsolete because of its value as a term that admits of no confusion or misconception. Leading lexicographers defining india rubber, sometimes giving preference to the word caoutchouc, cite but one substance, the elastic gum that is the basis of the great industry that bears its name.

We append a few definitions of india rubber:

Webster's International Dictionary: A tough elastic substance obtained from the milky juice of various tropical plants.

Standard Dictionary: A soft, flexible and very elastic substance derived from the milky sap of various tropical plants.

Century Dictionary: An elastic gummy substance, the coagulated milky juice of various plants.

Encyclopaedia Britannica: The chief constituent of the milky juice or latex furnished by a number of different trees, shrubs and vines.

Appleton's Encyclopaedia: The inspissated juice or sap of several species of plants of the families *Euphorbiaceae*, *Moraceae*, *Artocarpaceae*, and *Apocynaceae*.

Carl Otto Weber, Ph. D.: The product of the coagulation of the milky juices (emulsion) of a large number of trees, creepers and shrubs, comparable in

this respect to the oils and more particularly the terpenes.

Seligmann, Torrhilon and Falconnet: A hydrocar-bide of vegetable origin extracted from the juice secreted by the protoplasm of so-called primordial cellular tissue of a great number of trees, shrubs and vines, climbers or vine weeds of hot countries.

Journal of the Society of Chemical Industry: The hydrocarbon which occurs in the form of minute globules in the milky juice or latex of many tropical plants.

India Rubber World: A tough elastic substance, the product of coagulation of the milky juice or latex of various tropical trees, shrubs and vines.

These refer and will always refer to one substance only.

On the other hand the word rubber, as defined by the same lexicographers, has the following meanings all in common use:

- (1) One who or that which rubs.
 - (a) An instrument or thing used in rubbing, polishing or cleaning.
 - (b) A coarse file or the rough part of a file.
 - (c) A whetstone: a rubstone.
 - (d) An eraser usually made of caoutchouc.
 - (e) The cushion of an electrical machine.
 - (f) One who performs massage.
 - (g) Something that chafes or annoys.
- (2) The odd game when there is a tie as a rubber of whist.
- (3) Stretching or craning in inquisitive observation, also rubber neck (common slang).
- (4) An overshoe made of india rubber.
- (5) India Rubber: caoutchouc.

Thus, it would seem that india rubber for exact usage is bound to persist. The word rubber with eleven meanings as an equivalent, a secondary term for the sake of brevity, will also continue in use, but as a supplanter, despite its common use, it is not specific nor exact.

Radical changes without good reason are always to be avoided. If, however, the best term is sought, why not call it gum elastic? This was Goodyear's choice and is completely descriptive, and likely to be applied to no other substance.

GERMAN PATENTS AND THE WAR.

IN the event of prolonged hostilities, it is probable that the United States will do much as England has done.

For example, it is perfectly possible that German patents in the United States will be cancelled. This would interest the dye people greatly. It would also interest the chemical concerns and the rubber laboratories, for it would release for manufacture many accelerators on which we now pay royalty to German owners.

A THRILL RUNS THROUGH US WHEN WE READ THAT Hoover as food dictator will serve without compensation. And we should be thrilled at such patriotism. Incidentally we might well utilize a thrill or two in appreciating what men in our own trade are doing without pay. Thomas Robins, H. Stuart Hotchkiss, George B. Hodgman, F. A. Seiberling, A. H. Marks, F. C. Hood, David Spence and others are doing important and exhaustive work for Uncle Sam with no thought of compensation of any sort.

The Rubber Industry Is "Doing Its Bit."

MANUFACTURERS of rubber goods were among the first to place their entire facilities at the disposal of the Government for war preparation. Because of the importance of rubber products in national defense the leading factories in several lines are already turning out large quantities of many materials with which to equip the great armies soon to be raised by selective conscription. Companies so engaged have placed the national welfare above profit or material advantage and are giving first attention to Government requirements at nominal profits. Several companies are now at work on dirigibles for use by the aviation corps.

Quite aside from this wholehearted and important work of equipment, many firms and their employes have engaged in additional patriotic enterprises of many sorts. So varied are these wholesome activities that the disposition of the rubber industry as a whole "to do its bit" becomes evident.

SECURING ADEQUATE RAW MATERIALS.

A notable committee, of which Bernard M. Baruch is chairman, has been chosen to work in cooperation with the Council of National Defense in superintending the production of raw materials for the war at fair prices. Each material will be in charge of a sub-committee, its chairman being a member of the central committee. H. Stuart Hotchkiss, president of the General Rubber Co., and first vice-president of The Rubber Association of America, Inc., is chairman of the rubber committee, which also includes A. H. Marks, Diamond Rubber Co., Akron, Ohio; Frederick C. Hood, Hood Rubber Co., Watertown, Massachusetts.

Further, it is reported that Dr. D. Spence, vice-president and general superintendent of the Norwalk Tire & Rubber Co., Norwalk, Connecticut, has been appointed chairman of the Committee on Rubber of the National Research Council of Washington; this council formed by authority of the President of the United States for safeguarding and developing all scientific knowledge of the country for war purposes.

PROVIDING FOR WAR DEPENDENTS.

Most firms are disposed to provide in some fair manner for the dependent families of enlisted men, and the desirability of some uniform system has resulted in a committee of the Chamber of Commerce of the United States to study the matter and make recommendations. F. A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, Ohio, is chairman.

PENSIONS AND RETIREMENTS.

Several rubber companies have recently adopted a pension plan of retirement as a reward for long, continuous and faithful service. The United States Rubber Co. now takes the lead in announcing that absence for military service will not constitute a break in the continuity of employment on the pension records.

The pension committee, appointed by the Board of Directors May 3, consists of the following: Homer E. Sawyer, chairman, James Newton Gunn, Ernest Hopkinson, H. Stuart Hotchkiss, Theodore Whittelsey, Elisha S. Williams, and Kennedy M. Thompson, secretary.

The Goodyear Tire & Rubber Co. has announced that all employes enlisting for military duty in either arm of the Government service will have their positions kept open for them until their return.

The Dryden Rubber Co., Chicago, Illinois, will pay to any employe who may enlist for active service the difference between the army wage and the average earnings while in the factory.

The United States Rubber Co. has turned over to the Government a portion of its ground floor salesroom at Broadway and

Fifty-eighth street, New York City, for a recruiting office, and its location is a most advantageous one for the purpose.

ENLISTMENTS FOR ACTIVE SERVICE.

Military drill in many establishments has resulted in thousands of patriotic enlistments in the regular army or navy, the National Guard, Reserve, and Home Guard.

Over 160 employes of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, intend to enlist and 30 have already done so. A uniformed Home Guard is also being organized. George E. Hall, vice-president, and J. W. Fellows, factory manager, are members of the Public Safety Committee, and James H. O'Brien, superintendent, has joined the Home Guard.

Several employes of the Bucyrus Rubber Co., Bucyrus, Ohio, will enter some branch of military service. C. P. Mader, secretary, is a captain in the Quartermaster Officers Reserve Corps, and chairman of the military committee of the Bucyrus Chamber of Commerce.

Military drill during working hours has been established for 150 young men in the employ of The Cupples Co., St. Louis, Missouri.

Arthur H. Leavitt, assistant sales manager of the motor truck tire department of The B. F. Goodrich Co., Akron, Ohio, has resigned that office, having been appointed captain in the Quartermaster's Reserve Corps, and has already reported for duty at Fort Sam Houston, Texas.

Drew McKenna, for 15 years with The B. F. Goodrich Co., Akron, and later with Charles E. Wood, rubber broker, New York City, has received his commission as lieutenant of the Officers Reserve Corps, and is now on duty at Plattsburg.

Two sons of H. A. Astlett, the New York rubber importer, are serving in France with the Harjes-Norton section of the American Ambulance Corps. Hugh S. Astlett has been there since January and Eric A. Astlett sailed in April.

E. W. Dunbar, superintendent of the Apsley Rubber Co., Hudson, Massachusetts, is chairman of the local Public Safety Committee. The Apsley factory has been placed at the disposal of the Government.

Classes in military training have been arranged by The Goodyear Tire & Rubber Co., Akron, Ohio, giving all employes an opportunity to drill under the direction of ex-army officers.

P. J. Kennedy and R. T. Riddington, of The Fisk Rubber Co., Des Moines, Iowa, are giving lessons in tire repair to members of the National League for Women's Service. These classes are being well attended.

THE RESERVE OF SKILLED MEN.

In order to insure the services of skilled men in manufacturing material for military use, a nation-wide canvass of the industrial resources of the country has been conducted by the Naval Consulting Board. Thousands of men have enlisted in the Reserve and pledged themselves to work at their respective trades for the Government whenever called upon to do so.

Among those so listed may be mentioned 2,000 employes, 400 shop men and 40 in the testing room, engineering and office forces of the Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin. A. W. Berresford, general manager, is a member of the Naval Consulting Board.

Fully 1,000 employes of The B. F. Goodrich Co., Akron, Ohio, have also joined the Reserve.

MOBILIZATION FACILITIES.

The employes of the Fisk Rubber Co., Chicopee Falls, Massachusetts, have offered their 45-acre athletic field for mobilization purposes, and the company will provide another field for their use elsewhere.

The touring bureau of The B. F. Goodrich Co. has carefully mapped, logged and guide-posted every important road in the United States and this is considered an important factor in case of need of rapid transportation of troops and supplies.

RED CROSS SUPPORT.

With the financial support and cooperation of the officials of the Tyer Rubber Co., Andover, Massachusetts, every department of the factory is now sending a substantial contribution to the Red Cross. Mention is made elsewhere in this number of the enthusiastic meeting at Akron, Ohio, at which Captain E. E. Buckleton told of his experience at the front. It is reported that over 1,500 persons joined this society in Akron within the last two months.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has given to the Medical Corps a fully equipped ambulance, to be kept at the Corps headquarters in Springfield, Massachusetts.

INCREASING FOOD PRODUCTION.

Realizing that the production of an adequate supply of food for America and the nations allied with us in the war against Germany is one of the most serious problems with which we have to deal at the present time, a problem upon the successful solution of which largely depends the result of the war, many firms are heartily responding to President Wilson's appeal. A potato census conducted by a well-known traveling man shows that 90 per cent of the factories in the rubber and allied trades are adding big garden plots for their help.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has ploughed and cultivated 60 acres surrounding the plant and turned it over to employes for vegetable gardens. Each employe will plant and care for his own section and receive the produce or profit therefrom.

The Dupont Rubber Co., Fairfield, Connecticut, is having five acres of land plowed where corn and potatoes are to be cultivated. The crops will be sold to the factory employes at cost.

The Van Cleef Brothers, Chicago, Illinois, are offering vacant land adjacent to the factory to their employes for individual gardens.

The Monatiquot Rubber Works Co., South Braintree, Massachusetts, has plowed and harrowed a portion of its vacant land for allotment to employes for cultivation. Much seed has been distributed free and still more furnished at reduced cost.

The Firestone Tire & Rubber Co. is furnishing plots for its employes to cultivate.

The BeSaw Tire & Rubber Co., Hartville, Ohio, has given the use of 50 building lots to its employes for gardening.

Several hundred acres of ground owned by The Goodyear Tire & Rubber Co., Akron, Ohio, not immediately needed for building purposes, have been placed under intensive cultivation, the principal crops being potatoes, navy beans, wheat, corn, peas, etc. Employes preferring this sort of outdoor work for the growing season will be housed in temporary bunk structures. The company is also encouraging home gardens wherever possible. At the Goodyear Cotton Mills, Goodyear, Connecticut, the company offers to plow all gardens worked by employes, free of charge.

Employes of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, will raise potatoes this spring on 75 garden plots 50 feet square. The company has plowed the land and the shop gardeners are buying their fertilizer and potatoes on a cooperative plan.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, will plant 6 acres to raise garden truck for use in the company's cafeteria.

USEFUL VACATIONS IN AGRICULTURAL DEFENSE SERVICE.

Under the slogan of "Practical Patriotism" the Food Problem Committee of The Merchants' Association of New York is conducting a highly commendable campaign of enlistment for agricultural defense service in which both laborers and employers are being encouraged to cooperate.

To prevent the possibility of famine next year the world is depending upon American farmers to grow the greatest staple food crops in the history of the nation. Farmers have the land, but lack the necessary labor for planting and harvesting. In most factories, however, are many able-bodied men who lived upon farms in their youth and so are experienced in farm work. Employers are being encouraged to release such men for periods of two or four weeks during the crop season with whole or part pay, transportation and a guarantee of their former positions on their return. Not only is this a much needed and patriotic service to the nation, but self-interest of employers and employes alike should make it clear that abundant crops are essential to prevent excessive food prices and consequent abnormal labor costs which will eventually be felt by everybody in the higher cost of commodities of all sorts. Another aspect of the scheme is also worthy of consideration. Such a period of service, though it means laborious work, provides a change of environment, healthful country air and outdoor activity which cannot fail to benefit any factory worker. It is, indeed, a useful vacation, and one which undoubtedly many rubber workers are well qualified to enjoy.

FABRIC WEAVERS IN LINE.

At its annual meeting held at the Copley-Plaza, Boston, Massachusetts, the National Association of Cotton Manufacturers resolved through a special committee to cooperate in all practicable ways with the food board of the Council of National Defense and the Committee of Public Safety of Massachusetts and other states in the work already undertaken or to be undertaken by these bodies, and to impress upon its members the desirability and importance of their encouraging and helping their employes to cultivate garden plots to supply their own needs at least in part.

TRUE THRIFT.

S. W. Straus, president of the American Society for Thrift, points out that misguided thrift, better described as indiscriminate tight-fistedness, is no less a menace at this critical juncture than wastefulness and extravagance. Thrift must be constructive, not destructive, and to stop the wheels of industry through too great deflection from the usual modes of living would be a calamity. Every individual should do his part to keep money in normal circulation, as it furnishes uses for capital and employment for labor. Economic hardships will be minimized if each person is governed by common sense, prudence and foresight, making legitimate expenditures as usual, avoiding extravagance, and particularly eliminating wastefulness in foodstuffs, because on us rests the responsibility of feeding our allies.

Employes of labor should be courageous and confident in the knowledge that the greater share of our participation in the war must be economic and that the billions being raised for war purposes will eventually revert to the pockets of the people, most of our foreign loans also being immediately spent in this country. America continues to enjoy the greatest period of material prosperity it has ever known.

FLOATING THE "LIBERTY LOAN."

THE INDIA RUBBER WORLD is numbered among the leading trade journals of the country, covering nearly every line of business, which are cooperating with the Government by devoting free editorial and advertising publicity to the promotion of projects for the public good, and particularly in floating the "Liberty Loan."

The time has come for all to serve, and every person whose plain duty lies in continuing his ordinary labors can best "do his bit" financially. Every man, woman and child who can do so should buy at least one Government bond. Not only will it be of assistance in furthering the cause of human rights, but it is a good, safe investment as well and paying a fair rate of interest.

Rubber and allied houses are already performing a patriotic service by calling meetings of their employes, explaining the de-

tails of the loan and securing subscriptions. In some cases the firm negotiates the number of bonds required and gives each person the privilege of paying in ten monthly instalments of \$10 each, interest on the necessary money being covered in part by the interest borne by the bond. This encourages savings for the future and stimulates individual thrift.

The Hood Rubber Co., Watertown, Massachusetts, is doing still better, and has taken active leadership in encouraging other similar firms to take up the matter. At the request of Alfred L. Aiken, governor of the Federal Reserve Bank of Boston, Frederic C. Hood is representing the rubber industry on a committee composed of representative New England manufacturers which is promoting the sale of Liberty Loan bonds as a public duty. Mr. Hood has worked out a plan of campaign for his own factory with printed subscription forms, advertising matter descriptive of the bond issue and the desirability of participating, and a plan enabling every employe to invest on easy payments. Under this plan the company negotiates the total number of bonds required and operatives pay \$2 down and \$2 a week for 24 weeks for each \$50 bond, the firm assuming the interest on the necessary money and the investor having the entire interest ac-

cruing on the bond. Financial experts have addressed the Hood operatives on the importance and benefits of investing weekly savings in this manner.

About 275 letters have been sent to rubber and allied firms in the first Federal district of New England, enclosing samples of the printed matter and urging them to adopt the same or a similar plan, organizing the sale under the direction of one man in each factory, who will devote his time to this work until the closing date, June 15. Each firm will, of course, deal directly with the Federal Reserve Bank, the only interest of the Hood Rubber Co. being patriotic cooperation with the government and a desire to tabulate the results accomplished. Many favorable replies are being received and the project promises to be successful.

A list passed around the general offices of The B. F. Goodrich Co., Akron, Ohio, received over 100 signatures of persons obligating themselves to buy Liberty bonds, and since then many employes in all departments have added their names to the list. The Fisk Rubber Co. has notified all employes who wish to purchase these bonds, that it will loan 80 per cent of such subscriptions, allowing payment to be made at 2 per cent per week.

Two Years in England in War Time.

By Arthur E. Friswell.

WHEN war broke out I was living in Bermuda, taking a semi-rest from over 20 years of strenuous work in rubber manufacturing. Only a semi-rest because amongst other light occupations I was the agent for David Moseley & Sons, Limited, of Manchester, England, over whose tire department at their factory in Manchester I had been manager some years previously. The war stopped practically everything in Bermuda except the climate, which, I am informed, still continues almost ideal, and undisturbed. Wishing to re-engage in rubber work after my rest, and thinking that there would be plenty of openings in England, I went there. Theoretically, there should have been any amount of scope. Actually, there was, and is not. Almost every rubber factory came under government control early in the war, the government taking the bulk of the output for military and naval needs. It was useless for manufacturing firms to pay traveling expenses to secure orders which they could not execute, yet most firms have valued representatives whom they do not wish to lose, and they have been given temporary office, staff or departmental positions for the duration of the war; hence a surplus of staff. Many of the actual operatives, the actual producers, enlisted; many rushed into better paid government munition work. Hence a shortage of labor and an altogether anomalous condition of affairs. Firms which had started to build, were compelled to leave foundations and walls as they were, for want of builders and of building materials. Meanwhile, American manufacturers with well-stocked warehouses in Great Britain reaped a temporary harvest, as they were permitted to secure and execute orders denied to the British manufacturer. Government work pays well, and, while it lasts, the British manufacturer has no cause for grumbling; but, it cannot last indefinitely, and British firms soon realized the danger of their home market slipping away from them. Restrictions of importations, particularly of motor-cars and their accessories, quickly hit the foreign competitor. It is safe to say that the war has opened the eyes of British manufacturers to the weaknesses of their one-sided free trade theory more than the previous 20 years or so of tariff reform propaganda, and more than another 20 years of such propaganda by itself would have done.

The Imperial Conference recently held in London between members of the British Cabinet and British Colonial Premiers

is hailed as welding the hitherto loose links of Empire, yet only a few years prior to the war, when such a conference was suggested, Winston Churchill, speaking for the government as a responsible cabinet minister, said that "The door was locked, bolted and barred" against what was regarded by the government as a purely fantastic suggestion. So has the sledge-hammer fact of war changed opinions and theories. When the Chamber of Commerce of Manchester, the very home of free trade, passed a resolution by an overwhelming majority throwing free trade overboard, that policy of buy cheap, regardless of real cost, went into the limbo of things lost.

This is not an academic discussion. It directly affects American manufacturers who desire to secure or retain a share in the markets of Great Britain, and I am firmly convinced that they can do so hereafter only by actually manufacturing in Great Britain. This I think they can do successfully. With their alert methods, their greater willingness to change and improve processes, their more generous conception of wage paying and their more elastic idea of interchange of ideas than the very good, but very conservative Britisher holds, Great Britain should be a very profitable field for the American manufacturer, and the British manufacturer would not resent such competition waged on his own ground, employing British labor and paying British taxes fairly and squarely with himself. All this is, of course, for the war after the war.

For some months I represented an English rubber firm in their Sheffield branch, and a few months ago cutlery manufacturers there were almost begging for what they term razor scales, which are the coverings for razor handles and for knife and fork handles, these coverings being made of ebonite, or hard rubber. The supply was then extremely limited, the demand practically unlimited. Materials previously used for the purpose—bone, ivory, fiber, etc.—were almost unobtainable. I cannot say to what extent the recent restrictions of cargoes might affect the export from this country, but I know that such ebonite articles were (and probably still are) urgently wanted. Some of the largest makers of cutlery were eager to place contracts for three years to cope with government orders alone.

Pending consultations with some of the leading rubber firms in Great Britain, I engaged in war work in various parts of the country, and came into direct contact with the quiet, but very

determined war spirit and its actual productive activities. The deadly, thorough earnestness, the utter carelessness of cost, is remarkable. The output is staggering, literally prodigious. Great Britain is one vast arsenal. Scarcely a village, town or city possessing a workshop or any half-way suitable machinery is not working day and night to feed the insatiable mouth of war. And all, under a deceptively superficially calm exterior. The British have tackled the job as though it were to last forever, and that is their temperament. The ingenuity and efficiency of American machinery is everywhere in striking evidence. For years prior to the war, there was conflict between capital and labor. The one paying as little, the other doing as little as possible. The war has given labor the upper hand. It is decidedly the "top dog." As Minister of Munitions, Lloyd George gave to the trades unions practically all they demanded, including rates for work which may be increased, but cannot be reduced, and members of trades unions are reveling in such prosperity as they never expected. In many directions wages paid now are as much in excess of actual value received as prior to the war they were inadequate.

Female labor has come into its own at a bound, women are doing men's work and doing it well in every imaginable direction, in workshops, on the farms, as postmen, railway workers, van drivers, window cleaners, clerks—at almost everything, in fact. I am not sufficiently conversant with industrial and political economy to forecast the results after the war, but anyone with half an eye can see that the suffragettes have won by sheer merit, and that woman will never again be relegated to the cramped industrial conditions of pre-war times.

When Tommy exchanges his rifle and bayonet for the tools of his proper trade, there will be trouble to tax statesmanship before a *modus vivendi* is found, and the hide-bound conservatism of British capital and the "ca-canny" silliness of British labor will both have to yield to some sort of mutual understanding more nearly approaching national common sense.

I have seen Zeppelins plying their devilish trade and the after-results, which were reported quite truthfully, officially, as of "no military importance," but the damage, aside from military importance, was very real. I saw one brought down in two parts in flames. It was a good display of fire works and produced just about the same effect on the very unemotional crowd which witnessed it. I do not think any more of them will visit the British Isles. Their visits and their reception are rather too costly. The English are an extremely patient, dogged people, and after two years with them one is compelled to feel that they possess the quality to win. They feel very grateful to the United States, and I do not think they could have sent to the people and to the government of this country a finer exponent of themselves than Mr. Balfour. I have had the pleasure of meeting him while I was working in Northeast Manchester, for which constituency he was then member of Parliament. A ripe scholar, a preeminent statesman, a sincere polished gentleman.

My return crossing on the "St. Paul" was without incident, except that there were aboard the survivors of officers and crews of four American vessels that had been either torpedoed or shelled in South American waters, in the Mediterranean and off the coast of Scotland. Their experiences had not perceptibly affected their spirits, although some had spent 30 hours in open boats. They are going to sea again as usual. Some of them perhaps once too often. Neither they nor the British sailors I have met attempt to minimize the U-boat, but all feel that invention will beat invention and very soon, and there are rather more than official hints to that effect.

SPECIAL TIRES FOR MILITARY TRANSPORT.

In a recent contribution to a German motor paper, an authority on motor vehicles expresses his admiration of the transport organizations which contributed so much towards the success of

the Allies in the Caucasus. After discussing the general construction of the cars used, he describes the special tires. These were band tires with cylindrical air chambers and were of special breadth and thickness, which, besides permitting quick running, prevented skidding in case of punctures. The tires also had the added advantage, that they could stand overloading of the trucks.

CAPTAIN BUCKLETON TALKS.

CAPTAIN ERNEST E. BUCKLETON, known to the rubber trade of two continents, at the urgent solicitation of the Red Cross has been induced to talk of his experiences at the front.

CAPTAIN ERNEST E. BUCKLETON, continent seemed to be showering on top of me.

At a great and enthusiastic meeting in Akron he said in part:

It was one of those "quiet days on the western front" you read so much about in the dispatches. Outside of a continuous cannonading, and uninterrupted rifle firing, interspersed with a few trench bombs and minor trifles of that sort, it was a beautifully peaceful end of a perfect day. Then something happened—it wasn't until some time after that I discovered just what it was that did happen. I do know that the universe seemed to be filled with an overwhelming, crushing sound. Chaos describes it as nearly as any mortal word.

I felt myself soaring aloft amid a volcano of rocks and dirt and things that had once been men. Then I came down and a

I suppose they must have dug me out. The next I knew I was in a hospital bed with one of those angels of mercy caring for me. There were deep dark rings about her eyes—I afterward found that she had hardly sat down in 48 hours—but there was a smile on her lips and a cheery, bucking word for me. And I must have been a pretty horrible looking specimen, too, what with my heart and stomach all distended out of human shape, and my face that rotten green from the poisoned gas fumes.

Bless those Red Cross nurses, with their brave hearts and their souls too big for their bodies! In all the time I was in the hospital I never heard a murmur of complaint. They were always ready with a smile, a little joke, a cheery greeting, or some tender ministrations; and this in spite of the fact that they were working, many of them, 24 hours a day, amid scenes of horror that beggar description—laboring over men so frightfully mutilated that seasoned army surgeons turned sick.

Your American Red Cross nurses and workers have done wonders. Without them we would have had a tough bit of a time getting along. Your American hospital in Paris is the most efficient of all the war hospitals and your surgeons are marvels. Not the least of the American Red Cross work has been done in the prison camps of the various countries. They have seen to it that the prisoners got better food and better housing, and they have practically eliminated those scourges of prison camps typhus, typhoid, scurvy and cholera. Every soldier is looking forward eagerly to the time when tens of thousands more of your plucky American women will be wearing the familiar habit.

Boost for the Red Cross! Wouldn't you?

Captain Buckleton was enthusiastic over the sending to France of nine regiments of American railroad engineers. He declared:

They will be of inestimable service. No one realizes how badly we need more railroads to transport materials and food to the front. It will be a fine thing for your new army, too, for these men will have an opportunity to get hardened to the nerve-racking task of working under fire, and so be able to help train new contingents as they arrive.

The moral effect of the Stars and Stripes can't be overestimated. I would like to be present if they decide to send a part of the contingent through Paris. Talk about an ovation!

COPY OF INDEX TO "Rubber Machinery" will be sent free upon request.

Italian Aircraft in the War.

AIRCRAFT activities in warfare are now numerous and varied. Airplanes examine the battlefields minutely to discover the enemy's defenses and traps, which are recorded and mapped photographically. By means of these records and in conjunction with kite and captive balloons, artillery fire is directed and infantry columns led to victory, while both airplanes and dirigibles, like cavalry raiding parties in open warfare, often travel far over enemy territory and find targets for bombs along communication lines and in supply depots.

Balloons of every sort have been of inestimable value in the unique mountain warfare being waged by Italy, while airplanes are employed in great numbers as on every European battle front. Several different types of airplanes are in use, each to perform its special task. There are Farman and Voisin machines for reconnoissance, Caproni machines for bombardment, Farman and Caudron types for artillery squadrons, and light, active Nieuport machines for fighting and pursuing hostile aircraft, while hydroplanes are used at sea.

The well-known firm of Pirelli & Co., Milan, Italy, enjoys a practical monopoly of all rubber manufactures for the Italian Government, has turned out large numbers of captive balloons for the army, and also supplied considerable quantities of balloon and airplane fabrics to the allied countries. In this great establishment, one of the largest in Europe and employing several thousand persons, the directors of the business are known for their progressive tendencies in experimenting with new rubbers, machinery and processes. There is probably no article of rubber, gutta percha, asbestos or balata which is not made to-day by Pirelli & Co. Tires, footwear, soles, waterproof fabrics, surgical, sporting and hard rubber goods are all important lines, and this firm was the first in Europe to compete with England in rubber thread and the making and laying of submarine cables.

Thousands of miles of cables have been laid for the Italian and Spanish Governments and the maintenance of many laid by England has been assumed. Power cables over the Andes in South America, and for distributing the enormous power at Niagara Falls, are considered among their most spectacular achievements. To facilitate this work large branch factories are in operation at Spezia, Italy, Southampton, England, and near Barcelona, Spain. All of this experience fitted them notably to assist their government when war was declared.

At present the firm's output is chiefly of a military character and the family which owns and directs it is placing its services unreservedly at the command of the nation. While Dr. Alberto Pirelli is under government orders in charge of Italian army construction work in his factory, several departments of which have been militarized, his three brothers have all joined the colors. Piero Pirelli, also a managing partner of the firm, is attached to the staff of the commander-in-chief, another brother is in a cavalry regiment and the third has joined the aviation corps.

Cooperation and coordination in war manufacture are now in order as never before, and as Italy has become an ally of the United States equally with England, France and Russia, it is likely that the big rubber companies of America might obtain practical information from Pirelli & Co. that would be of great service in the manufacture of balloons, "blimps" and other dirigibles of larger size. Dr. Pirelli visited the United States for several weeks in 1908, when he met many of our leading rubber men.

It will be remembered that George A. Pirelli, one of the firm, spent several months in the United States about a year ago and called on the various supply and machinery houses and also visited the principal rubber mills of the United States and Canada, returning to Italy late in the fall.

ITALIAN CAPTIVE BALLOON ASCENDING

before, and as Italy has become an ally of the United States equally with England, France and Russia, it is likely that the big rubber companies of America might obtain practical information from Pirelli & Co. that would be of great service in the manufacture of balloons, "blimps" and other dirigibles of larger

WORKING FORCE OF PIRELLI & CO., MILAN

Trapping Dollars.

COAL costs money. Its value is based on the big round American dollar. The ordinary manufacturer runs much steam into the open air and it is wasted. Every unit of heat which can be returned to the boiler after the steam has done its duty is just so much money saved.

Steam traps collect and discharge the hot water of condensation from any system where steam is used, without allowing steam to escape, and are cheap and efficient money savers.

Where the hot water of condensation is free from grease or any other impurities, it is generally returned to the boiler either directly or indirectly, depending upon the system, thus saving the contained heat. This amounts to the equivalent of approximately five to ten per cent of the coal burned.

In rubber mill work there is exceptional opportunity for reclaiming the hot water of condensation, where so much steam is used for manufacturing purposes, such as in heaters, vulcanizers, presses, in heating buildings in the winter season, etc.

When a vulcanizer, for example, is located at a distance from the boiler more or less trouble will be experienced from condensation which comes over with the steam. If this heat-reducing water is promptly removed by an efficient steam trap there will be no delay in heating up and the desired pressure will be maintained with certainty. Thus time is saved and the danger of flooding the heater eliminated. Many tires have been under-cured due to an inefficient steam trap and the consequent submersion of the molds in the heater by water of condensation.

This difficulty may be overcome by the use of a reliable steam trap piped to the main steam supply line at a point where the accumulated water will flow to the trap by gravity and the trap will, with the aid of steam pressure, force the water of condensation out of the trap into a receiver or back into the boiler, thus saving the hot water which otherwise would be allowed to go to waste.

A very common trouble with steam traps is caused by low places or pockets in the piping system. Water accumulates in the low spots and is forced through into the trap at intervals, causing an uneven discharge. Where the quantity of accumulated water is sufficient and the steam valve in the line is opened suddenly this water is forced through the pipes at such a high velocity as to cause a water hammer which is very destructive to the whole piping system.

The principal traps in use are siphon traps, float traps, bucket traps and expansion traps. These in turn are sub-divided into special traps, such as return traps, vacuum traps and others designed for special purposes.

SIPHON TRAPS.

Siphon traps, the simplest, are constructed according to the well-known siphon loop principle, consisting of two lengths of

pipe with a return bend. These are used for low-pressure work and more for controlling pressures within the system than for discharging under atmospheric pressure. When the pressure does not rise above 2 or 3 pounds, a trap is used which acts on the siphon principle, but is constructed on different lines that permit sinking it in the ground.

It is considered good rubber mill practice to use separate traps on each unit, particularly the larger machines; however, a line of presses operating at the same steam pressure may be satisfactorily served by a trap on the main steam supply line. Any well-made trap of proven capacity of either the float or bucket type may be used in connection with high-pressure steam. The

former depends on a float for operating the discharge valve, while in the latter the buoyancy of a floating bucket is overcome by the inflowing water which opens the valve within the bucket when-

FIG. 2. STRONG TRAP.

ever it is discharged. The following are typical bucket traps.

BUCKET TRAPS.

In conjunction with vulcanizing presses for mold work, the bucket-type steam trap is generally recommended. If the steam pressure is the same for each press, it will be possible to operate several presses on one trap of suitable size, but five presses operating at 80 pounds and five at 60 pounds, for instance, would require a separate trap for each group. Sometimes the trap valve is opened or closed to increase or decrease the circulation speed, and in this instance an individual trap is preferable.

In Fig. 1 is shown a sectional view of the well-known Squires bucket steam trap. It has one inlet, two outlets and two blow-off connections. The pipe connections can be made on either side, whichever may be most convenient, leaving the other side plugged. After installing the trap there should be enough water in it to float the bucket, as the valve does not seat until the bucket is up. As soon as sufficient water enters the trap, the bucket, being buoyant, rises and closes the valve, which is attached to it by the valve stem. When condensation in the trap body has reached the high-water line the bucket fills and sinks, opening the valve which discharges the water in the bucket, leaving enough to insure a perfect water seal, together with the condensation in the trap body through the valve port to the outlet until it has reached the low-water line.

Another bucket trap, known as the Strong trap, is shown in Fig. 2 and, briefly, consists of an open bucket hinged at one side. When it becomes partly filled by the water overflow from the trap, it tilts to the right, opening the valve located at the top, and the water is discharged

FIG. 1. SQUIRES BUCKET TRAP.

FIG. 3. STICKLES TRAP.

from the bucket into a tank from which it is pumped back to the boiler. This trap will discharge the water twice as many feet higher than the trap as there are pounds of steam pressure at the trap.

FIG. 4. ANDERSON TRAP.

In the Stickles bucket trap, shown in Fig. 3, the water enters the inlet *A* through the chamber *B*, which contains four ports *C* leading into the trap proper. As the four ports are at the top of the chamber even with the top of the bucket, it is possible to maintain the water surrounding it at the full height of the bucket. The discharge of water into

the trap when it is in operation, or open, is across the top of the bucket line. This action prevents water that floats in the bucket from being blown out.

Water and steam upon entering the trap come in contact with a baffle or separating ring *D* which throws the water downward and the steam upward, the steam entering the upper port *F*. Thus the steam and water are separated as they enter the trap while the discharge is taking place and water is discharged instead of steam and water.

The water passes out through the large pipe *G* in the direction of the arrows, but sufficient water is left in the bucket when the valve closes to form a water seal, and steam will not blow out at the end of the discharge. The force of the water on the wings of the valve when it is discharging assists in closing the valve quickly.

The valve rod, made with a flexible joint, connects the valve with the bucket, the flexible joint allowing the valve to seat squarely. When large volumes of water are to be handled the trap is fitted with double-ported valves.

FIG. 5. WATSON & MCDANIEL TRAP

FLOAT TRAPS.

Vacuum chamber dryers, vacuum rotary dryers and fabric dryers used by rubber manufacturers and reclaimers for drying rubber and fabrics are generally equipped with float traps. It is necessary to have an individual trap on the steam line from each separate dryer; otherwise there will be back-pressure and the condensation will not drain properly; moreover, a float trap which has a greater capacity than is actually needed in order to take care of any variation, is usually specified.

The Anderson trap shown in Fig. 4 is a typical float trap, and its operation, briefly described, is as follows:

The condensed water enters the trap at the point marked "Inlet" and when sufficient has accumulated to seal the valve with at least three or more inches of water, the float then rises and opens the valve, allowing the condensed water to escape at just the right rate to take care of the amount entering the trap, thus maintaining a water seal at all times.

The trap may be connected to several dryers with good results, provided a uniform steam pressure is maintained at all times. It is always advisable when making up a connection of this kind to run the several drips into a large header and attach

the trap to the header, which has the effect of equalizing the pressure to a certain degree and produces better results.

When the pressure varies to any extent in the dryers the one having the highest pressure will discharge freely and back up into those having a lower pressure, and the best results can be obtained only by attaching separate traps to those having lower pressure.

After the trap has been in use a short time it is advisable, especially on new piping, to unscrew the sediment strainer and

remove the accumulation of scale and chips.

In the sectional view of the Watson & McDaniel trap, shown in Fig. 5, the water is discharged as fast as it reaches the trap. It has a large valve

FIG. 6. DAVIS TRAP.

outlet at the bottom, the valve of which is operated by a copper float.

The water of condensation enters the trap through the inlet *A*. The valve disk seats against *B* on the under side, and against the pressure in the trap, and being away from the bottom of the trap does not choke up with sediment. The valve stem *C* is operated by the float *D*, and as the water rises in the trap body the float lifts, moving the valve disk away from its seat, when the steam pressure on the water will force the water out of the trap body through the valve seat *B* and out of the discharge outlet *E*. As the valve is practically balanced the weight of the float is sufficient to overcome the pressure on the valve.

Another trap that operates on the same principle as the foregoing, and is illustrated in Fig. 6, is the Davis trap.

It is, however, equipped with double cone-shaped balanced valves, which are operated by a copper float. The valves are always sealed by water which prevents leakage of steam when the trap is discharging. As the valves are balanced the trap operates equally well under high, medium or low pressure without adjustment. As there are two valves, the trap is of twice the capacity of a single valve trap having the same valve area of one valve. The valves are cone-shaped and do not readily stick.

The water of condensation enters the inlet *A*, and as the water increases in height in the body of the trap the float lifts, carrying the lever *B* with it, which in turn moves the rocker arm *C* and forces the valve *D* down and the valve *E* up from the seat.

FIG. 7. DETROIT TRAP.

The water is then discharged past the valves and out through an outlet at the side of the trap, not shown.

The Detroit separating trap illustrated in Fig. 7 differs from the others in that the working parts are all on the outside and therefore easy of access and observation. It is not dependent upon the buoyancy of some hollow float, or the contracting or expanding of certain parts, but simply upon the weight of the water in the tank acting against the counter balance weight, to open and close the outlet valve. There is absolutely nothing inside the tank. These traps have large capacities and are quick to act.

EXPANSION TRAPS.

The Sarco, shown in Fig. 8, is a good example of this type of trap and is recommended for its extreme simplicity, being operated by an expansible fluid that controls the valves.

It consists of a steam pipe body which can be screwed on anywhere in a steam main or pipe, occupying very little space and taking the place of an elbow or bend. In this body a Sarco

FIG. 8. SARCO EXPANSION TRAP.

cartridge is inserted, containing an easily expansible fluid operating a corrugated, hermetically sealed, tombac tube, to the lower end of which is attached a piston, which carries the valve head.

The trap is placed in position and the cartridge unscrewed a few turns. When the steam has heated up the cartridge, expanding the fluid and forcing out the piston, the cartridge is to be gently screwed forward until the valve head meets the seat, closing off the steam. The adjustment can then be locked and the trap works automatically. As soon as water collects, the liquid contracts and the valve opens. The condensation is then ejected by the pressure behind it, and immediately the steam comes into contact with the cartridge, there is an expansion and the trap closes.

All of the above traps are separating traps, designed primarily for draining high or low pressure steam mains, vulcanizers, receivers, and steam separators. Their office is to hold the steam in check and at the same time return condensation to the feed water heater or hot well, but not to the boiler.

RETURN TRAPS.

Direct return systems are used to automatically return the condensation directly to the boiler without loss of heat, also to remove the air. The Detroit systems comprise the single system when high pressures are dealt with, the double system for low pressures, and the combination system when exhaust steam is used for heating in the day time and live steam at night. These systems require different installations, and tilting traps with outside working parts are designed to meet special requirements of the engineering problems.

The following brief description of the Detroit return trap will explain the operating principle of this device.

Referring to the illustration in Fig. 9, the water enters the right hand bearing through the inlet check valve, passing up into the tank through the hollow trunnion and discharging, then leaving by the same path, only through the outlet check valve. The tank becoming two-thirds filled, its weight offsets

the counterweight, and on account of the tank being supported off center, it has a downward action on the tilt end. This tilting action is for the purpose of opening and closing the steam and air valves in the right hand bearing. When the trap is filling, the steam valve is closed, but when discharging it is opened to allow a pressure in the tank to force the water out. The air valve is opened when the tank is filling and closed while discharging. Both the steam and the air pass through the upright pipe inside the tank by way of the right hand half of the hollow trunnion.

FIG. 9. DETROIT RETURN TRAP.

A return trap of different design, illustrated in Fig. 10, is the Pratt & Cady trap. It consists of a body containing a float *A* which actuates a lever *B* which in turn operates the rocker arm *C*. On the outer end of the lever *B* is a weight *D* which counterpoises half of the weight of the float. The rocking lever *C* has a weight *E* which rolls to each end alternately as the feeder fills and is emptied of water. The rolling ball acts at exactly the same point every time to open and close the steam valve *F*. The rod *G* connects the lever of the valve *F* with the rocking lever *C*.

In operation, water enters the inlet pipe and lifts the float *A*, which causes the lever *B* to move downward at the outer end. This movement is imparted to the rocker arm *C* by the pin and catch block. When the movement of the rocker arm *C* is sufficient, the ball *E* will roll to the opposite end from the position shown, which suddenly tilts the arm *C*, giving the lever *G* a pull which opens the steam valve *F*. This admits steam at boiler pressure into the trap and the water is forced out through the discharge pipe.

When the water is lowered sufficiently in the trap the float causes the outlet of the lever *B* to rise until its motion has caused the rocker *C* to tilt in the opposite direction, when the ball will return to the position shown, closing the steam valve with the same sudden motion with which it was opened.

The Bundy tilting trap is designed to handle water of condensation at high temperature from coils or other sources when it collects and returns it to the boiler.

The trap is designed as shown in Fig. 11. The yoke is made with an extension on the upper side, so that the yoke approaches a ring in shape, as shown in the semi-sectional view, Fig. 12. The upper section of the yoke is connected to a discharge valve operated by the tilting of the bowl in unison with the lower or steam valve. The latter has a vent, as shown in Fig. 11. Referring to Fig. 12, water enters the trunnion *A* in the direction of the long arrow. Live steam is admitted to the bowl through the valve *C* and the left passage of the hollow trunnion.

FIG. 10. PRATT & CADY TRAP.

The discharge water passes from the right trunnion in the direction of the short arrows to the discharge valve *B*; the same trunnion is used for the inlet and discharge water. In operation the water to be handled is returned to a receiver and flows by gravity to the bowl of the trap through a check valve. When the bowl is full of water it tilts to its lowest position, which action opens the steam and discharge valves. Live steam, therefore, rushes into the bowl and the water, being under steam pressure, is forced out through the inlet passage, but, being prevented from returning to the receiver by the check valve, passes through the upper part of the yoke, the discharge valve and the discharge pipe.

As soon as the water has been discharged from the bowl the weight brings it back to the filling position, which action closes the steam and discharge valves, when the cycle of filling and discharging is repeated.

The Morehead design of tilting return traps is shown in Fig. 13. This trap receives water of condensation and automatically delivers it to the boiler at practically the temperature due to the pressure at which the steam is condensed. The steam pressure is admitted to the surface of the water in the trap and is automatically shut off before the trap tank is empty. The steam used is only such as is condensed by the latent heat passing from it to the water in the tank and all is returned to the boiler.

Referring to Fig. 13, the water enters the trap through the inlet pipe in the direction of the arrows pointed toward the center through the water end of the trunnion *A*. The opposite trunnion holds the steam admission valve which regulates the steam supply. The tank is counterbalanced by a cast-iron counterpoise weight on the end of a wrought-iron lever. At the point of application of this valve lever to the tank, an extension rod engages with a lever controlling the steam valve.

Just under the ends of the tank are two upright buffers which limit the swing of and provide resting points for the trap in its filling and discharge position, thus removing all weight from the trunnion packing.

The trap tank is maintained in a horizontal position by the weight lever, and when sufficient water has entered the trap to overcome the action of the lever, the tank will tilt downward, automatically opening the live-steam valve, admitting steam at

FIG. 11. BUNDY TILTING TRAP.

FIG. 12. ARRANGEMENT OF TRUNNIONS AND VALVES. BUNDY TRAP.

boiler pressure above the water. The pressure in the tank then forces the water out of the rear connection through the water trunnion and discharge pipe to the boiler. When the tank is relieved of water the weight tilts it back to its original position, and the filling and tilting action is repeated.

VACUUM TRAPS.

Vacuum traps are used for drying vacuum lines or any ap-

paratus working under a vacuum. The Detroit vacuum trap, shown in Fig. 14, is always placed at the low point of the heating system and receives the condensation by its vacuum, lifting it to the return trap on top of the boiler. In operation, when the vacuum trap fills it tilts downward, the live steam valve is opened, which allows a pressure on the trap above the water. This pressure forces the condensation up to the return trap on top of the boiler. This upper trap receiving the water, fills and tilts forward, opening the live steam valve. Thus the trap pressure being equal to the boiler pressure, the water by the law of gravity flows into the boiler, due to its position several feet above the water line. When the traps have emptied they automatically return to a filling position, closing the live steam valve and opening the air vent valve on the upper trap and the cold water valve on the vacuum trap.

Another vacuum trap, known as Winter's, is illustrated in Fig. 15. One end of the trap body is fitted with a removable head and secured by bolts, as shown. Connected to the top of the trap is a swing check-valve *C*, opening toward the trap. A discharge pipe carrying an outlet check-valve *D*, which swings away from the trap, is connected to the bottom. In the chamber below the pipe *N* is a bronze bushing *L*, containing a piston valve *A*. Internal ports are so placed in the valve chamber that they communicate with two sets of radial ports *B* and *G*, in the bushing, the port *M* being in communication with the pipes *N* and *O*.

The pipe *N* connects with the pipe to be drained, and *O* with the atmosphere.

The piston valve is attached to one end of a valve-stem, the movement of the valve being limited in one direction by the head of the bushing, and in

FIG. 14. DETROIT VACUUM TRAP.

the other direction by a socket nut screwed on the valve-stem and working in a socket, as shown, at the right of the adjustable disk *F*; the valve stem also carries the adjustable disk *J*.

There are two inward projecting brackets, *P* and *Q*, the first supporting a shaft *R*, upon which is loosely mounted a rocker with which is connected one end of the link *S*, the other end being connected, by means of a pin at *T*, on the lever carrying the ball-float *K*, which imparts a rocking movement to the lever when the water level in the trap varies. On the shaft *R* a hammer or lever of unstable equilibrium is mounted, the upper end of the hammer having two arms which straddle the valve-stem. The rocker is provided with two toes *E* and *H*, which engage the hammer, thus giving the necessary valve movement.

FIG. 13. MOREHEAD TILTING TRAP.

The operation of the trap is as follows: With the parts in the position shown, which will be the case when the trap contains the maximum volume of water to be discharged, the action of the float will shift the valve *A* to the position shown; the port *B* communicating to the air or steam pipe is open and the air rushes in and destroys the vacuum in the trap and holds the inlet valve *C* to its seat, while the outlet valve *D* opens by gravity and permits the accumulated water to escape. When the float begins to lower, due to the falling water level, the toe *E* of the rocker will move to the right and, by contact with the yoke of the hammer, will shift it in the same direction. When the hammer passes the dead center it falls to the right and strikes the disk *F* with sufficient force to move the shaft and valve stem to the

right, thus closing the port *G* and opening the port *H*. This operation once more est-

ablishes and maintains a vacuum until the water of condensation reaches such a level as to cause the toe to move to the left and again shift the hammer, causing it to fall to its first position. Contact with the disk shifts the valve stem and valve, closing the port *G* and opening the port *B*.

when the vacuum is again destroyed and the trap again emptied of water.

No live steam is required to operate the trap, unless the discharge is to be elevated above the trap. There are no stuffing-boxes nor trunnions and but one valve.

As a final word it is necessary to call attention to the importance of proper pipe connections in the installation of steam traps. No matter how well made or designed they may be, successful operation depends on the two general principles, equalization of pressure and gravity flow being carefully considered in making steam trap installations.

JUDICIAL DECISIONS.

GUARANTEE TIRE & RUBBER CO. v. VEHICLE APRON & HOOD CO. This was an appeal from the Superior Court of Marion County, which judged for the plaintiff.

Defendant objected to the instructions of the court to the jury concerning the question of the authority of plaintiff's agent to make an agreement for the return of goods, claiming that these instructions did not tell the jury that plaintiff should have accepted or repudiated the contract as a whole.

It was found that the case had been given a fair trial on proper instructions and judgment of the trial court was affirmed. [Northeastern Reporter, Vol. 115, page 89.]

MARKS RECLAIMING PATENT DECISION.

In our issue of April 1 we stated that the Circuit Court of Appeals for the sixth circuit, by affirming the decision of the District Court, had created a situation which left the question of the validity and infringement of the Marks Reclaiming Patent still undetermined. An examination of the decision shows that that is not the case, as the Circuit Court of Appeals in Ohio based its decision solely on the question of infringement. The following is quoted from the opinion: "In the view we take of the claim allowed and the question of infringement, it is not necessary to pass on the validity of the patent."

As to infringement, the Ohio Court had before it a different question from that before the New York Court. In Ohio, the

defendant was first destroying the fabric in the rubber with acid and then treating the rubber for about seven hours with caustic soda. The Court held that this process did not infringe the Marks claim for a treatment of "twenty hours more or less" with caustic soda. The Ohio decision in no way affects the earlier decision of the Court sitting in New York.

UNITED STATES CUSTOMS DECISION.

The United States Court of Customs Appeals, May 14, rendered the following decision relating to syringes and other articles in chief value of hard rubber, in the case of Knauth, Nachod & Kuhne v. United States. These goods were assessed at 25 per cent as manufactures of hard rubber. The importers protested that they were properly dutiable at 15 per cent as druggists' sundries, but the Board of General Appraisers overruled the protest and their decision was affirmed by the Court.

"HORSESHOE," ADMITTED TO REGISTRY.

In THE INDIA RUBBER WORLD, April 1, 1917, a brief reference was made to the trade-mark "Horseshoe." In order to prevent any misunderstanding, the complete decision follows:

Ex parte, Racine Auto Tire Co. Application for registration of trade-mark for tires, outer casings and inner tubes, filed March 31, 1915, No. 85,589. Appeal.

The applicant appeals from the ruling of the examiner of trade-marks in refusing registry of the word "HORSESHOE" as a mark for inner tubes for tires, and tires and tire casings of rubber or rubber and fabric, on the ground that the term is merely descriptive of the goods.

If it be supposed that the word is merely descriptive of the outer tires because the tread of the tires may have projections in the form of minute horseshoe figures (of which I find no evidence in the file), I think nevertheless this is not merely descriptive, since no mechanical function or peculiarity of construction in a mechanical sense arises out of the raised studs being U-shape rather than T-shape or O-shape. Any projection having parts running in variant direction would be functionally the same; the particular shape is a mere matter of suggestive appearance. Would a 4-11-44 mark be descriptive because repeated over and over around the tread?

The case is distinguishable from that in *re* United States Tire Co. 225 O. G., 1107, because a chain tire is a tire having a chain-like series of projections, that is, projections with elements both longitudinal and lateral, by which the mechanical function of preventing slipping in either direction is attained. The chain tire was in wide use and patented as such, and the word described a useful unclaimed construction which anybody had the right to describe by that term. But if one thereafter should put a chain of figures of a duck on the tire and call it the "Duck" tire, this would not describe the tire, but the particular design of the projections thereon, used in that form, not for mechanical purposes, but for ornament and identification.

A more serious question raised is whether the applicant is barred by the fact that the expired Ives patent, No. 541,091 of June 18, 1895, shows incidentally a series of projections in the form of horseshoes on the tire in one of the figures. I do not, however, feel justified in assuming, because Ives published a picture which showed conventionally some projections of diamonds, horseshoes, etc., that therefore if one made a tire accordingly it would of course be described as a diamond tire or a horseshoe tire.

Certainly, as to inner tubes, on which of course the applicant would never put horseshoe projections, the trade-mark cannot be refused registry. The horseshoe has a prominent significance as the sign of good luck; it is fanciful, and a good identifying mark. It appears of record that no other tires known by this name have ever been made or known, though the applicant inquired of Ives and the owner of his patent. The mark will therefore be passed for registry, and the examiner's rejection is overruled.

F. W. H. CLAY,

Assistant Commissioner
United States Patent Office.

October 30, 1916.

Orders for submarine batteries have been placed by the government of the United States with several rubber mills. This is said to be seriously affecting the supply for battery dealers. These batteries are very large, and battery equipments for submarines are said to cost \$50,000 apiece.

What the Rubber Chemists Are Doing.

NATURAL COAGULATION OF THE LATEX OF *HEVEA BRASILIENSIS*.

THE phenomena of natural coagulation of the latex of *Hevea Brasiliensis* is under investigation by L. E. Campbell, who presents a preliminary account of his research in the "Journal of the Society of Chemical Industry" (March 15, 1917), condensed as follows:

Reference is made to the hypothesis of Whitby that four agencies are responsible for the changes that take place in the latex of cultivated *Hevea Brasiliensis*, namely a coagulating enzyme, an oxidase, anaerobic putrefaction, and aerobic putrefaction. The present paper concerns only the coagulating enzyme, the nature of which has been determined to some extent. The natural coagulation of latex bears a superficial resemblance to the clotting of blood. It is known that blood contains a coagulating enzyme and that lime salts (calcium chloride) exert a particularly favorable influence on the rapidity with which the clotting of blood takes place. On the other hand, if blood be collected in a solution of alkali oxalate it does not clot, owing to the precipitation of the calcium oxalate. Again, the presence of calcium salts plays some part in the coagulation of milk by rennin.

Coagulating enzymes are known to occur in certain plants, and some of these are known to require the presence of calcium salts for their action.

Two sets of experiments were carried out, one on the influence of the addition of calcium chloride and the other on the influence of the addition of precipitants of calcium.

Latex, when rendered alkaline with the hydroxides of sodium, potassium or barium, did not coagulate at all. It is, therefore, probable that the coagulating enzyme of *Hevea* latex requires an acid medium for its action.

The author states in conclusion as follows:

The natural clotting of *Hevea* latex is aided by the addition of calcium chloride.

So far, salts of other metals have not been found to produce an equal effect. This natural clotting is retarded or inhibited by (1) heating; (2) addition of neutral or faintly acid solutions of precipitants of calcium, namely, potassium oxalate and sodium fluoride; (3) rendering the latex alkaline in reaction; (4) formalin.

In the case of formalin, the phenomena are somewhat complicated by the fact that by the prolonged action of formalin on latex, a peculiar condition of the latex is produced. It retains its superficial appearance but is in reality a suspension of flakes of coagulated rubber in a clear serum, the Brownian movement of the particles having ceased. The factors concerned in the "natural" coagulation of latex are, like those concerned in the coagulation of blood, somewhat complex. In the latter case it is not yet clear how the coagulation is effected.

In view of the uncertainty as to the mechanism of the coagulation of blood it is not proposed to offer explanations as to the mechanism of the coagulation of latex. From the evidence obtained, however, it is fair to assume that:

(1) The natural coagulation of latex depends upon the action of an enzyme.

(2) The action of this enzyme is encouraged by the presence of calcium ions.

(3) The enzyme does not act in an alkaline medium.

(4) According to Whitby the coagulation can take place in the absence of air.

It has frequently been stated by various investigators that latex as it emerges from the latex vessels is alkaline in reaction, afterwards becoming acid on exposure to air. It is possible that the coagulating enzyme is enabled to act only on the development of this acidity.

In the experiments the addition of a given amount of calcium chloride to a given amount of latex on one day did not produce the same effect as an equal amount of calcium chloride on the same amount of latex on another day. The same applies also to the action of potassium oxalate and of sodium fluoride.

This difference is probably due not to the fact that the latices on the two days contained different amounts of enzymes, but rather to the fact that the latices had been examined at different times after collection. The action of the enzyme had already proceeded to a greater extent in one case than in the other.

It is to be noted that the latex contains a carbohydrate, *l*-methylinosite.

Many enzymes appear to be combinations of protein and carbohydrate, and it is possible that *l*-methylinosite may prove to be part of the enzyme of *Hevea* latex.

Serum from pure latex contains up to four per cent of solid matter.

The author is continuing his investigations on coagulation.

THE NATURAL ACCELERATION OF PARA RUBBER.

Dr. Henry P. Stevens has investigated the natural accelerator of Para rubber for the Rubber Growers' Association and presents an extended account of his work in the "Journal of the Society of Chemical Industry" (April 16, 1917), of which the following is a condensation:

In various papers Dr. Stevens has shown that certain constituents normally present in raw rubber are necessary for its satisfactory vulcanization. These constituents are (1) the nitrogenous complex or "insoluble" constituent which is almost wholly insoluble in benzene, chloroform, and similar solvents; (2) matters which can be extracted with acetone—mainly resins. Also the insoluble constituent can be replaced by other nitrogenous matter, such as peptone, to a lesser extent by casein, and to a slight extent by non-nitrogenous substances, such as starch. The acetone-soluble constituents (mostly natural resinous matter) have not been satisfactorily replaced by other resins, such as colophony. From this it may be inferred that the active constituent contained in the acetone extract consists of matter other than resin, although the latter bulks largely. The removal of the nitrogenous matter has the effect of retarding vulcanization, but does not affect the stability of the caoutchouc or the vulcanized rubber. The removal of the acetone-soluble matters not only tends to retard vulcanization, particularly when the rubber is compounded with litharge, but also reduces the stability of the caoutchouc and renders it more readily oxidizable. Numerous analyses failed to reveal any direct relationship between the percentage of nitrogen and the vulcanizing properties of raw rubber.

Dr. Stevens confirms Eaton and Grantham's observations that a more rapidly vulcanizing crêpe rubber is produced by allowing wet coagulated latex to stand for a few days before washing and drying; but he does not find any marked change in the percentage of nitrogen, either in air-dried or smoke-dried rubber from the same latex when subjected to the same detail of preparation and lapse of time before vulcanization.

Peptone, in its power to promote vulcanization, is roughly equivalent to the natural protein matter, and consequently the addition of peptone to a rubber already containing sufficient nitrogenous matter for complete vulcanization will have a very slight effect. Eaton and Grantham have shown that heat-coagulable proteins, which separate on concentration of latex serum have, when added to ordinary crêpe rubber, no influence on the rate of vulcanization. The natural insoluble nitrogenous matter, peptone and other complex proteins, must be sharply dif-

ferentiated from the simpler amino compounds produced by their putrefaction or from the synthetical accelerators. These simpler bodies are far more effective in promoting vulcanization. Hence they accelerate vulcanization in a rubber such as ordinary washed crêpe already containing sufficient protein matter for normal vulcanization. A complex substance, such as peptone, is not so active and consequently does not produce appreciable acceleration. We require to distinguish clearly between the complex nitrogenous substance (protein) which is necessary for normal vulcanization but which can hardly be termed an accelerator, and simpler nitrogenous derivatives which are more effective than proteins and are true accelerators. The latter are able to produce appreciable acceleration in an ordinary raw rubber, while the former cannot. To gage the effect of the former substances as catalysts or promoters of vulcanization, it is necessary to start with a rubber from which the natural insoluble nitrogenous constituent has been removed. A series of experiments has now been made with rubber from which practically the whole of the nitrogenous material has been removed by standing for a period of one to two years in the dark with cold benzene. The clear supernatant solution of rubber was then poured off and the rubber recovered from this by spontaneous evaporation without artificial heat. The original raw material was an unsmoked sheet rubber containing 0.48 per cent of nitrogen. After removal of the insoluble matter the "protein-free" rubber contained only 0.07 per cent of nitrogen. Separation of the insoluble matter was very complete, and it is possible that this small residue of nitrogen was present in some soluble form.

The following "mixes" were made up, on the simple formula of rubber 100 parts, sulphur 10 parts.

1. Untreated sheet.
2. "Protein free" sheet.
3. "Protein free" rubber plus three per cent of the heat coagulable proteins which separated out as a flocculent precipitate on concentrating the serum expressed in sheet making.
4. "Protein free" rubber plus one and one-half per cent of the evaporated liquors after removal of the flocculent precipitate referred to above.
5. "Protein free" rubber plus three per cent of *l*-methyl-inositol extracted from the residual liquors. This represents about the maximum amount of this crystalline substance ordinarily found in sheet rubber.
6. Rubber rich in protein, being the residue of rubber and solvent after pouring off the clear benzene solution.

The following results were obtained, all samples being cured under the same conditions (three hours at 135 degrees C.) so as to illustrate the effect of the different constituents:

	1.	2.	3.	4.	5.	6.
Breaking load, grams per square millimeter	1,360	590	700	940	280	810
Final length (original length = 100)	1,010	1,160	1,040	860	1,110	630
Tensile product	136	68	73	81	32	51
Coefficient of vulcanization	3.66	1.60	3.08	5.28	1.32	6.44
Nitrogen calculated on raw rubber, per cent	0.48	0.05	0.57	0.35	0.05	1.81

In experiments of this type particular attention should be paid to the figures for the coefficient of vulcanization. Tensile figures are more difficult of interpretation, as a low breaking load may be caused not only by under or over-vulcanization, but by the adulteration of the rubber itself.

The results clearly show the effect of the different nitrogenous constituents on the vulcanizing properties of the rubber.

(2) Shows that the removal of the insoluble nitrogenous matter causes a greatly reduced rate of cure. The breaking load has fallen to less than one-half. The elongation is greater and the coefficient of vulcanization is much lower.

(3) Shows that the addition of the insoluble matter which separates from the mother liquor or serum on evaporation causes an increased rate of vulcanization. This insoluble matter behaves

like the natural protein matter retained in ordinary crêpe rubber. The coefficient of vulcanization is almost equal to that of the original untreated rubber. Although the effect of adding the insoluble matter to sample (2) is so marked, it is quite possible that the effect of adding it to sample (1) would have been inappreciable.

(4) The effect of the addition of soluble nitrogenous matter is similar to that of the insoluble nitrogenous matter in sample (3), but is much more pronounced. The coefficient of vulcanization much exceeds that of the original rubber, sample (1). The efficiency of this soluble matter is no doubt due to its containing protein decomposition products. In the main it will consist of *l*-methylinositol.

(5) Shows that the effect of the addition of the methylinositol is to retard vulcanization.

(6) This sample contains a large excess of the insoluble nitrogenous matter (protein) naturally present in rubber. Its effect has been to increase the rate of cure. Both samples (4) and (6) are much over-vulcanized. The percentage of nitrogen in sample (6) is 1.81, in sample (4) it is only 0.35. Yet the effect of the larger proportion of nitrogenous matter on the coefficient of vulcanization and physical properties in sample (6) has not been very much greater than that of the small proportion of soluble nitrogenous matter in sample (4). This clearly illustrates the difference between the action of the insoluble and soluble nitrogenous matters.

The conclusions to be drawn from these results are that complex nitrogenous matter (protein) promotes vulcanization, and that naturally present in the rubber is necessary to secure vulcanization within reasonable limits of time and temperature. There are, however, simpler nitrogenous substances, probably formed by the decomposition or gradual breaking up of the complex proteins by the action of micro-organisms which are far more active as vulcanizing agents than the proteins themselves.

Some measure of the efficiency of the organic bases produced during putrefaction of latex serum was worked out experimentally, resulting in this conclusion, namely: The organic bases separated and used in these experiments are not volatile or not readily volatile. The putrefaction of latex serum might well give rise to volatile bases and such are indeed formed. Their presence can be shown by cutting up matured slab into small pieces and distilling in steam.

In general the experimental results show that the rapid curing property of matured coagulum is due to organic nitrogenous bases formed during putrefaction, as small quantities of these bases can be extracted from the rapidly curing rubber which has undergone putrefaction, while only a trace can be extracted from the ordinary pale crêpe. Further, that similar bases can be extracted from the residual liquors and very small quantities of these bases have been shown to have very marked effect in promoting vulcanization.

COAGULATION OF LATEX IN PRESENCE OF SUGARS.

The work of Gorter and Swart on the coagulation of latex in the presence of sugars is presented in Bulletin No. 6 of the West Java Rubber Testing Station and given here as condensed by "Chemical Abstracts."

Gorter and Swart confirm the observations of Eaton and Grantham that coagulation results from the action of micro-organisms and is favored by the presence of sugars. They also further find that the sugar undergoes a complicated fermentation, producing lactic acid (mainly) with some acetic and succinic acids. The resultant acidity is the real cause of the coagulation. The amount of acid formed is dependent on the amount of sugar present, but excess sugar inhibits fermentation and consequent acidity. Lactic acid plays an important part in the slow coagulation with acetic acid in minimum quantities. Latex contains 2.3 grams of sugar per liter, which is too little to help

the lactic fermentation in competition with other organisms; hence the addition of sugar is necessary. For large quantities, Gorter and Swart recommend 400-450 grams of sugar in 50 liters of water for each 175 liters of latex. The disadvantages of the process due to discoloration of the rubber, and the fact that only crêpe can be prepared, are discussed. It is pointed out that sugar is cheaper than acetic acid.

B. J. Eaton ["Agricultural Bulletin Federated Malay States," Vol. 5, 52 (1916), through "Chemical Abstracts"] has demonstrated that rubber prepared by coagulation in the presence of sugar is in every respect equal to acetic acid coagulated samples, and has a tendency to vulcanize faster. Crêpe of excellent color can be prepared by coagulation in the presence of sugar in a closed vessel, and subsequently soaking the coagulum for 24 hours in a five per cent solution of bisulphite of soda, as is done in the case of "lump" rubber or cup coagulation. The exclusion of the air during coagulation prevents any preliminary darkening due to oxidation.

COAGULATING AGENTS FOR SHEET RUBBER.

Coagulating agents for sheet rubber are discussed by Gorter and Swart in Bulletin No. 6, West Java Rubber Testing Station (through "Chemical Abstracts"). The work relates to the use of various acids and salts for coagulating and the possibility of their ultimate effect on the rubber. Hydrofluoric acid, sulphuric acid and alum are not recommended, especially in the manufacture of sheet, where a portion of the acid or salt is retained in the rubber. Experiments with the milk of young coconuts show a content of five per cent sugar and an acid content of only 0.4 per cent after seven days and of 0.46 per cent after 15 days. About half of the acid content was lactic acid, which probably inhibited the development of the acetic acid fermentation, and explains the low acetic acid content.

METHODS OF ANALYSIS.

DETERMINATION OF MINERAL MATTER IN VULCANIZED RUBBER.

J. P. PÉRÉGRIN in "Annales de Chimie Analytique" (February 15, 1917), refers to the inaccurate results obtained by direct incineration of rubber, due to losses of zinc, antimony and lead in the process, stating his method as follows:

One or two grams of finely rasped vulcanized rubber is heated with 50 to 100 grams of anisol for six hours at 100 degrees C. with frequent agitation until the rubber ceases to swell. Pure benzene is then added in large excess and after standing several days the mineral matters in the mixture are separated by centrifugal force.

The author prefers anisol to salol because the latter is too expensive. Cresol is not favored because it affords unsatisfactory results.

CELLULOSE IN RUBBER.

A method for the determination of cellulose in rubber by G. H. Hillen ["Gummi Zeitung," 670-1 (1916)] is given as follows, through "Chemical Abstracts" (May 10, 1917):

Regenerated rubber and rubber freed of fabric by the mechanical process may contain cellulosic residues. For their determination Hillen recommends treating 0.2 grams of the finely divided material with 30 cc. of Schweitzer's reagent, allowing the mixture to stand six to ten hours without stirring; filter through a gooch and wash with ammoniacal water until the wash water shows no color; acidify the united cellulose solution and wash waters with dilute sulphuric, filter the precipitated cellulose on a gooch, dry and weigh. The following points are of special importance: (1) The sample must be carefully selected and prepared by rasping with a file or similar means; (2) the Schweitzer reagent must be carefully prepared; (3) the beaker containing the sample and reagent must be well covered to avoid loss of ammonia; (4) the precipitated cellulose must not be left long in contact with the dilute acid, lest inversion occur; (5) since the voluminous cellulose easily clogs the filter, the moist precipitate

should be mixed before filtration with alcohol or acetone. The method is sufficiently accurate for technical purposes.

CHEMICAL PATENTS.

THE UNITED STATES.

PROCESS OF TREATING AUTOMOBILE TIRES AND INNER TUBES. Thickened neats' foot oil is applied to the inner wall of the tire shoe for impregnation of the shoe and surface coating the inner tube. [Frank S. Walton, Philadelphia, Pennsylvania. United States patent No. 1,223,302.]

RUBBER SUBSTITUTE. A composition of matter for use in the manufacture of vehicle tires and like purposes, including Para rubber, 8 parts; Kieselguhr, 2 parts; fuller's earth, 2 parts; asbestos, 3 parts; oxide of lead, 5 parts; sulphur, 1 part; aluminum wool, 2 parts; cotton, 2 parts, and wood pulp, 4 parts. [Francis A. Halsey, Philadelphia, Pennsylvania, assignor of one-fourth to Charles Hamilton, Philadelphia, Pennsylvania. United States patent No. 1,223,692.]

THE UNITED KINGDOM.

PACKING. A composition of about equal parts of rubber and mineral oxides, such as zinc oxide or silica, is used as a packing for steam, air or hot water. [E. T. Williams, 11 The Drive, Golder's Green, London. British patent No. 103,776 (1917).]

RECLAIMED RUBBER. A plastic mass made by heating such salts as aluminum, calcium or magnesium stearate, or iron, calcium or magnesium palmitate with an oxidizing oil. In an example, 1 part of aluminum stearate, dissolved in the same or a smaller quantity of ozokerite or the like, is mixed with 4 to 10 parts of oxidized linseed oil at 200 to 250 degrees C. The product may be vulcanized, with addition of rubber, asphalt, magnesia, Kieselguhr, chalk, red lead, etc. [E. S. Ali-Cohen, 43 Stadhoudersplein, The Hague. British patent No. 103,824 (1917).]

THE FRENCH REPUBLIC.

COAGULATION. Process and apparatus to determine the volume of acid needed to coagulate a given volume of rubber latex. [T. Cockerill. French patent No. 482,020.]

LABORATORY APPARATUS.

RUBBER EXTRACTOR.

A PIECE of apparatus known as the New York Testing Laboratory Extractor, while originally designed for the extraction of asphaltic materials, is a valuable acquisition to the rubber laboratory, particularly for the chemist whose work requires the

THE VARIOUS PARTS AND THE ASSEMBLED EXTRACTOR.

extraction of large samples of rubber with volatile and inflammable organic solvents. It can be used with any solvent commonly used in rubber analysis. The extractor combines safety, capacity, efficiency, durability and economy of solvent. It is made entirely of metal and is electrically heated, and was designed by Charles P. Fox. [Howard & Morse, 1197 DeKalb avenue, Brooklyn, New York.]

YOUNG'S GRAVITOMETER FOR LIQUIDS.

Young's Gravimeter for liquids is a new instrument designed for accurate and rapid determination of the specific gravities of liquids. The regular range of the instrument is 0.600 to 2.000. From 0.600 to 0.700 no weight is required, but a different weight is furnished for each 0.100 of gravity. For the range 0.600 to 2.000 there are required 14 weights. The second and third decimal places are shown on the scale.

In making a determination the plummet is immersed in the

liquid to be tested. If the pointer swings between 0 and 100 on the scale, the specific gravity is 0.600 plus the reading of the pointer on the scale. If the pointer swings beyond the 100 mark, it is necessary to place on the hanger of the plummet the one weight which will bring the pointer between 0 and 100. This weight gives the first decimal place, and the remaining two places are read at once from the position of the pointer on the scale. Higher ranges and special weights are provided for specific quantities above 2. [Eimer & Amend, 211 Third avenue, New York City.]

RUBBER HOSE FOR USE ON AIRPLANES.

A PAPER on the construction and tests of gasoline and other hose for use on airplanes may be found in "The Journal of Industrial and Engineering Chemistry" (April, 1917), by Percy A. Houseman, formerly chief examiner, Aeronautical Inspection Department Laboratories, London, England. Previous to initiating a system of inspection in England the quality of rubber used for gasoline on airplanes was quite unsatisfactory. The following specifications and tests for gasoline hose were found suitable for controlling the quality.

FLEXIBILITY. The hose is bent to a circle having a diameter D which varies according to the inside diameter of the hose d as follows: Up to one-half inch, $8d$; nine-sixteenths to one inch, $10d$; one and one-sixteenth to one and one-half inch, $12d$; over one and one-half inch, $14d$. The diameter of the tube so bent should not change at any point by more than ten per cent from its original diameter.

IMMERSION IN GASOLINE. A three-inch sample of the hose is boiled in gasoline for one hour under a reflux condenser, followed by 24 hours' standing in gasoline at room temperature. The approximate increase in weight and volume of the sample is recorded. The decrease in bore at narrowest part should not exceed 25 per cent.

The adhesion of rubber to canvas must remain good, and the "nerve" of the rubber must not be seriously impaired when examined immediately after the gasoline treatment.

PERMEABILITY TO GASOLINE. A sample of the hose 14 inches long is held vertically and plugged with a glass stopper at the bottom. A glass tube is fitted in the top, and is filled with gasoline to a head of 12 inches above the top of the hose sample. The length of the hose exposed to the action of the gasoline is 12 inches. The level of the gasoline in the glass tube should not be allowed to fall more than three inches, additions of gasoline from a known volume being made as necessary. The amount of gasoline which permeates through the walls of the hose is noted during the first and second days, as a guide to the behavior of the sample. During the third 24 hours, by which time the rate of permeation has become approximately constant, the gasoline passing through the walls should not exceed 100 cc. per square foot of original internal surface.

DRY HEAT. A piece of the tube is heated for two hours at 132 degrees C. The rubber should remain elastic and show no signs of stickiness or brittleness, nor should any surface cracks show on stretching the sample.

ACETONE EXTRACT. Free sulphur, mineral sulphides and sulphur of vulcanization are determined. The free sulphur should not exceed one per cent.

ASH. The amount and composition of the ash are determined.

QUALITY OF CANVAS. This is left to the judgment of the manufacturer.

Rubber hose for use with gasoline on French airplanes is required to contain 45 per cent mineral matter with a margin of 5 per cent; 50 per cent rubber with the same margin, and to have a density of 1.6 (0.1).

The preferred construction of gasoline hose consists in preparing the fabric with a layer of rubber on one side double the thickness of the fabric, so that in cross section of the finished hose the fabric is embedded as a spiral in the rubber. Such a hose shows improved flexibility, better behavior under the immersion test and less tendency to separation between rubber and fabric, and a smaller constriction of the bore. Two plies of fabric are used in five-eighths-inch hose; three plies between five-eighths and one and one-quarter-inch hose, and four plies for larger sizes. The larger sizes are used for oil and water.

TURPENTINE AND ROSIN IN RUBBER MANUFACTURE.

ALTHOUGH classed as "naval stores," turpentine and rosin are used to-day for a wide variety of purposes having nothing whatever to do with shipping. A list recently prepared by the Bureau of Chemistry, U. S. Department of Agriculture, gives 44 industrial uses of turpentine, 67 uses of rosin, 20 uses of rosin oil and rosin oil products, and 13 uses of pitch. Those applicable to rubber manufacture follow:

TURPENTINE

Solvent for gums in varnishes.
Ingredient of waterproof cements for leather, rubber, glass, metals, etc.

Solvent for waterproofing compositions.
Raw material for producing isoprene used in making synthetic rubber.

In rubber substitutes.
Solvent for rubber, caoutchouc and similar substances.

ROSIN.

Rubber substitutes.
Adulteration of ceresin and paraffin waxes.
Adulteration of shellac and certain resins.
In waterproofing compositions for paper, cardboard and fabrics.
In the manufacture of condensation products.

ROSIN OIL AND ROSIN OIL PRODUCTS.

Rubber substitutes.
RUBBER.
Rubber compounding.
To which might be added the use of rosin oil, pitch and rosin in frictions, tapes, etc.

Of value for daily reference in every rubber office—"The Polyglot Rubber Trade Directory, 1916."

New Machines and Appliances.

MACHINE FOR MAKING ASBESTOS SHEET PACKING.

THAT the manufacture of Klingerit packing has progressed in England since the war is shown by the following illustrations of a novel machine specially designed for making high pressure packing. The mechanical operation is in general the same as the German mill, illustrated and described in the article on the manufacture of Klingerit steam packing that ap-

peared in THE INDIA RUBBER WORLD, March 1, 1917. There are, however, special features in this new machine that are of sufficient interest to warrant a brief description.

A front and side view is shown in the first illustration, the small roll being adjusted to the large roll by worm and pinion gearing operated by two hand disks. Both rolls are chambered for heating and cooling purposes and are revolved by worm wheel and pinion gearing driven by belt power. The machine is started and stopped by independent levers, one being located

at the front and the other at the back of the machine, that control a friction clutch mounted on the pinion shaft.

The prepared dough is fed to the rolls in sufficient quantity to build up a thin sheet on the large roll. A solution of rubber and balata is then applied and another sheet is built up on the first one in the same manner and solutioned. When the packing has been built up to the desired thickness, the machine is stopped and the sheet is cut transversely by the hand-operated cutting device attached to the side frames at the back of

the machine and shown in the second illustration. Just above the transverse cutting device are located the cutting rollers that trim the edges of the sheet.

The upper end of the cut sheet is then passed over the top roller of the winding frame, shown in the second illustration, and wound up on the lower or windup roller that is belt driven from the upper roller. This roller is driven from a countershaft that is attached to the opposite side of the machine and is driven from the front roll. The rolls are of chilled cast iron, the small roll measuring 18 by 41 inches and the large roll 51¼ by 41 inches. Compressed asbestos sheets in varying widths up to 40 inches and 161 inches long may be made on this machine. [Hampson Bros., Limited, Manchester, England.]

ROSTERN PACKLESS SWING JOINT.

The manufacturers of rubber goods are so well aware of the difficulties experienced with leakage in packed joints and hose connections that the following description of a new type of

flexible joint is of interest. Being made entirely of metal it resists high pressure steam, the action of volatile oils and the constant effort

of air to escape at the joints. Moreover, it is said to be unaffected by heat and cold, having been tested with steam at 350 degrees F., alternating with cold water at 64 degrees F. The construction will be readily understood by referring to the illustration in which *A* is a hollow cylinder having a ball-shaped shoulder *B* that revolves on an anti-friction metal bearing ring *C*, kept in close contact by a spring *D*, also by the pressure of steam or liquid passing through the joint. The cylinder *A* is kept in alignment by revolving in a socket *E*. *F* is the body and *H* its cap. These enclose all the other parts.

The spring *D* is made of a cast metal which is not affected by changes of temperature and is guaranteed to keep a constant pressure during the life of the joint.

For vulcanizing presses, two styles are recommended, the Flexible and the Standard; two of the former and one of the latter are usually sufficient for a connection between two platens. These joints are used in connection with ordinary iron pipe on elbows and carry the guarantee of the manufacturer. [Rostern Co., Peoples Gas Building, Chicago, Illinois.]

DINGS MAGNETIC SEPARATOR.

The reclaiming of rubber scrap for reuse includes various processes among which that of metal separation by means of magnets is of importance. Such equipment is used to prevent damage to crushing and grinding machinery due to "tramp" iron frequently found in rubber scrap. Magnetic pulleys are recommended where large quantities of coarse material are to be handled and the iron to be extracted is limited in quantity.

In operation the material is fed upon a horizontally inclined belt conveyor passing over a magnetized pulley. The non-magnetic material falls by gravity from the brow of the pulley

into a suitable receptacle or to a conveyor leading to final delivery, while the iron and magnetic material is attracted and held firmly against the belt until it is carried to the point where

the belt leaves the pulley on the under side and is there discharged back of a partition set a few inches beneath the pulley in line with its axis.

The conveyor is usually a rubber belt of the best grade, heavy, and mechanically strong enough for the material to be handled. It should be made endless, so that no dust or fine material can work through at the splice. The belts are usually run at a speed of about 100 feet per minute and should be supported by rollers placed at suitable intervals. [Dings Magnetic Separator Co., Milwaukee, Wisconsin.]

A SANITARY WATER COOLER

Sanitary drinking fountains that supply pure cool water to the operatives are now considered necessary in the equipment of modern rubber mills. As a rule the fountains are placed at convenient points in the factory to which the cold water is piped from a central refrigerating station, a system that requires considerable outlay in equipment and piping while if the mill is a large one, pumping will be necessary.

drinking device is of special construction and is controlled by a valve that closes automatically when the bubbler is not in use. The ice chamber is insulated and occupies the central part of the fountain. It is surrounded by the cooling coil through which the drinking water circulates. The ice chamber holds about 100

pounds of ice that under ordinary circumstances will last 1½ days. There is a waste pipe connection and an overflow connected to the bubbler. [Ebinger Sanitary Manufacturing Co., Columbus, Ohio.]

MACHINERY FOR EXPELLING OIL FROM HEVEA SEEDS.

It will not be many years hence when the 1,500,000 acres of *Hevea* planted in the Far East will produce enormous quantities of rubber seed that should be turned into useful products and at a profit to the estate owners. Experiments in the extraction of the oil contained in rubber seed have shown its practical utility in several ways, but particularly in the manufacture of soap. As a forward suggestion an illustrated description of a typical plant for this purpose follows: The illustration shows the front elevation of a complete one expeller oil plant that is continuous in operation. The seed is spouted into the roller mill and after being ground is elevated into the tempering apparatus. In passing the entire length of this apparatus it is slightly warmed and then drops into the hopper of the expeller. Here the pressing of the seed is performed in a perforated hardened steel cylinder, in which revolves a shaft, carrying a series

of hardened steel screws that produce a gradually increasing pressure that is regulated by a hardened steel cone. The oil is expelled through the perforations of the cylinder, drops in the oil strainer, and from thence into a pan. The foots accumulating in the strainer are fed automatically into the elevator which returns them into the feed hopper. The pressed cake is discharged at the opposite end of the cylinder. This makes an entirely automatic and continuous operation, from the moment the seed enters the mill until the oil is pumped into the filter press, and from thence into the barrel or storage tank, and the cake sacked or fed into the grinding mill.

All seeds may be pressed cold, and without grinding, but the best results are obtained by flattening and coarse grinding the seeds and then slightly warming the ground stock in the tempering apparatus, before introducing it into the expeller. By this method is obtained a maximum yield, without injuring the quality of the oil. Moreover, the oil from the machine can be at once pumped through the filter press and at the end of the day's run, or at any time during the run, the operator can tell exactly the yield of filtered oil that is being obtained from the material under treatment. No settling tanks are required when using this process, thus saving much valuable space.

The oil is practically cold pressed, the meal being warmed to

140 degrees F. in the tempering apparatus, which is not sufficient to harden the albumen, and consequently this remains in the cake. It is for this reason that the oil, containing no albumen, is of vastly superior quality. In the case of linseed oil it will not break, *i. e.*, it remains perfectly clear at a temperature of 800 degrees F., which makes it much more valuable for paint and varnish purposes than the old process oil. In the case of cottonseed oil and all other edible oils, it will make much sweeter oil, which refines more readily, and with smaller loss. As to the cake, the larger percentage of albumen makes it more valuable, inasmuch as the albumen is more easily digested in its raw state than when cooked. Cooked seed may be also pressed, obtaining the same yield as by the hydraulic process, and at a considerably lower cost. Less horse power is required for pressing cooked seed, and a larger quantity of seed can be pressed hourly, but while the products from the cooked seed are equal in quality to the best results obtained from the most improved hydraulic presses, they are not equal to the oil and cake obtained from the cold or tempered seed, as described above.

The plant working automatically effects almost a complete saving of labor. The machinery once started, one man can run a plant of at least six expellers, while by the hydraulic process four men are required to obtain the same results. It also eliminates the cost of expensive press cloths. [The V. D. Anderson Co., Cleveland, Ohio.]

PFYFFER'S RESILIENT WHEEL WITH PNEUMATIC HUB.

This is a resilient wheel that embodies the pneumatic principle without the wear and tear, punctures and blow-outs common to the average pneumatic tire. With slight variation in structure it is adaptable to heavy trucks, pleasure cars, bicycles and motorcycles.

Contrary to ordinary practice, the drive is transmitted directly to the rim section, thereby relieving the pneumatic part of the wheel from driving strains. The hub consists of two normally concentric main parts, one being revolvably secured to the axle, while the other is rigidly secured to the rim of the wheel. Interposed between these parts is a ring-shaped cushioning member, *A*, preferably a pneumatic tire, with a convex-shaped outer circumference. This modified pneumatic tire is mounted upon a cylindrical steel sleeve, *B*, which is secured to the axle, revolving around it in the usual way on ball or roller bearings, according

to the weight of the vehicle. The tire is held between two circular steel disks, *C*, which are secured to the sleeve, *B*, and support the tire on two sides, leaving the convex-shaped outer circumference free.

The principal feature of the invention comprises a ring-shaped steel casing, *D*, convex in cross-section, that encircles the tire and comes in contact with it, providing a narrow steel track upon which the tire rolls when revolving under

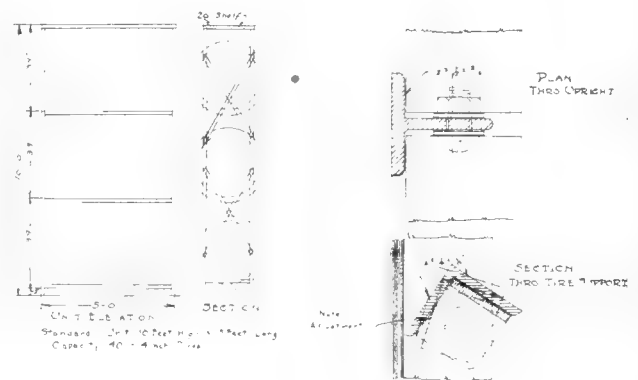

pressure. Thus the cushioning quality of the ordinary pneumatic tire is retained and punctures and blow-outs are eliminated.

Two circular-shaped steel plates, *E*, with an open center to allow play in a radial direction, are secured to the sides of the casing. Between the inner disks, *C*, and these outer disks, *E*, are anti-friction ball bearings, *F*, that take up the lateral forces while allowing radial play of the two concentric parts of the hub without friction between them. The wheel travels on a solid or block tire and is driven by chain drive, the sprocket wheel, *G*, being secured to the outer disk, *E*.

The illustrations show three variations of construction, the one on the left being the smallest type and the one on the right giving the greatest cushioning effect, while a circular-shaped tire occupying a place between these extremes is outlined in the same illustration. An additional factor of safety is provided by two ring-shaped cushions, *H*, of solid rubber that receive the weight on the wheel should the tire become deflated. [Paul de Pfyffer, 302 West Twenty-second street, New York City.]

CARLL STEEL TIRE RACKS.

When pneumatic tires have been finished, inspected and paper wrapped, they are sent to the storeroom, where they are segregated according to size and type. The racks on which they are placed are often built of wood and according to the individual ideas of the executive or superintendent. It is claimed that

wooden racks absorb moisture and dry out the tires to the detriment of the aging qualities of the stock in storage. However serious this may be, the substitution of all-metal tire racks for storage purposes has many advantages. For example, the system here shown permits the use of standard three-tier units, 5 feet long and 10 feet high, with a capacity of 40 4-inch tires. The angle iron supporting the tires is adjustable to accommodate tires of large and small diameter in such a manner that they rest on the flat surface of the angle irons. The construction is obviously strong, light and fireproof, while economy of factory space and the easy addition of units for storage extension are interesting features.

The first cost is said to be about equal to that of wood construction; moreover, the metal racks may be easily taken down and reassembled if so desired. A low insurance rate and minimum depreciation in value are the final advantages claimed by the manufacturers. [Chas. W. Carll's Sons, Trenton, New Jersey.]

MACHINERY PATENTS.

MOLDING ELECTRICIANS' GLOVES.

THE entrapping of air and the formation of bubbles are difficulties that are incidental to making electricians' rubber gloves by the dipping process.

The present invention enables the production of a seamless, molded glove, the thumb being positioned opposite the forefinger with a space intervening, and one that is reinforced where strength and thickness are desired.

The mold, consisting of four parts, *A*, *B*, *C* and *D*, is shown in the illustration. *A* and *B* are the lower and upper mold

parts and *C* is the core. *D* is the part that occupies the space between the thumb and forefinger, the upper face forming the index and a portion of the middle finger, while the opposite face, shown at *E*, forms the balance of the thumb. Six pieces, destined to form the various parts of the glove, are cut from calendered stock and placed in their respective positions in the mold, which is then assembled and subjected to heat and pressure in a vulcanizing press. [Richard T. Griffith, assignor to The Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,225,028.]

DRIVING CLUTCH FOR MILL ROLLS.

Usually the large driving gear of mills and grinders is attached to the back roll and driven from a clutch-controlled pinion keyed to the main driving shaft. According to the present invention the large gear shown in the illustration at *A*, rotates loosely on the roll. Keyed to the end of the roll is a clutch drum surrounded by a heavy spring coil *B*, that grips or releases the drum. The clutch actuating mechanism comprises a sliding collar *C*, provided with two oppositely placed arms carrying a guide pin and a clutch operating pin that is pivoted to the arms of a bell-crank lever attached to the hub of the large gear. A split ring *D* surrounds the collar and is connected by two arms to a rock shaft *E*. A vertical arm attached to the rock shaft supports at its upper end a threaded rod on which a combined nut and hand wheel *F* is mounted. When this is rotated in the proper direction the nut contacts with the vertical arm, thereby rocking the shaft, and the sliding collar operating the bell-crank connections tightens the coil clutch on the drum and connects the driver to the shaft. When the hand wheel is rotated in the opposite direction, the vertical lever is released, the collar slides back, aided by spring action, the coil frees itself from the drum and the machine stops. It is also equipped with a safety stop device whereby the machine may be instantly stopped by the operating rod that is arranged above the roll within reach of the operator. [David R. Bowen, assignor to Farrel Foundry & Machine Co.—both of Ansonia, Connecticut. United States patent No. 1,225,309.]

RUBBER SHOE VARNISHING MACHINE.

This machine comprises an endless chain conveyor that carries the lasted shoes past a series of nozzles from which shoe varnish is discharged, covering the shoes with a coat of varnish. The illustration is a transverse section of the machine at the point where the varnish is applied.

In operation the successive sticks of shoes are placed in the traveling holders and carried between the nozzles *A*, *B* and *C*, that direct a flow of varnish against the shoes as they pass in succession. The surplus varnish drains into the trough *D* and flows by gravity to the receiving tank *E*, from which it is continuously supplied to the discharge nozzles by the pump *F*. The machine is of sufficient length so that the surplus varnish will drip from the shoes into the trough. It may be so constructed that the sticks of varnished shoes can be taken from the machine and placed directly on the racks of the vulcanizing heater. [Le Baron C. Colt, assignor to National India Rubber Co.—both of Bristol, Rhode Island. United States patent No. 1,225,013.]

MACHINE FOR WINDING GOLF BALL CORES.

Elastic thread is wound in different great circles around the core, at the same time being evenly distributed over the entire body of the ball by the automatic action of the machine here shown. The upper illustration is a side elevation and the lower view is a plan of the machine.

The two side frames *A*, support the mainshaft *B*, that is provided with a hand wheel and belt drive. Pivoted on this shaft are two horizontal arms *C* and *D* that support the bearing *E*, through which pass a tubular and a solid shaft. Directly under the upper bearing is a similar bearing bolted to the frame and through which pass tubular and solid shafts similar to those in the upper bearing. The spur gear *F*, fixed to the main shaft, meshes with two sets of pinions of different pitch, being keyed to the upper tubular and solid shafts, respectively, while the other two pinions are keyed to the lower tubular and solid shafts. On the opposite ends of the upper shafts are two knurled disks *H*, and similar disks *I* are attached to the corresponding ends of the lower shafts. Due to the different pitch of the driving pinions the inside upper disk revolves at the same speed as the lower outside disk, and the upper outside disk revolves at the same speed as the lower inside disk, the former

pair rotating slightly faster than the latter pair. A ball retained between these disks will be rotated slowly about an axis which passes through the axes of the two shafts, then winding the elastic thread in different circles around the core.

The ball is held in position by rollers *J* and *K*, mounted on the ends of two pivoted arms provided with spring tension. For removing the ball, the upper bearing, being pivoted to the main shaft, is raised and lowered by the handle provided for that purpose. [Martin McDaid, Leith, Scotland, assignor by mesne assignments to Revere Rubber Co., a corporation of Rhode Island. United States patent No. 1,224,397.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- 1,223,636. Automatically acting device for coating the yarn elements from which a laminated cohesive interwoven fabric band is constructed. L. A. Subers, East Cleveland, Ohio.
 1,223,726. Mold for solid tires. M. C. Overman, New York City.
 1,225,584. Tire vulcanizing mold. H. Cooney, Marion, Ind.
 1,225,593. Pneumatic tire building apparatus. P. and B. De Mattia—both of Clifton, N. J.

THE UNITED KINGDOM.

- 103,690. Hose-making machine. G. Warwick, 50 Colman Road, Seven Kings, Essex, and A. P. Crouch, 106 Cannon street, London.
 103,819. Repair vulcanizer. Marvel Accessories Manufacturing Co., 1220 West Sixth street, Cleveland, Ohio, U. S. A.
 104,210. Plantation washer for treating and extracting india rubber. A. A. Thornton, 8 Quality Court, Chancery Lane, London.
 104,323. Apparatus for coagulating india rubber. G. M. Thomas and M. D. Maude, Cicely Estate, Teluk Anson, Perak, Federated Malay States.
 17,911 (1915). Mechanically operated tire mold. J. H. and J. H. Coffey, 73 Jameson avenue, Toronto, Canada.

THE DOMINION OF CANADA.

- 174,533. Apparatus for cutting and reeling tire fabric. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of D. Neil, Detroit, Michigan, U. S. A.
 174,549. Vulcanizer door. The Williams Foundry & Machine Co., assignee of H. L. Williams, both of Akron, Ohio, U. S. A.
 174,579. Apparatus for manipulating fabric rolls. E. B. Cederstrom, Detroit, Michigan, U. S. A.
 174,596. Pneumatic tire mold. J. Girard, Montreal, Quebec.
 174,646. Tire building machine. R. L. Taft, Hartford, Connecticut, U. S. A.
 174,532. Apparatus for exhausting the interiors of rubber articles. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of C. J. Randall, Naugatuck, Connecticut, U. S. A.

THE FRENCH REPUBLIC.

- 482,214 (March 17, 1916). Improvements in accumulator tanks. W. L. Walker.

PROCESS PATENTS.

PREPARING AND APPLYING ADHESIVE COATINGS WITHOUT SOLVENTS.

ACCORDING to this invention the fabric used for making "Gem" insoles is coated with adhesive without the use of solvents. Gutta percha, pontianak, balata or other gums that become plastic and adhesive when heated are mixed with wax on the mill *A*, shown in the illustration. The dough is then transferred to the tank *B*, containing water heated to a temperature of about 200 degrees F. From here the softened material is fed to the mixing and straining machine *C*, where it is tempered and

softened to the right consistency for spreading. The strained material is then directed to the spreading machine *D*, which applies

the coating to the fabric. The spreading knife is attached to a hollow support heated by steam that maintains the coating material in a plastic condition during the spreading operation. [James Meade, Stoughton, Massachusetts. United States patent No. 1,222,967.]

METHOD OF MAKING TIRE FABRIC.

TIRE building fabric is made by braiding the fabric upon a series of annular cores of the size and shape of the tire casing. The bands thus formed are cut circumferentially and used for building the casings of pneumatic tires.

The illustration shows a series of collapsible cores placed one upon the other and around which the fabric is formed by any preferred form of braiding mechanism. The forms may be either moved upward or downward during the braiding operation. When they are moved upward those on which the fabric has been braided are removed from the top and others added at the bottom, thereby permitting a continuous operation of the machine. The yarn may be impregnated with or laid in rubber during the braiding process. [George F. Fisher,

Plainfield, New Jersey, assignor to The Hartford Rubber Works, Hartford, Connecticut. United States patent No. 1,224,878.]

METHOD OF MAKING ELECTRICIANS' GLOVES. A glove with the thumb positioned opposite to the fingers and reinforced on the inside of the thumb, fingers and palm, is made in a mold from sheet stock and press cured. [Richard T. Griffiths, assignor to The Miller Rubber Co., both of Akron, Ohio. United States patent No. 1,225,027.]

MISCELLANEOUS PATENTS.

A FRENCH CUSHION TIRE.

IN this tire, the inner tube that is usually employed in ordinary pneumatic tires is replaced by a thick tube of flexible rubber, the central opening of which is ovoid shaped. The walls are

thinnest at the tread part and thicker at the base. A valve is provided that permits the air to escape or enter the tire automatically.

The improvements are as follows and consist in corrugating the walls of the tire, shown at *A*; in providing the exterior of the tire with fabric plies *B* to prevent wear when it is covered with a casing, as shown at *C*, and in securing the tire to the rim by bolts, *D*.

This tire may also be used directly on the rim without a casing. In this case it is provided with beads *E* that fit into corresponding channels in the rim. The tire may be divided along its annular circumference as at *F*, and provided with expansible sleeves *G* and tapering bolts *H*, the action of which expands the beads and holds the tire firmly in place on the rim. [A. Broussois. French patent No. 481,850.]

New Goods and Specialties.

JAPANESE RUBBER TOY.

A REMARKABLY realistic conception is this modest little toy from Japan. Nestling between leaves of green paper is a small bud or blossom made entirely of rubber, in yellow, tipped with red, the whole being securely fastened to a

bamboo stem. Blowing into this stem at its opposite end causes the blossom to gradually expand until it becomes a life-like representation of a luscious, full-grown apple.

COMBINATION BALL.

With this new toy for children many tricks may be performed. Its construction is exceedingly simple. A small white rubber ball with a ribbed surface is threaded with a long string of red rubber upon which it slides and whirls at the pleasure of the owner. [Robert J. Mulvey, Chicago, Illinois.]

PNEUMATIC HORSE COLLAR.

Padding is essential in a horse collar for protection, but it adds considerably to the weight of the collar and consequent burdening of the animal. A solution of the problem is offered in the form of a horse collar embodying a pneumatic pad built up similar to an automobile tire. Each side of the collar is a chamber of suitable shape to receive an inner air tube, which is blown up with a tire pump; and it is claimed that this collar is not only extraordinarily light in weight but fits better than most on the neck of the horse.

NO-GLARE AUTO SHADE WITH RUBBER WASHERS.

A convenient protection against motoring accidents caused by reflecting sun or strong headlights is afforded in the accessory

shown herewith. It takes the form of a blind, or window shade, with a transparent section, fastened to a spring roller and operating like an ordinary spring blind. A heavy rod along the bottom serves to maintain the curtain in position, and rubber rings at the ends of the rod and the spring roller keep these parts from injuring the glass in the wind-shield. The vision opening is of transparent pyralin, measuring 8 by 8 inches, the entire shade being over 12 inches long and enclosed in a nickel-plated or black enamel cylinder. [No-Glare Auto Shade Co., 3301 North Main street, Los Angeles, California.]

HOME HELPS DISH WASHER.

A device to facilitate the inevitable duty of dish washing and obviate its disagreeable features is shown herewith. One end of a rubber hose, specially compounded for hot water conduction

and measuring two feet in length and one-quarter inch in diameter, is attached to the hot water faucet by a special connector with a rubber gasket which insures a perfectly tight fit. At the other end of the hose is a scouring brush with a rubber ring around its edge which serves as a buffer and protects the china. Between this brush and the hose is an ingenious spraying arrangement by means of which hot soapsuds or clear hot rins-

ing water flows upon the soiled dishes, the user simply holding the device by its handle and manipulating a button. A wire drying basket is also furnished with the outfit and no dish pan nor towels are required in the operation. [Home Helps Manufacturing Corp., 39 West Thirty-eighth street, New York City.]

BATHING COSTUME NOVELTY.

The latest accessory to the feminine bathing costume now being shown in department stores is the water-proof bag for carrying the bathhouse key and valuables. This attractive and convenient novelty is made of rubberized material, with a rustproof clasp which fastens securely, and is attached to the wearer by a belt strap.

INFANT'S DRESSING TABLE WITH RUBBER-TIRED WHEELS.

To hold a lively infant in the lap during the operation of clothing its kicking, wriggling limbs presents difficulties possibly unrealized by the lay mind, but well known to mothers and nurses through difficult experience. A mechanical aid which should find ready sale as an accessory to the nursery furnishings is the portable dressing table shown herewith. Solid rubber-tired wheels allow it to be moved about easily and noiselessly. The substantial steel frame, finished with baked white enamel, rigidly locks when in use but folds and stands alone when not required, occupying very little space. The 32- by 19-inch top is made of a special kind of leatherette which can be easily washed, thus affording the perfect sanitation so essential to the baby's welfare. [The Kolb Specialty Co., 4909 N. Eleventh street, Philadelphia, Pennsylvania.]

WARMED, TILTING STEERING WHEEL.

A steering wheel that warms the hands of the driver in the bitterest weather is a valuable addition to any car. The wheel shown herewith contains heating units cast within the molded rim, which is made of Condensite, and the heating current required is claimed to be less than that used for a headlight. A press button switch turns the current on and off. The wheel, which is 18 inches in diameter, tilts on heavy trunnions and locks firmly in driving position, giving all the security of a solid wheel.

The Condensite rim has a corrugated edge and is molded on the aluminum spider. [Pouvailsmith Corp., Poughkeepsie, New York.]

"DICKBALATA" SOLES.

The first successful substitute for leather soles was the Dick gutta percha sole used in England for many years. It is therefore very natural that its makers should bring out a balata sole. The new "Dickbalata" soles have been tested by a council of medical men and pronounced perfectly hygienic; in fact, being entirely unaffected by rain, snow or damp, they act as safeguards to health, and retain their shape and smart appearance to the finish. The material is light, yet durable, and it is claimed that one pair of these soles will outlast three pairs of leather soles of the same thickness. Also, being machine-made articles, they are uniform in texture and free from the pain-producing ridges frequently found in the ordinary leather sole. [R. & J. Dick, Limited, Glasgow, Scotland.]

"GRIPTITE" FLAG HOLDER WITH RUBBER CUSHIONS.

Patriotic emblems are naturally prevalent in these times, and few automobiles are without their insignia of unhyphenated Americanism. A holder which will maintain a flag in an upright position on the front of the radiator of any car has corrugated, heat-proof rubber cushions which rest against the front and back of the radiator and can be easily and quickly attached without the use of tools or clamps. The "Griptite" flag holder is made of polished brass, finished in nickel or black, as preferred, and is fastened in position by a small thumb nut. [Bon Tour Manufacturing Co., Cobleskill, New York.]

HIPRESS RUBBER.

Every year there is an increase in the number of people who are discarding rubber boots and wearing, instead, perfections with laced leather tops. A sample of recent design in this line is the Hipress Ribber for mountaineers, lumbermen, and for heavy work in rough countries. This is a heavy rubber in perfection style with ribs extending the full length of the vamp. The top is of waterproof grain leather with a bellows tongue, large eyelets and hooks and a leather lacing. [The B. F. Goodrich Co., Akron, Ohio.]

ELLIS 4 IN 1 RUBBER STAMP.

The Ellis 4 in 1 stamp, as its name indicates, comprises four distinct uses within the one article. It has a revolving bar which will take a die 3/16 by 1 inch, suitable for any desired word, the words regularly supplied by the manufacturer being "Paid," "Received," "Answered," and "Entered," in molded rubber lettering. The bar can be revolved by pressing the spring inward and turning the small knob on the outside of the frame. The customary revolving dating device with raised lettering on rubber strips, imprints the date just below the word desired. The body of this convenient office accessory is made of nickel-plated steel with a black enameled handle. [Ellis Time Stamp Co., 229-231 West Illinois street, Chicago, Illinois.]

LUNG MOTOR WITH OXYGEN GENERATOR.

This complete respiratory outfit, consisting of a lung motor and oxygen generator, is claimed to be simple in operation and exceptionally valuable for use in cases of poisoning from gases and fumes, mining accidents, electric shock, apparent drowning, smoke strangulation, collapse after anesthesia, asphyxia of the new-born, etc. The hose and pneumatic face pad of the metal lung motor are provided with rubber tips, and a rubber esophagus tube is used to prevent air from entering the stomach. The metal face mask attached to the tubing has a soft rubber covering to go over the face and nose. [Life Saving Devices Co., 180 North Market street, Chicago, Illinois.]

HOWARD'S IDEAL BATHING CAP.

The primary purpose of bathing caps, namely, to keep the hair dry, is claimed to be achieved in an unusually successful manner in the cap shown herewith, by means of a peculiar form of construction. This cap is made of pure gum, with tapered instead of the customary square-cut sides. It is meeting with

approval among professional swimmers and divers, as well as those frequenting swimming pools and the seashore for pleasure only, since it affords complete protection for the hair and may be worn under any form of fancy silk cap, if desired. [The Ohio Rubber Co., 228-230 W. Seventh street, Cincinnati, Ohio.]

THE HANDY RUBBER BAND

Advice to anglers is given by "All Outdoors" to the following effect:

A half dozen rubber bands are handy things to have with you when you start out to whip a stream and leave your rod case behind. The bands are easily carried and serve nicely to hold your rod joints together when your day's sport is over and the rod is taken apart. String does not answer the purpose as well, and a case is in the way. You certainly need something to hold the joints together if you have any walking to do, unless you wish to have them spreading out and calling for your constant attention.

THE "J. T." WIND-SHIELD CLEANER.

In the wind-shield cleaner shown in the accompanying illustration the familiar "squeegee" principle is utilized. A strip of rubber is mounted on an arm which is connected through a pivotal joint with a similar arm, or handle, on the driver's side of the shield. To clean the wind-shield the rubber is moved about in a

circular direction by means of the handle. This handy accessory is supplied in three styles, shown herewith, two having removable rear arms, so that attachment can be made through the glass or the wind-shield frame, respectively, and the third being provided

with a spring clip at the pivot joint to be sprung over the frame. These cleaners are easy to apply and present a good appearance on the car. [The J. T. Auto Devices Co., 3535 Euclid avenue, Cleveland, Ohio.]

THE "LEGAL" DATER.

The new dater here illustrated is designed to combine a variety of uses with compactness of form. It is a self-contained type dating device that can be carried in the pocket, and includes all the elements of self-inking and type changing, thus facilitating its application at all places and under any conditions.

The die is mounted on a round, molded rubber air cushion arranged with mortise for the standard size date. The dates themselves are arranged in a grooved cylindrical block which forms the core of the case, the other side of the block being recessed to carry a tube of ink and a pair of tweezers. The inking pad, which is in constant contact with the printing die when the

stamp is closed, is contained in the cover or cap; simply removing this makes the stamp ready to print.

A special modern feature is the provision for cancellation of revenue stamps. [The R. H. Smith Manufacturing Co., Springfield, Massachusetts.]

SELF-DRAINING SOFT RUBBER SYRINGE.

This self-draining syringe is complete, sanitary and simple in operation. It is hand-made, of thick, soft red rubber with a highly polished finish. There are no water valves nor other metal parts to corrode, and no hard rubber attachments. The inflatable envelope surrounding the nozzle acts as an adjustable guard, preventing injected fluid from escaping.

By means of a small inflating bulb, provided with the syringe, the envelope is easily inflated to the required size, and this inflatable feature conforms the nozzle into a vaginal dilator of value to

physicians in surgical use, etc. [The Ideal Rubber Co., Los Angeles, California.]

The Editor's Book Table.

ANNUAL CHEMICAL DIRECTORY OF THE UNITED STATES.
 Edited by B. F. Lovelace. Williams & Wilkins, Baltimore, Maryland.
 [Octavo, cloth, 305 pages. Price \$5, postpaid.]

THIS, the first issue of the Annual Chemical Directory of the United States, makes its appearance at a peculiarly opportune time, when the importance of the chemical industry is realized as never before, and when this industry in America is manifesting a progressive spirit of accomplishment which it has never known before. The scope of the volume is comprehensive, the contents accurate, and the arrangement such as to render the desired address almost instantly available. It may well find a place in the office of every business in which chemistry in any form plays a part, for its twelve sections contain a great fund of helpful information. To the purchasing agent of a rubber factory it is invaluable. Whether it be desired to buy chemicals or laboratory equipment, to employ a professional chemist, to consult laboratories, colleges, experiment stations, Federal or State officials, to cooperate with chemical societies, or refer to chemical publications, the necessary individual or firm name will be found under the proper heading. All listings have been made gratis and without regard to the advertising. Each section is alphabetically arranged throughout; first by subheads, then by states and finally by names.

Chemists are classified as consulting, analytical, and chemical engineers; laboratories, as Federal and State, municipal, industrial and professional. There are lists of American and foreign colleges offering courses in chemistry, experiment stations, technical and scientific societies, chemical journals and important books of 1916-1917. The survey of 1916 devotes some space to the development of synthetic rubber in Germany, which can now be produced at \$1 per pound, estimated on the basis of the prices of raw materials in August, 1914. Among the newer devices and methods are mentioned a new double-bladed rubber masticator, a new non-corrosive insulating material, and the use of Bakelite in the making of pulleys and noiseless gears.

LES CHOLESTEROLS AU POINT DE VUE SCIENTIFIQUE ET Industriel. By André Duboscq, 49 Rue des Vinaigriers, Paris, France.
 [Octavo, 102 pages, paper. Price, 26 francs.]

This booklet consists of a collection of articles and experiments concerning cholesterol, which originally appeared in our esteemed French contemporary, "Le Caoutchouc & la Gutta-Percha." The author has treated, with his usual regard for detail and completeness in experiments, observations and tables, such subjects as: Presence of cholesterol in greases and resins of rubber; proportion of cholesterol in the acetone extracts of rubber; analysis; chemical, physical and physiological properties; physical and chemical structure, and ethers of cholesterol.

RUBBER COMPANIES' ACCOUNTS. FOR PRODUCING AND NON-Producing Companies. By R. S. Stewart, C. A., and F. C. Ebbels, with a preface by Herbert Wright, A.R.C.S., F.L.S., Gee & Co., London, England. [8vo, 128 pages, cloth. Price, 7s. 6d., postpaid.]

Plantation accounting is a comprehensive and intricate matter because of the great amount of detail required for monthly reports from the manager on the estate to the directors of the company in England, America or elsewhere, and this is the first book yet published on the subject. The authors have made an exhaustive study of the systems of leading companies and in the light of their own extensive experience have combined the best ideas into a seemingly adequate and nearly ideal system which will tend toward more sound financial methods in the management both on estates and in company offices. An industry involving a capital of nearly \$500,000,000 and 1,500,000 planted acres certainly offers opportunities for standardized accounting, and with that in view suggestions are solicited with the idea of extending the scope of the book at some later date.

OFFICIAL BULLETIN. E. S. ROCHESTER, EDITOR, 10 JACKSON Place, Washington, D. C. [8 pages. Price, \$5 a year.]

For the purpose of circulating authoritative news pertaining to government activities and the conduct of the war, "The Official Bulletin" has made its appearance and henceforth will be published daily under order of the President by the Committee on Public Information. This committee is composed of the Secretary of State, the Secretary of War, the Secretary of the Navy and George Creel as civilian chairman. E. S. Rochester is editor. The early issues consist chiefly of proclamations and executive orders of the President and stimulating publicity relative to the "Liberty Loan" and army and navy enlistments. Copies of this 8-page, 3-column newspaper will be furnished without charge to newspapers, all post offices in the United States, public officials and agencies of a public or semi-public character equipped for the dissemination of official news of the United States Government. To others the subscription rates by mail are \$5 a year.

NEW RUBBER JOURNALS.

NOTWITHSTANDING the high cost of living and the higher cost of paper, inks and printing throughout the world, not to mention the threat of almost prohibitive American postal rates proposed in the new war tariff bill, there seems to be no lack of courage on the part of those eager to enlighten the rubber trade, as shown by the following announcements.

ARCHIEF VOOR DE RUBBERCULTUUR IN NEDERLANDSCH-INDIE.

Under the above title (Archives of the Rubber Plantation Industry in the Netherlands Indies), and in the form of a monthly magazine $7\frac{1}{2}$ by $10\frac{1}{2}$ inches, will be published the reports of the Java rubber experimental stations at Buitenzorg, Salatiga, Malang and Djember, and the Sumatra station at Medan, which have formerly appeared as various bulletins and pamphlets. These will be issued in Dutch as before, but accompanied by extensive summaries and complete tabular matter in English. Book reviews and abstracts from the rubber journals of the world will be in Dutch only. This important innovation commends itself to British and American readers because the committee of editors, composed of the directors and officers of the experimental stations, consists of such well-known scientists as K. Gorter, J. G. Fol, F. C. van Heurn, H. C. Pratt, W. Roepke, A. A. L. Rutgers, A. J. Ultée, O. E. de Vries, Th. Wurth and H. J. Hellendoorn, Buitenzorg, Java, as Editor-Secretary. The features of the first issue, dated February, 1917, consist of four articles by Dr. O. de Vries, as follows: "Sugar as a Coagulant for Crêpe Rubber," "Influence of Rolling on Crêpe Rubber," "The Influence of the Rubber Content of Latex on the Inner Qualities of the Rubber," and the "Influence of the Amount of Acetic Acid on the Inner Qualities of the Rubber."

"THE RUBBER AGE."

Under this comprehensive title a new American rubber trade journal, edited by Herbert M. Williams, is being published by the Gardner, Moffat Co., Inc., New York City. It appears semi-monthly at a subscription price of \$1 a year, its announced main purpose being "to assist in spreading such known technical information as can be obtained from the laboratories and factories, as well as from the technical and engineering press," in the belief "that a better and broader knowledge of the business and commercial problems and market conditions, will be of service to both the manufacturers and those to whom they sell, and will bring about better understandings and more mutual cooperation." The first issue, dated March 26, consists of 48 pages about equally divided between reading matter and advertising, and includes four feature articles, news of interest to the Amer-

ican rubber industry, and several market departments, that devoted to manufactured rubber goods being an original conception.

INDUSTRIAL NEWS SURVEY.

Busy men will welcome the "Industrial News Survey," now being published weekly by the National Industrial Conference Board, 15 Beacon street, Boston, Massachusetts, an organization consisting of 16 trade associations of employers, including The Rubber Association of America, Inc. The news which every executive in the industrial world wants to know is presented in crisp, concise form and printed on several single leaflets, 5½ by 8½ inches, wire-stitched together. The regular subscription price is \$2 a year, but it may be procured by members through The Rubber Association of America for \$1 a year postpaid, which barely covers the cost of production and mailing.

NEW TRADE PUBLICATIONS.

THE Link-Belt Co., Chicago, Illinois, is noted for the beauty and usefulness of its various catalogs and trade publications. Several attractive pamphlets recently received are: "Traveling Water Screen for Condenser Intakes," "Increasing Profits by Saving Expense in the Handling and Storing of Coal and Ashes," "Some Modern Coal Tipples," "Blue Diamond Coal Company's Tipple," Link-Belt and Sprocket Wheels for Saw-mills," "Link-Belt Wagon and Truck Loaders," and "Cement Mill Equipment." Each of these booklets carries a message of interest to manufacturers and we understand that the company will send copies of any or all of them to those who may write to the concern requesting them. An elaborate work and a book well worthy of being in every engineer's library is the "Link-Belt Silent Chain Data Book No. 125," numbering 128 pages and handsomely bound in imitation leather. It is profusely illustrated and gives figures and tables of matters pertaining to the various belts manufactured by this company, their requirements, horse power, etc. The belts are fully described and pictured, directions given for selecting, determining length of chain and for installing and starting. The tables of transmission of horse power are particularly valuable. This company has also published as a hanger in the national colors, a portion of President Wilson's proclamation in such large type that "he who runs may read." It is a handsome and appropriate hanger for a business office. We are informed that the company will send a copy of this to anyone who may address a request to the Chicago plant.

* * *

The Westinghouse Electric & Manufacturing Co., of East Pittsburgh, Pennsylvania, has had printed in an attractive 16-page pamphlet, under the title "A Plea for Defense of Human Rights and Liberty," the memorable address of President Wilson before Congress on April 2, 1917, in which he advised a declaration of war against Germany.

* * *

A very highly colored and striking hanger issued by the Kansas City Tire & Rubber Corp., Kansas City, Missouri, to advertise its Bull tires, represents a formidable and ferocious bull charging one of these tires which, however, shows no damage from the onslaught. The hanger is one which would certainly attract attention when placed in any garage or store which may be favored with this brilliant advertisement.

* * *

The Pirelli General Cable Works, Limited, London, England, has sent out a handsome booklet describing and picturing the new Southampton works of that company. The 28 pages of fine coated paper contain many excellent half-tones of the works, one showing the main buildings in a group on the waterfront, while other pictures show details of the several buildings and interior views of the various departments. All of these are described

clearly but briefly, and at the end are views of the various factories of Pirelli & Co. in Italy and Spain, and on another page some of the plants of the General Electric Co., Limited, in England, both of which companies combine to form the Pirelli General Cable Works of Southampton and London.

* * *

The Dunlop Tire & Rubber Goods Co., Limited, of Toronto, is sending out an excellent catalog of its automobile tires and sundries. This is generously illustrated with half-tones of the tires, treads, tubes and sundries which have made the name of Dunlop famous. Each article is pictured and described, and the 40-page booklet is a fine specimen of trade catalog printing.

A TRAVELING EDUCATIONAL DISPLAY.

The Kaufman Rubber Co., Kitchener, Ontario, is now maintaining a unique window display service. Trunks are fitted with all of the equipment for dressing a window, including crude rubber and rubbers in the different stages of manufacture. This trunk is sent out to the retailer for his use and when through he repacks and returns it to the nearest branch. The trunks contain besides crude rubber, strips of soling, the various pieces, and all materials used in the process of making tennis shoes and rubbers. The company has found that merchants appreciate this service and use it to good advantage.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[294.] A correspondent is in the market for a 6 by 12-inch experimental mixing mill.

[295.] An inquiry has been received for names of concerns manufacturing hard-rubber-lined iron pipe and fittings.

[296.] Names of manufacturers of machines for cutting eyelets in outside blow-out patches are requested.

[297.] Information is sought concerning the sort of wire cloth used in straining latex in the Far East.

[298.] The address of the selling agents of Ocotillo gum is desired.

[299.] Names and addresses of manufacturers of rotary rubber scrap cutters have been requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A merchant in France is in the market for gold stylographic and fountain pens. Report No. 24,298.

An agency for the sale of rubber is desired by a company in Sumatra. Report No. 24,388.

A firm in India wishes to secure an agency for the sale of rubber goods and rubber tires for carriages and motor cars. Report No. 24,408.

An applicant in the Straits Settlements desires to purchase bare fabric automobile tires, without the rubber tread. Report No. 24,427.

A firm in England is in the market for india rubber buttons for use in making garters. Report No. 24,504.

A man in Brazil wishes to purchase three or four 12-screw rubber diving suits. Report No. 24,530.

Rubber wheels and other rubber goods are desired by an applicant in France. Report No. 24,535.

The Norwalk Tire & Rubber Co., Norwalk, Connecticut, advertises its tires in Los Angeles, California, by a unique method. A trained goose parades the streets of the city, garbed in suitably labeled attire.

The Obituary Record.

A PROMINENT PLANTATION ADVOCATE.

SIR ALEXANDER SHARP BETHUNE, who died in England recently, was a pioneer of the rubber planting industry in Ceylon. Starting in the tea planting business at the early age of 20 years, he was connected with some of the large tea plantations and was prominent as a planter from 1880 until about the first of the present century, when he left Ceylon to become a partner with Messrs. Charles Hope & Co., of London. He identified himself with a large number of planting enterprises and when

SIR ALEXANDER SHARP BETHUNE

rubber became prominent he became promoter for several leading planting companies. He was a member of the Rubber Growers' Association and, for a period, its chairman, in which capacity he was largely instrumental in the dispatch of chemists to study scientific questions on the spot. He was an earnest advocate for the standardization of rubber. For many years he was London correspondent for the "Times of Ceylon" and a few years ago he took an extended business trip which not only included Ceylon but East Africa, investigating the extraction of latex of the *Funtumia elastica* and later writing interestingly of his trip from the rubber man's standpoint, for the above mentioned journal. The story of his claim to the baronetcy is a romantic one. Mr. Alexander Bethune, by authority of the Lyon King of Arms, becoming Sir Alexander Sharp Bethune, Bart., in December, 1916. At the time of his death he was a director in a large number of tea and rubber plantation companies. He had a large circle of friends, in both England and Ceylon, who mourn his loss.

A LIFE LONG RUBBER SPECIALIST.

Terrence McCarty, for nearly 50 years connected with the rubber footwear industry, died in Providence, Rhode Island, on May 4, following a surgical operation.

He was born in Bristol, Rhode Island, March 19, 1856. His education was limited principally to the evening schools of that town, for he went to work in a cotton factory when eleven years old. He entered the employ of the National India Rubber Co. as errand boy in 1868, and worked his way up, becoming superintendent in 1893. Always ambitious, he resigned that position two years later, and, with Fred L. Smith, started the Byfield Rubber Co., which was sold to the United States Rubber Co. some years

later. In 1905 he formed the Consumers' Rubber Co. to manufacture insulated wire. Financial troubles overtook this concern in 1911. In 1914 he organized the Narragansett Rubber Co., which is in successful operation, manufacturing rubber footwear and tennis shoes, and of which he was president and treasurer at the time of his death. As an inventor he secured a patent for an ingenious and practical buckle for overshoes.

Mr. McCarty was described by his friends as a "rough diamond." That is, his education did not go far beyond that of rubber manufacture, which he knew from the wash-room up. He was warm-hearted, enthusiastic, a great worker, and a loyal, dependable friend. His wife died several years ago, but he is survived by two daughters and nine grandchildren, a brother and two sisters.

A GRANDSON OF CHARLES GOODYEAR.

Nelson Goodyear, grandson of Charles Goodyear, the discoverer of vulcanization, died at his home in New York City, after a very short illness, aged 44 years.

He was born in Brooklyn, New York, but his early boyhood was spent in the vicinity of Boston, Massachusetts, and his education received at Hill School, Pottstown, Pennsylvania, the Metropolitan School of Fine Arts, New York City, and in Paris. Like his ancestors, he was an investigator and inventor. His father created the welt sewing machine, which revolutionized shoe manufacturing. Nelson Good-

TERRENCE McCARTY

year's studies were in the lines of architecture, engineering and the development of acetylene for lighting and mechanical work. His automatic buoys are used by the United States Government, among them a 13-ton lighting and whistling buoy at the Panama Canal. He perfected acetylene and oxygen welding and cutting equipment, also apparatus for lighting and projection by acetylene. In architecture his most notable work is the wonderful dome of Columbia University, the only self-sustaining masonry dome in America. His last work was on a trench gun on original lines, a patent for which is now pending in Washington.

He traveled extensively, visiting Egypt, Athens and Rome with his uncle, Prof. W. H. Goodyear, Curator of Fine Arts at Brooklyn Institute. In Italy and France he studied architecture,

Paul Fournier Photo.

NELSON GOODYEAR

and later in Germany he investigated gas and oxygen welding.

Mr. Goodyear was an ardent lover of the sea and an ocean voyage or one in a 30-foot yawl was equally fascinating to him. He was also a splendid horseman. In 1903 he married Katharine Goodyear who is also a grandchild of Charles Goodyear. She survives him, as do also a daughter and a son.

In many respects, Mr. Goodyear inherited the character of his grandfather; the same invincible determination, the same spirit of buoyancy and optimism, above all the genius for investigation and invention which have made the name famous for all time.

PRESIDENT OF SEVERAL CORPORATIONS.

Francis C. Van Dyk, for several years president of the Sterling Tire Corporation, Rutherford, New Jersey, died at his residence, at Paterson, New Jersey, Monday, May 21.

FRANCIS C. VAN DYK.

He was born in San Juan, Porto Rico, 80 years ago, and was brought to this country at an early age. When 13 years old he entered the dry goods store owned by his uncle at New Brunswick, New Jersey, nine years later forming a partnership with his employer, and establishing a dry goods store in Paterson. Five years later, he acquired the entire ownership of the business, which eventually developed into one of the largest and most popular

department stores in the State of New Jersey.

Mr. Van Dyk was interested in a number of outside enterprises, and in 1894 retired from the dry goods business. For several years he had been interested in the Sterling Tire Corporation, and for the last four years its president. He was also president of James Simpson & Co., silk manufacturers; president of the Laurel Grove Cemetery Co., president of the Cedar Cliff Land Co., the Broadway Land Co., and the Van Dyk Land Co.

For 45 years he was vice-president and director of the Second National Bank of Paterson, and for 25 years was president of the Board of Directors of the Paterson Orphan Asylum.

He was active in religious and church work as in his business affairs and was ruling elder of the First Presbyterian Church, member of the Board of Trustees, and at the time of his death, elder of the Church of the Redeemer.

TWO SCORE YEARS A FOOTWEAR DISTRIBUTER.

Peter Gauthier, manager of the Ottawa branch of the Miner Rubber Co., Granby, Canada, died at his home in Ottawa, April 19. For 40 years he was identified with the rubber footwear trade in Canada, and for the last 16 years at Ottawa. He was well known in the Ottawa Valley and Eastern Ontario, where he had many friends in the retail footwear trade.

ACTIVELY IDENTIFIED WITH RUBBER CEMENT MANUFACTURE.

James A. Law, president of The Eureka Cement Co., Newark, New Jersey, died April 28, at Maplewood, New Jersey, in his sixty-fifth year, of a complication of diseases.

Until the last few years he had been actively identified with the manufacture of rubber cements for the shoe, hat and leather industries, having started the business nearly 30 years ago.

He is survived by a widow and son, the latter being actively identified with the present business and its branches.

INTERESTING LETTERS FROM OUR READERS.

A PHILIPPINE RUBBER PLANTING ADVISER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I am in a position to be of practical assistance to prospective rubber planters in the Philippines, as I have had considerable plantation experience and am leaving for Mindanao soon. An Englishman, I was born in Ceylon, where my father and grandfather were planters, and my mother still has valuable tea and Para estates. My father interplanted coffee with tea and got returns from the tea in 18 months, and later my brother interplanted the tea with Para rubber, both products growing well together.

I began life as a planter, and have opened up three estates. More recently as a traveling dentist riding through the planting districts, I have established several large nurseries. I can select land and plant it with rubber and other products, which will give a quick return. As proof of my ability I enclose a testimonial from the late John Ferguson, C.M.G., a member of the legislative council in Ceylon, editor and proprietor of the "Observer," and owner of a tea estate. T. H. STEPHENS.

Cosmopolitan Building, Manila, March 16, 1917.

THE TALK IN SINGAPORE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—There is much local discussion at Singapore and in this section about American companies obtaining title to land for rubber plantations. Planters here reason that in a measure it will reduce the number of their customers when some of their former customers are producing for themselves. To further explain, it appears that the General Rubber Co. may desire to own a plantation on the peninsula in addition to its plantations in Sumatra, and it is blamed for the entire project, as it is established here better than others. Three of the big American manufacturers, it is rumored, are looking for land to light on, and one took an option on 20,000 acres, which has expired without exercising it. All this gives foundation for much discussion on the subject of the "American invasion," regarding which not an American has raised his voice nor written a line for print so far.

The actual average price the planters obtained for their 1916 rubber was three shillings per pound—a fraction more, perhaps, but I placed it at 60 cents to be sure to be conservative. This difference of some 12 cents per pound would make the aggregate of millions yet higher which Americans paid in 1916 to this part of the world.

And yet more, the most reliable information I have obtained here on the total product of rubber, was a little over 164,000 tons of plantation, which figure I think will be found later on about correct, and this would still add to the total amount in gold dollars paid by America. If the balance of the world (South America, Africa, Central America and Mexico) produced 50,000 tons in 1916, we have a grand total of 214,000 tons as the world's production for 1916.

Great Britain has passed a law, and this dependency has adopted it, taxing automobiles for every purpose and sold at any price—whether a Ford or a Pierce-Arrow—the round sum of 299 cents (Straits Settlements currency) each as a means of revenue.

The council of the government contemplates raising the tax on exported rubber from here and it will be based upon pounds-weight, quality having nothing to do with it.

Singapore, April 10, 1917.

L. E. J.

News of the American Rubber Trade.

PRESIDENT HOTCHKISS TO SUPERINTEND RUBBER PRODUCTION.

H. STUART HOTCHKISS, president of the General Rubber Co., vice-president, secretary and treasurer of The L. Candee & Co., director and member of the executive committee of the U. S. Rubber Co., and first vice-president of The Rubber Association of America, Inc., is one of a notable committee chosen by the United States Government to superintend the production of raw materials for the war. It will serve under Bernard M. Baruch, chairman of that division of the National Council of Defense. Mr. Hotchkiss is chairman of the Rubber Committee.

H. STUART HOTCHKISS

United States Steel Corporation; A. C. Bedford, head of the Standard Oil Co.; Horatio S. Rubens, director of the United States Industrial Alcohol Co., alcohol; Arthur V. Davis, aluminum; Thomas F. Manville, asbestos; Charles F. Brooker, brass; W. H. Childs, coal tar by-products; Robert H. Downman, lumber; Clinton H. Crane, lead; L. W. Kingsley, mica; Ambrose Monell, nickel; Henry Whiton, sulphur, and Jacob F. Brown, wool.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on May 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	68	72
Firestone Tire & Rubber Co., common.....	128	133
Firestone Tire & Rubber Co., preferred.....	106	108
The B. F. Goodrich Co., common.....	52	52 3/4
The B. F. Goodrich Co., preferred.....	106 1/4	107 1/2
The Goodyear Tire & Rubber Co., common.....	200	203
The Goodyear Tire & Rubber Co., preferred.....	106	108
Kelly-Springfield Tire Co., common.....	53 1/2	55
Kelly-Springfield Tire Co., preferred.....	87	94
Miller Rubber Co., common.....	196	200
Miller Rubber Co., preferred.....	104	106

Swinehart Tire & Rubber Co.....	65	70
United States Rubber Co., common.....	57 3/8	58
United States Rubber Co., preferred.....	105	106

RUBBER COMPANY DIVIDENDS.

The Republic Rubber Co. paid a quarterly dividend of 2 per cent on common stock on May 1 to stockholders of record April 25. A dividend of 1 3/4 per cent has been declared on preferred stock, payable June 1 to stockholders of record May 20.

The Ajax Rubber Co. has increased its dividend rate from \$1.25 per share to \$1.50 per share, the declared dividend at the new rate payable June 15 to stockholders of record May 31.

RUBBER SCRAP DIVISION MEETING.

The Rubber Scrap Division of the National Association of Waste Material Dealers held a very satisfactory meeting, May 15, at the Hotel Astor, New York City. The recommendations relating to packing and shipping specifications made by the Rubber Reclaimers' Division of The Rubber Association of America, Inc., were adopted with a few minor changes. The next meeting will be held June 19-20. A new circular on packing and a pamphlet on trade customs between dealers and consumers will be issued under date of July 1, 1917.

CANADIAN CONSOLIDATED ELECTIONS.

At the recent annual meeting of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, directors were elected for the current year, as follows: Walter Binmore, R. C. Colt, Col. S. P. Colt, W. A. Eden, R. E. Jamieson, V. E. Mitchell, K. C., E. W. Nesbitt, M. P., W. G. Parsons, R. B. Price, T. H. Rieder, W. H. Robinson, Homer E. Sawyer, A. D. Thornton, Elisha S. Williams.

At a subsequent meeting of the directors, the following officers were elected: T. H. Rieder, president; V. E. Mitchell, K. C., vice-president; W. A. Eden, secretary; Walter Binmore, treasurer; R. C. Colt, assistant secretary, and J. P. B. Daigneau, assistant treasurer.

UNITED STATES RUBBER CO. ESTABLISHES NEW FOOTWEAR PLANT.

The United States Rubber Co. has acquired the plant originally established as the Banner Rubber Co., at Kenrick and Bittner streets, Baden, St. Louis, Missouri, and will operate it exclusively for the manufacture of rubber footwear. Charles R. Haynes, superintendent of The Goodyear Metallic Rubber Shoe Co., at Naugatuck, Connecticut, will be in general charge of this St. Louis plant, the preliminary work being in charge of J. M. Rice, superintendent of The L. Candee & Co. plant, located at New Haven, Connecticut. It is hoped within the next six months to develop a production of at least 10,000 pairs a day of rubber shoes and arctics.

CONDENSITE PATENTS RECOGNIZED BY GENERAL BAKELITE CO.

Litigation between the Condensite Co. of America and the General Bakelite Co. has been terminated, and the General Bakelite Co. agrees to recognize the validity of the Condensite (Aylsworth) patents Nos. 1,065,495, dated June 24, 1913, and 1,137,374, dated April 27, 1915, and to pay substantial royalties thereunder.

The patents in question cover broadly all varnishes, lacquers, enamels and cements with which a phenolic condensation product (such as condensite or bakelite) is combined with a double solvent of either of the following types: first, a readily volatile organic liquid and another organic liquid immiscible with, and of a higher boiling point than water, or second, a liquid oxygen compound of the aliphatic series and a compound of the benzene series soluble therein, or a cyclic hydro-carbon.

WAGE INCREASES IN NEW YORK.

In the rubber and gutta percha establishments of New York State the number of employes was 7.9 per cent greater than in March, 1916, and their total wages were 28.7 per cent greater. The gains over February, 1917, were 1 and 7.4 per cent, respectively.

The chemical industries also reported increases in wages greater than in number of employes, the excess over March, 1916, being 11.4 per cent in number and 28.6 per cent in wages.

RUBBER SHIP CRIPPLES A U-BOAT.

BECAUSE the rubber industry is so dependent upon freedom of the seas it seems a singular coincidence that a ship in the direct London-New York service, well known for its frequent rubber cargoes, should have been the first American armed merchantman to cripple a German submarine. This distinction goes to the "Mongolia" of the Atlantic Transport Co., a vessel of 13,638 tons under the command of Captain Emery Rice. On April 19, the 142nd anniversary of the Battle of Lexington, the gun crew under Lieutenant Bruce R. Ware fired America's first shot in the war and scored a clean hit at 1,000 yards, shattering the periscope, thereby repelling the U-boat attack. On her return trip to New York the "Mongolia" was twice attacked by submarines without damage. A sister ship, the "Manchuria," is in the same service.

TRADE NOTES.

The Omaha, Nebraska, branch of the United States Rubber Co. has leased the ground at the corner of Ninth and Douglas streets, and will build there a reinforced concrete, brick-faced, fireproof building of five stories. The American Hand Sewed Shoe Co., which is a branch of the United States Rubber Co., will occupy a portion of the building.

Hagemeyer & Brunn, dealers in crude rubber, announce the removal of their offices to 82 Beaver street, New York City.

The Canadian Consolidated Rubber Co., Limited, of Toronto, sent out last month a new footwear price list, which shows an average advance of 2 to 3 cents on low rubbers, and 10 to 15 cents on boots. Lumbermen's gum and duck goods are advanced 10 cents a pair.

The Third National Exposition of Chemical Industries will be held at Grand Central Palace, New York City, the week of September 24. A large number of leading houses have already signified their intention to exhibit.

O. A. Barnard Co., dealer in fabrics for the rubber trade, has opened an office at 50 East Forty-second street, New York City.

The first of a series of suits aggregating several millions of dollars has been instituted by Ferdinand Ephraim, of San Francisco, against Salvador Madero, of Mexico, on the ground that the latter, representing large interests in Mexico, has infringed his patents for extracting rubber from the guayule plant, thereby causing Mr. Ephraim losses to the extent of \$8,000,000.

The well-known chemical and color house of J. Early Wood, New York City, is now represented on the Pacific Coast by L. T. Kirch, 461 Market street, San Francisco, California, who has been appointed sales manager for that territory.

E. M. & F. Waldo, manufacturers of compounding ingredients extensively used in rubber manufacture, have recently increased their facilities and office space, having taken a commodious suite of offices occupying the entire center section of the fourth floor of the Bowling Green Building, 11 Broadway, New York City.

The Habirshaw Electric Cable Co., New York City, has purchased property on the Saw Mill River Road, Yonkers, New York, on which it will erect a one-story brick factory building, 60 by 242 feet, to be used as a wire-drawing department, the cost being estimated at \$60,000.

The office of Ralph Croft, crude rubber broker, is now located at 72 Trinity Place, New York City.

J. A. McKenzie recently sailed for the Antipodes, as local Australasian manager for the United States Rubber Export Co., whose business there will be conducted under the name of the India Rubber Products Co., Limited. Mr. McKenzie was formerly branch manager of the Canadian Consolidated Rubber Co., Limited, at Victoria, B. C. D. F. Moncur, formerly of the Montreal office of the Canadian Consolidated company, will act as Mr. McKenzie's assistant.

JOHN J. CHANDLER.

JOHN J. CHANDLER, vice-president of the Hoggson & Pettis Manufacturing Co., New Haven, Connecticut, is a man widely known in the rubber trade, his entire business life having

JOHN J. CHANDLER.

been devoted to the engraving of rolls for rubber manufacturers. When S. J. Hoggson started as a die sinker and engraver in 1849 he had little idea of the great growth of the business he founded. Thirty years after, he took a partner, George C. Pettis, and as the business grew it was incorporated. The success of this concern in no small degree is due to John J. Chandler, who became an apprentice in June, 1880. In the following years he became one of the

most expert roll engravers in the country. He rose to the position of foreman, then superintendent, and later vice-president. In this latter capacity he has traveled extensively throughout the United States and Canada, and his face is familiar, he having attended practically all the conventions and exhibitions of the rubber trade which have been held in the past ten or fifteen years, while his work is held as a standard in leading mills both in this country and abroad.

PERSONAL MENTION.

A. Staines Manders, alert, indefatigable and far-seeing, is planning a monster rubber exhibition in London in 1919. It is sure to be a success, else he will not hold it, and in the event that the submarine is by that time eliminated, American interest, personal and present, is sure to be great.

Richard Weil, who has become the guide, counselor and friend of many visiting the great rubber plantations in the Far East, has returned from his winter's trip to Java, the Federated Malay States and Ceylon. Although but just landed, he is already making plans for a trip to the same countries next winter.

E. J. Carlin, formerly with the Pioneer Asphalt Co., Lawrenceville, Illinois, has accepted a position in the sales department of the Barber Asphalt & Paving Co., Philadelphia, Pennsylvania.

G. G. Schrieke, representative of the Java-Sumatra Syndicate, Bandoeng, Java, is in the United States with the object of interesting American capital in planting in the Far East. He will sail for Holland shortly and return to this country in September.

CORRECTION.

The May issue of THE INDIA RUBBER WORLD contained a notice to the effect that the Pioneer Asphalt Co., of Lawrenceville, Illinois, had become affiliated with another company in the same line. This was erroneous, as the Pioneer Asphalt Co. has not made any change since its incorporation, nor does it contemplate any. "Pioneer" M. R. Hydrocarbon, manufactured for the rubber trade, is a well known product of this company.

NATIONAL ASSOCIATION OF COTTON MANUFACTURERS.

At the annual meeting of this organization held at the Copley Plaza, Boston, Massachusetts, April 25 and 26, practically the whole board of government was reelected: Albert Farwell Bemis for president, Russell B. Lowe and W. Frank Shove, vice-presidents; Philip Dana and John E. Rousmaniere for full terms on the board of directors, Thomas H. Rennie for two years to succeed R. M. Miller, resigned, and William B. MacColl for one year, to succeed William N. Kimball, resigned.

All of the many important addresses, including a stereopticon lecture on "The New Cotton Fields of the Southwest," by Walter E. Packard of the University of California Agricultural Experiment Station, El Centro, California, gave indication that the leading men of this industry realize its importance during the present critical period and the imperative need of increased production of factories and farms to help sustain our burden in the European conflict. National policies affecting the war were discussed, and the association expressed itself in favor of selective conscription, daylight saving, and cultivating garden plots, outlined a plan for a fair tax levy to furnish the Government with all the money needed, and called for a firm hand on the limitation of the ultimate destination of exported American cotton. An international cotton conference was advocated to be held immediately upon the conclusion of the present war at some convenient point in the United States, and to be composed of representatives of all branches of the cotton industry in the countries with which we shall at that time enjoy reciprocal trade relations.

R. M. LOEWENTHAL & CO.

R. M. Loewenthal & Co. is the name of a recently organized waste rubber concern which will confine its operations exclusively to auto tire scrap. The head of the new company is Ralph M. Loewenthal, formerly of The Loewenthal Co. and well known in the waste rubber industry. The new company, with offices at 51 East Forty-second street and warehouse in Buffalo, New York, has a highly developed buying and sales organization.

CANADIAN DRAWBACK ON RUBBER FABRICS.

Canadian custom regulations issued under an order in council of February 6, 1917, authorize a drawback of 99 per cent of the customs duties on imported cotton fabrics which are used in the manufacture in Canada of rubber belting, rubber tires, and rubber tubes. Drawback will be allowed only when the duty has been paid not more than three years before the manufacture of the goods and cannot be claimed for a quantity of cotton fabric in excess of the quantity of similar cotton fabric used in the manufacture of rubber belting, tires, and tubes made by the claimant for drawback and exported during the period covered by the claim subsequent to January 1, 1917. Satisfactory proof must be furnished as to the manufacture and exportation of the goods on which drawback is claimed.

FLAG RAISINGS IN RHODE ISLAND.

The employees of the several rubber manufacturing plants in Rhode Island continue to show their patriotism by flag raisings and appropriate exercises, so that "Old Glory" waves triumphantly from numerous staffs and out of many windows at every rubber factory in the State. Flags are now installed in nearly every department at the Davol Rubber Co. plant. There was an elaborate flag raising on May 1 at the boiler room and box factory of the National India Rubber Co.'s plant at Bristol, and a similar flag raising at the office of the factory of the International Rubber Co., at West Barrington, early in the month.

CUTLER-HAMMER ADDS TO PLANT.

Extensive additions to the plant of The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, maker of electric con-

FIRST OF THE NEW UNITS BEING ADDED TO THE MILWAUKEE WORKS OF THE CUTLER-HAMMER MANUFACTURING CO.

trolling devices, are in progress and one of the new buildings is shown in the accompanying illustration. It is of reinforced concrete construction, fireproof throughout, six stories high and extending the length of a city block. Arrangements for daylight and artificial lighting are exceptionally well provided for and a complete air washing system will be installed.

NEW OFFICERS OF THE NARRAGANSETT RUBBER CO.

At a meeting of the stockholders and directors of the Narragansett Rubber Co., Bristol, Rhode Island, held May 17, to fill the vacancies caused by the death of the president and treasurer, Terrence McCarty, Mrs. James P. Murphy and Mrs. Florence F. Sullivan were added to the board of directors. Robert S. Emerson, of Pawtucket, was then elected president and Miss Nora Leahy, treasurer.

Robert S. Emerson, the newly elected president, is well known in the legal profession. He is a member of the law firm of Mumford, Huddy & Emerson, of Providence, Rhode Island. He graduated from Brown University in 1897, and for several years was connected with the selling department of the National India Rubber Co. In 1903 he graduated from the New York Law School, beginning the practice of law the next year. For nine years he was Clerk and Associate Justice of the Tenth District Court of Rhode Island. In 1915 he was elected Judge of the Probate Court at Pawtucket, Rhode Island, which office he now holds. He is also president of the Tilden & Thurber Corporation, of Providence. Mr. Emerson has been associated with Mr. McCarty's business since 1912, when he was appointed receiver for the Consumers' Rubber Co., of which the Narragansett Rubber Co. is the successor, and is thus well qualified to fill the office to which he has just been elected.

Miss Leahy, the new treasurer of the company, was elected secretary of the Consumers' Rubber Co. in 1906, to fill the vacancy caused by the death of Mr. McCarty's son. She is secretary of the Narragansett company and since Mr. McCarty's illness had been assistant treasurer.

TRADE NOTES.

The Twin Tube & Rubber Co., Chicago, Illinois, is preparing to manufacture a general line of rubber goods, specializing in a new type of inner tube for which many advantages are claimed. Joseph F. Davis is president of the company, A. S. Johnson, vice-president, and F. I. Chichester, secretary-treasurer.

The Consumers Rubber Co., Cleveland, Ohio, has acquired the interests and resources of The Cleveland Tire & Rubber Co., and Thomas J. Jones, who has been the directing head of the latter company, is now secretary and treasurer of The Consumers Rubber Co. B. E. Frazier is president, and J. N. Kirby, vice-president and general manager.

At the annual stockholders' meeting of the BeSaw Tire & Rubber Co., Hartville, Ohio, held May 7, the following directors were elected for the coming year: C. A. BeSaw, I. M. Putnam, D. W. BeSaw, G. F. Kline, P. P. Parker, Chas. Von Weise, Mark Kirkpatrick. The following officers were also elected: C. A. BeSaw, president; I. M. Putnam, vice-president; D. W. BeSaw, secretary and treasurer.

Three former employes of the Federal Rubber Co., Milwaukee, Wisconsin, two Austrians and an Italian, met under peculiar circumstances not long ago in Europe. Upon the outbreak of the war each returned to his native land and joined the army. The two Austrians were recently captured in battle, and among the Italian soldiers parceled off to guard them was their co-worker in America. Although nominally enemies, the meeting was a happy one, and the incident served to show how fate separates and brings people together again in real life.

The Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio, has increased its capital stock to \$750,000 by an issue of \$350,000 7-per cent cumulative preferred stock. The growth of the company's business requires the installation of additional equipment to operate the increased volume of production efficiently, and the proceeds of this issue will be used for this purpose at the factory at Willoughby, Ohio. The previous capitalization was \$400,000 in common stock.

At the last stockholders' meeting of the Gryphon Rubber & Tire Corp., New York City, the following officers and directors were elected: Norman W. Peters, president; A. E. Gordon, vice-president and general manager; S. A. Cunningham, treasurer; A. G. Vellek, secretary. Norman W. Peters, A. E. Gordon, S. A. Cunningham, Robert W. Schuette, R. M. Owen, Hicks A. Weatherbee, Dr. D. W. Whipple, Chas. W. Hunt, and Geo. Van Keuren, directors.

The Luck Tire & Manufacturing Co., Jonesville, Michigan, has increased its capital stock from \$500,000 to \$1,500,000.

The Fabricord Tire Co., which recently took over the plant of the American Case & Register Co., of Salem, Ohio, is equipping for the production of 500 tires a day. It is estimated that the factory will be in full operation by the latter part of the year.

A new rubber mill to employ between 300 and 500 men and to be located at Tarentum, Pennsylvania, is said to be projected. The promoter of the prospective plant is Milton Bejach. The new company will be capitalized at from \$500,000 to \$600,000, which will be distributed between local and eastern investors. The product will be tires and tubes.

Construction of several factory buildings is in contemplation by the new Columbus Climax Rubber Co., recently incorporated with a capital stock of \$200,000. Temporary headquarters are located in the Citizens' Bank Building, Columbus, Ohio.

The Giant Tire & Rubber Co. has outgrown its Akron plant and in order to accomplish a much needed expansion has purchased the plant of the Toledo-Findlay Tire & Rubber Co., at Findlay, Ohio. The machinery in the Akron plant will be taken to Findlay and utilized as well as that purchased with the new plant. Twenty skilled workmen and foremen will be sent from

Akron to Findlay, approximately 50 men in all being employed at first, with a gradual increase. The company will enter upon the manufacture of automobile tires at once, and a little later on will manufacture inner tubes and a general line of rubber goods. The capital stock has been increased to \$150,000. The purchase price of the Findlay plant was \$25,000.

The Meyer Rubber Co., Massillon, Ohio, is turning out a line of automobile tires in all standard sizes. Frank Ridge, formerly of the Firestone Tire & Rubber Co., and more recently of the Marathon Rubber Co., is superintendent of the new plant. The officers are, Fred W. Hatchel, president; A. A. Walter, vice-president; W. E. Evans, treasurer; W. S. Lynch, assistant treasurer, and R. J. Hatchel, secretary.

The Anderson Steam Vulcanizer Co., maker of the Anderson steam vulcanizer, has recently qualified to do business in Indiana, its agent being Newton M. Anderson, Worthington, Indiana, also president, treasurer and director of the company. W. D. Schwarting, of Dayton, Ohio, is secretary. This firm was incorporated under the laws of the State of Ohio, September 19, 1916, with a capital stock of \$100,000 and an office at Cincinnati, Ohio. The factory is located at Worthington, Indiana, and all business is transacted from that point.

The Good-Wear Rubber Co., Elyria, Ohio, manufacturer of automobile tires and tubes, has changed its name to The Long-Wear Rubber Co.

The A. J. Stephens Rubber Co., successor to the McFall Rubber & Manufacturing Co., Kansas City, Missouri, whose plant was destroyed by fire on April 12, has opened up at 1318-26 Chestnut avenue, having purchased 150 feet fronting on Chestnut avenue. The new company manufactures tire accessories—inside blow-out patches, outside boots, reliners, patching material, cements and fan belts. Eighty persons are now employed and the number will soon be increased to over 100. A. J. Stephens is sole owner and manager.

The Dayton Rubber Manufacturing Co., manufacturer of airless and pneumatic automobile tires, will display its products in the permanent Dayton Manufacturers' Exhibit being established by The Greater Dayton Association at Dayton, Ohio.

KILLINGLY IS NOW GOODYEAR.

It is particularly appropriate that Connecticut, the state where Charles Goodyear was born, and where many of his experiments were performed, should have a post office bearing his name, and such has now become the official designation of the manufacturing town formerly known as Williamsville and later as Killingly. The cotton mills of the Goodyear Tire & Rubber Co. are in this village, and undoubtedly it was because of this fact that the name has been changed to Goodyear. The company has in successful operation there a large plant for the manufacture of tire fabrics, and this plant is to be enlarged by the erection of several new buildings, among them a storehouse with a capacity of 10,000 bales of cotton, and upon completion of the present building operations the mills will have a capacity of more than 150,000 pounds of tire fabrics weekly.

UNDERWRITERS' LABORATORIES IN NEW QUARTERS.

On May 1 the New York office and testing station of Underwriters' Laboratories was removed to the twelfth floor of the Evening Mail Building, 25 City Hall Place, in order to provide increased space and better facilities for the conduct of their work.

The new building of the Plymouth Rubber Co., at Canton, Massachusetts, is nearly completed, and it is expected that it will be in condition to commence manufacturing early next month.

ARTHUR E. FRISWELL.

ARTHUR E. FRISWELL, tire expert, was born in Coventry, England, in 1870. He was brought to this country at the age of 14 by his father, the late E. D. Friswell, who became a

A. E. FRISWELL.

partner in the Bridgeport Elastic Web Co., Bridgeport, Connecticut. After a term of school in Bridgeport he went to the Revere Rubber Co., Boston, Massachusetts, working under the late James Leigh. He worked there for eight years during which period the pneumatic tire came into existence. After becoming foreman of the Revere Rubber Co.'s first tire department he assumed charge of the tire department of the Mechanical Fabric Co.,

Providence, Rhode Island, which was then an offshoot of the firm of David Moseley & Sons, Limited, Manchester, England, making thread for the Bridgeport Elastic Web Co., and tires for the Dunlop company in America. Mr. Friswell spent a further eight years building up the tire department of the Mechanical Fabric Co. Then that department became merged in the Rubber Goods Manufacturing Co. and was shifted to Hartford, Connecticut, where he went as assistant superintendent of the Hartford Rubber Works Co. During four years there Mr. Friswell saw the pneumatic bicycle tire begin to expand into the motor tire, and contributed towards its success.

Deciding that a bit of the world not bounded by rubber and with latitude and longitude not defined by the pneumatic tire might enlarge his horizon, he started for a world tour with letters of introduction to all the leading tire makers in Europe, and some of the then infant plantations; but he did not get very far. His technical knowledge was wanted by Messrs. Moseley, in Manchester, England, and they got it. For almost four years he, as manager of the tire department, fought an up-hill battle in a country of free imports against all comers, foreign and domestic.

His father's death compelled his return to America where, for a time, he was soon engaged by the Goodyear Tire & Rubber Co., Akron, Ohio. Feeling entitled to a rest, Mr. Friswell then took it on his bungalow estate in Bermuda, where his wife was born. But, as he says, a man's work is part of the fabric of his life. He has, therefore, been back to England for two years, doing special work in rubber, and now, that work being finished, he is again in America with an important tire connection.

BRIGHT PROSPECTS FOR SEBRING TIRE COMPANY.

At a special meeting of stockholders of the Sebring Tire & Rubber Co., Sebring, Ohio, held May 10, it was voted to increase the capital stock from \$200,000 to \$500,000, and a stock dividend of 25 per cent. to present stockholders was declared. Bright prospects were reported and the production is to be immediately increased to 200 tires per day. E. H. Trump, maker of the original "Quality Tire" at Hartville, Ohio, is the practical man in the concern and J. S. Hotchkiss is general manager.

PERSONAL MENTION.

J. Wilbur Hobbs has been placed in charge of the New York City branch of the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, which has been moved from 1966 Broadway to 236 West Fifty-fourth street.

L. W. Kennedy has been appointed special truck tire representative for the United States Rubber Co., in the Southern district, with headquarters at Atlanta, Georgia.

Fred L. Gayton, formerly with the Goodyear Tire & Rubber Co., has now joined the New York City forces of the United States Rubber Co.

Theodore F. MacManus, of Detroit, Michigan, has been retained by the Republic Rubber Co., Youngstown, Ohio, as advertising and business counsel for the extensive advertising campaign of the company's Prodiun Process tires.

Herman Ditt, formerly of Detroit, Michigan, has been appointed superintendent of the Lion Tire & Rubber Co., Lafayette, Indiana.

J. R. Cheshire succeeds R. J. Murphy as manager of the Atlanta, Georgia, branch of The B. F. Goodrich Co., Mr. Murphy having entered the automobile business as distributor for Oakland motor cars.

George A. Richards has been appointed special representative for the manufacturers' sales department of the Firestone Tire & Rubber Co. in the Detroit, Michigan, territory. Mr. Richards has been connected with the sales department of the company for several years, during the past three years occupying positions as branch manager at Columbus, Ohio, and Pittsburgh, Pennsylvania.

S. A. E. SUMMER MEETING.

Plans for the summer meeting of the Society of Automotive Engineers to be held at the Bureau of Standards in Washington, D. C., June 25-26, are now fully completed. On Tuesday war airplanes will be considered. Wing Commander I. W. Sedden, R. N. A. S., and Major Reese, of the British Commission in this country, will read papers and answer questions on this subject. Motor trucks, farm tractors and motor boats will be considered by men prominent in these branches. A professional session will be held at the Bureau of Standards and the various departments of the Bureau will be open to inspection of the members on Monday, the 25th, when special demonstrations of testing materials, etc., will be shown. An informal dinner will be held at the New Willard Hotel Tuesday evening, June 26, at which Secretary of War Newton Baker will make the principal address, and there will be other speakers. Over 30 guests representing the Army and Navy will be present, in addition to the Council of National Defense and other organizations now cooperating with the Government. It is expected that more than 800 members will attend this meeting and dinner. At the last meeting of the council 227 new members were admitted.

THE GOODYEAR TIRE & RUBBER CO. PROMOTIONS.

C. M. McCreery, formerly assistant manager of the Chicago, Illinois, district, has been made special manufacturers' representative for the same district, G. H. Barmore being transferred from Milwaukee, Wisconsin, to fill the vacancy. A. J. Sears, formerly branch manager at Sioux City, Iowa, succeeds Mr. Barmore as branch manager at Milwaukee, and W. A. Ziegler, formerly city salesman at Milwaukee, has been made branch manager at Sioux City.

W. S. Boone, formerly supervisor of city sales in Philadelphia, Pennsylvania, is now special manufacturers' representative for the New York district.

NEW INCORPORATIONS.

Akron Equipment Co., The, March 28 (Ohio), \$125,000. The officers of the company with the exception of C. D. Quine, general manager, are only temporary. Temporary location, 923-27 South High street, Akron, Ohio. To manufacture tire molds and tire repair equipment.

American Detachable Rubber Heel Corp., May 16 (Delaware), \$1,000,000. Herbert E. Latter, C. L. Rimlinger—both of Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. The office of the corporation within the State of Delaware is with the Corporation Trust Co. of America, 486 Dupont Building, Wilmington, Delaware. To manufacture, buy, sell and deal in leather and leather goods, rubber and rubber goods of every kind.

American Nipple Co., May 16 (New Jersey), \$100,000. Charles B. Hermans, Aloysius McMahon, and James J. McCabe, all of No. 1 Montgomery street, Jersey City, New Jersey. Principal office at the above address. To manufacture, purchase and sell rubber nipples, rubber sundries and all goods of which rubber is a component part, etc.

Auto Vulcanizer & Specialty Co., April 26 (Delaware), \$50,000. Wilber A. McCoy, Pittsburgh, Pennsylvania; W. I. N. Lofland, and Charles H. Jones—both of Dover, Delaware. The office of the corporation within the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture and sell the Automatic Steam Vulcanizer for vulcanizing rubber tires, and to deal in automobile accessories of all kinds.

Bachem-Robinson Co., Inc., The, March 15 (Michigan), \$30,000. Maxmillian Bachem (president and general manager), 1117 Woodward avenue; Weldon Robinson (secretary and treasurer), 54 Edison avenue—both in Detroit, Michigan. Principal office in Detroit, Michigan. To manufacture and deal in equipment for automobiles, airplanes, motor-cycles, etc.

Barnett S., Inc., April 5 (New Jersey), \$3,000. Samuel Barnett, 407 Bloomfield street, Hoboken, New Jersey; Louis Barnett, 1355 Sixtieth street, Brooklyn, New York; Jacob Barnett, of the same address. Principal office at 407 Bloomfield street, Hoboken, New Jersey. To sell, purchase and deal in all kinds of old and new metals, rubber of every description and kind, etc.

Carlisle Cord Tire Co., Inc., May 7 (New York), \$550,000. Frank R. Serles, East Orange, George F. Hadel, Montclair—both in New Jersey; Henry G. Wenzel, Jr., Woodhaven, New York. To manufacture automobile tires, etc.

Chinnock Tire & Rubber Corp., The, May 5 (Delaware), \$250,000. Cornelius A. Cole, Hackensack, New Jersey; Arthur R. Oakley, Pearl River, Paul E. Britsch, 1528 Bedford avenue, Brooklyn—both in New York. The office of the corporation within the State of Delaware is with the Registrar & Transfer Co., 900 Market street, Wilmington, Delaware. To manufacture and generally deal in tires for automobiles, bicycles, carriages and vehicles of all kinds.

Constable Tire & Rubber Co., May 17 (New York), \$100,000. George J. Constable, 1805 Avenue J., Robert S. Hoffman, 2023 Caton avenue, and Henri Pressprich, 256 Seventy-ninth street—all in Brooklyn, New York. Dealers in auto tires, tubes and accessories.

Diamond Rubber Co., Inc., The, April 25 (New York), \$200,000. H. E. Raymond and Norman E. Oliver—both of 1780 Broadway, New York City, and Frank C. Van Cleef, Main street, Akron, Ohio. Principal office at 1780 Broadway, New York City. To sell rubber goods for the most part consisting of "Diamond Brands," manufactured by The B. F. Goodrich Co., Akron, Ohio.

Dominion Asbestos & Rubber Corp., May 10 (New York), \$20,000. Allen E. Moore, 20 Arden street, George F. Jebbett, 120 Sherman avenue—both in New York City; F. H. Butehorn, 764 St. Johns Place, Brooklyn, New York. Packing, rubber, asbestos, and insulating materials.

Double Action Tire Pump Co., April 13 (Virginia), \$50,000. J. B. Ford (president), R. G. Leftwich (vice-president), A. T. Henderson (secretary and treasurer), J. B. Ford, J. B. Bowles, R. D. Hughes, R. G. Leftwich, A. T. Henderson (directors)—all of Lynchburg, Virginia. To manufacture pumps, machinery, etc.

Dunlop Rubber Co., Inc., May 22 (New York), \$1,000. Otto Braunwarth, L. A. Braunwarth and Albert Braunwarth—all of 1808 Broadway, New York City. To manufacture tires, etc.

Dunn, John H., Tire Co., March 30 (Texas), \$10,000. John H. Dunn, A. M. Rhodes, and Will E. Looney—all of Dallas, Texas. To sell goods, wares and merchandise, particularly automobile tires and accessories.

Flexenham Insulating Co., Inc., May 19 (New York), \$250,000. Judson Lawrence, Geo. E. Packard and Edgar T. Chapman—all of Albany, New York.

Hoover Tire Carrier Corp., April 24 (Delaware), \$200,000. M. L. Gatchell, L. A. Irwin, and Harry W. Davis—all of Wilmington, Delaware. The office of the corporation within the State of Delaware is with the Delaware Registration Trust Co., 500 Market street, Wilmington, Delaware. To manufacture any and all kinds of generators, motors, engines and other machinery.

Hoover Tire Carrier Corp. of New York, May 2 (New York), \$10,000. Arthur D. Hayden, 121 East Twenty-first street, Hiram Barney, 55 West Forty-fourth street, and Don C. Bartholomew, 895 West End avenue, all of New York City. General manufacturing business.

Ideal Tire & Rubber Co., The, April 25 (Ohio), \$1,000,000. Eli Cannell (president), I. R. Davies (treasurer), A. S. Davies (secretary), B. E. Frantz (superintendent), Geo. H. Burrows, E. Scott Cannell, A. Klohs and C. B. Hurd (directors). Principal office, 326 Guardian Building, Cleveland, Ohio. To manufacture tires and tubes.

Loughman, Thomas, Inc., May 4 (New York), \$10,000. Thomas Loughman (president and treasurer), 530 West End avenue, A. E. Beckert (secretary), 468 Riverside Drive—both in New York City. Principal office 1791 Broadway, New York City. Distributors of Dreadnaught automobile tires and tubes.

Loewenthal & Co., R. M., May 14 (New York), \$200,000. R. M. Loewenthal, 260 Riverside Drive; J. M. Detjen, 61 Broadway—both in New York City, and R. D. Ottignon, 261 Greene avenue, Brooklyn, New York. Principal office is at 51 East Forty-second street, New York City. Dealers in rubber, metals, etc.

Manufacturers Surplus Tire Co., Inc., May 5 (New York), \$500. Adolph Bangser, Joseph T. Mulligan and Louise Stern—all at 55 Liberty street, New City. To manufacture auto accessories, etc.

Michigan Tire & Accessories Co., March 27 (Michigan), \$100,000. F. W. Kehlet (president and manager), E. F. Roberts (vice-president), and F. J. Goders (secretary and treasurer). Principal office is at 218 Michigan street, N. W., Grand Rapids, Michigan. Jobbers of automobile accessories and tires.

Miller, Robert E., Inc., May 17 (New York), \$200,000. Harry Taffer, Harry A. Rosenberg and Florence R. Nordenschild—all of 19 Cedar street, New York City. To manufacture rubber heels, rubber boots and shoes.

Montford Rubber Co., Inc., April 20 (New York), \$50,000. H. T. Auerbach, Statler Building, H. A. Forbes, 241 Maryland street, and L. B. Dietz, 40 Laurel street—all in Buffalo, New York. To manufacture rubber products.

National Conduit & Cable Co., Inc., April 25 (New York), \$750,000. J. W. Rhoades, 530 West One Hundred and Thirteenth street, New York City; Percy S. Williams, 539 Seventy-third street, and Thomas M. Malone, 404½ Henry street—both in Brooklyn, New York. Principal office, Hastings-on-Hudson, New York. To manufacture wires, cables, insulating materials, etc.

O'Sullivan Rubber Co., Inc., April 30 (New York), \$200,000. Charles A. Corliss, Robert H. Cory—both of Englewood, New Jersey, and William P. Tuttle, 420 Riverside Drive, New York City. Principal office 131 Hudson street, New York City. To manufacture rubber heels, belting and rubber goods, etc.

Overland Tire Co., Inc., April 9 (New Jersey), \$100,000. James A. Whitman, 86 Crescent avenue, Grantwood, New Jersey, John D. Olwell, 236 West Forty-sixth street, and Robert L. Noah, 200 West Ninety-fourth street—both in New York City. Principal office, 15-25 River street, Newark, New Jersey. To manufacture, purchase or otherwise acquire, deal in and sell rubber automobile tires of every kind and description, and other rubber goods used for any other purposes of trade and commerce; to manufacture any and all kinds of machinery as well as appliances and accessories used in the manufacture of rubber automobile tires and rubber goods of every kind, nature and description.

Palmer Tire & Rubber Co., November 28 (Michigan), \$500,000. John F. Palmer (president), Riverside, Illinois; George W. Bulley (vice-president), Marshall D. Wilber (treasurer), W. E. Bryan (secretary)—all of Chicago, Illinois. Principal office, 7 West Tenth street, Wilmington, Delaware. To manufacture rubber, particularly pneumatic tires and tubes and solid rubber tires for any and all kinds of wheeled vehicles, and the sale thereof.

Peters Brothers Rubber Co., Inc., May 2 (New York), \$100,000. William F. Peters and Geo. L. Peters, both of 431 Riverside Drive, and William F. Peters, Jr., 644 Riverside Drive—both in New York City. Principal office, 461-479 Eighth avenue, New York City. To manufacture rubber and gutta percha products and adhesive products generally.

Rex-Hide Rubber Mfg. Co., April 20 (Pennsylvania), \$650,000. N. E. Graham (president), George E. Henry (vice-president), F. L. Ludwick (treasurer), C. A. Russ (secretary), Arthur B. Kempel (general manager), M. N. Davis (sales manager)—all of East Brady, Pennsylvania. Principal office, East Brady, Pennsylvania. To manufacture and specialize in fiber soles.

Ross Vulcanizing & Battery Co., Inc., May 24 (New York), \$10,000. Harry M. Swartz, 1015 Lake Street, Leslie W. Jennison and Thomas M. Losie, both 1240 West Water street, all of Elmira, New York. Tire and battery service station.

Safety Sub-Cushion Automobile Tire Co., April 28 (Missouri), \$5,000. C. E. Robinson, G. W. Young, G. H. Sanford, W. B. Sanford and J. B. F. Showlter. Principal office, Springfield, Missouri. To manufacture and sell certain patent sub-cushion automobile tires and to deal in automobile supplies.

Service Tire & Rubber Co., Inc., May 4 (New York), \$1,000. Sydney Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 Seventh street, and H. H. Jacobson, 555 Grand street—both in Brooklyn, New York. To manufacture tires for autos, etc.

Sherman-Stiveson Tire & Rubber Co., April 27 (Delaware), \$500,000. Wilber A. McCoy, Pittsburgh, Pennsylvania; W. I. N. Lofland, and Charles H. Jones—both of Dover, Delaware. The office of the corporation within the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture, buy, sell and deal in rubber tires for automobiles, motor trucks and other motor driven vehicles, and automobile accessories of every kind and description.

Star Distributing Corp., May 1 (New York), \$1,000. George Norris, George H. Massey and K. Healy—all of 115 Broadway, New York City. To manufacture tires, rubber goods, etc.

Star Tire Co., Inc., The, May 5 (New York), \$1,000. George Norris, George H. Massey and K. Healy—all of 115 Broadway, New York City. To manufacture tires and rubber goods.

Sterling Mills, Inc., April 16 (Rhode Island), \$75,000. Richard B. Chace, Leonard S. Chace—both of Fall River, Massachusetts, and J. Richard Fales, Pawtucket, Rhode Island. To buy, sell, manufacture, dye, bleach, mercerize, etc., yarns, cloths, etc., of all kinds. Principal office, Central Falls, Rhode Island.

Tacoma Tire Service Co., March 2 (Washington), \$7,500. F.

T. Carleton (president and manager), Tacoma, Washington; W. M. Maloney (vice-president and treasurer), and F. C. Shera-ton (secretary)—both of Everett, Washington. Principal office, Tacoma, Washington. To handle Firestone solid and pneumatic tires, with vulcanizing shop in connection.

United Guarantee Tire Co., May 15 (New Jersey), \$100,000. Samuel H. Levy, Louis Herman, and Mayer Krasner—all of Newark, New Jersey. Principal office, 800 Broad street, Newark, New Jersey. To buy and sell automobile tires, tubes, rims and like articles; to manufacture, prepare, deal in and deal with, purchase and sell, all kinds of tires, tire rims, tire tubes and like articles, and automobile accessories of every kind and description, etc.

Wearwell Rubber Co., May 5 (New Jersey), \$60,500. Isidore L. Broadwain, 736 Riverside Drive, New York City; Cassiel A. Kavner, 274 High street, Passaic, New Jersey, and Herman Mendes, 460 Linwood avenue, Brooklyn, New York. Principal office, Schley, Cherry, Dewey and Walnut streets, Garfield, Bergen County, New Jersey. To manufacture, produce, buy, sell, export, import and generally deal in rubber and gutta percha and all goods of which rubber and gutta percha are component parts and the various materials entering into the manufacture of any and all such goods.

FARREL FOUNDRY & MACHINE CO. EXTENDS FACILITIES.

The new erecting shop of the Farrel Foundry & Machine Co., Ansonia, Connecticut, shown in the accompanying illustration, will be used to set up machinery to advantage before shipment. The building is of steel-brick construction, 120 by 400 feet, with a concrete floor throughout. The roof has a sawtooth skylight

FARREL FOUNDRY & MACHINE CO., ANSONIA, CONN.

top of monolithic construction, and all equipment is of the most modern design. A bridge of 40 tons' capacity, equipped with an electric transfer car, connects the new building with the machine shop, the material being unloaded by an electric crane directly from the bridge car to the erecting floor, by means of a 25-ton transfer crane, and the erecting floor being served by four 15-ton electric cranes so placed as to give a head room of 21 feet. A side track of the New York, New Haven & Hartford Railroad enters one end of the building and four cars can be loaded at a time from the loading platform.

The Farrel company is now working on a new extension of its roll shop, which is a building of brick-steel construction, 108 by 103 feet, to be devoted to the machining and finishing of rolls. This building is of modern construction, with steel sash, flat roof, and a skylight of suitable proportions to insure proper light and ventilation. The machine tools designed for this work will be installed in the building and they will be served by one 5-ton and two 30-ton electric cranes.

The Rubber Association of America.

THE Rubber Association of America, Inc., has been particularly active the past month, and a gratifying increase in membership is noted. Perhaps the most important work was that of the Legislative Committee at a hearing before the Senate Finance Committee at Washington, when an amendment was proposed to the war tax legislation now pending. The suggested amendment and the argument are given below in full. A verdict in favor of the Association has been rendered in the Blitz case. The Foreign Trade Division has elected officers and chosen committees. A Tire Manufacturers' Division has been organized. The Arbitration Committee is planning for practical work. A war clause has been adopted to apply to orders and contracts, and the Enlistment Committee is actively engaged in the work for which it is appointed. The details of these proceedings and activities are given below.

THE LEGISLATIVE COMMITTEE AND THE WAR TAX.

On May 5 the Legislative Committee of The Rubber Association of America, Inc., together with Martin W. Littleton, special counsel, appeared before the Senate Finance Committee at Washington, D. C., in opposition to the proposed tax on crude rubber. The suggested amendment and the memorandum brief that were filed with the Committee to supplement the oral arguments are as follows:

Suggested amendment by which the rubber industry will be made to yield \$30,000,000 in taxes annually.

TITLE VI. WAR TAX ON MANUFACTURES

Section 600. That there shall be levied, assessed, collected and paid:

(a) Upon all manufactured rubber articles containing in whole or in part crude rubber or reclaimed rubber sold by the manufacturer, producer or importer, a tax of 5 per centum of the price for which so sold; provided, that in cases where there are contracts in existence for the delivery of such manufactured articles at the time this act becomes a law, the manufacturer, producer or importer shall add to the price for which such article is contracted to be sold, 5 per centum of such contract price, and shall collect and make monthly returns of the same as provided for in Section 601 of this Act; provided further, that no such tax shall be levied, assessed or collected upon manufactured rubber articles destined for exportation.

MEMORANDUM BRIEF.

In the matter of the consideration of House Bill 4,280, with particular reference to title 6, section 600, and also with reference to title 10, section 1,000.

POINT I.—By the provisions of Section 1,000 it is proposed that a tax of 10 per cent ad valorem shall be collected upon all articles not now dutiable by law.

By the provisions of Section 600 of the bill, it is proposed to levy and collect a tax upon all automobiles, motorcycle or bicycle tires sold by the manufacturer, producer or importer equivalent to 5 per cent of the price for which so sold. Crude rubber not now being dutiable by law, will be subjected to a 10 per cent ad valorem tax, when imported, and as 60 per cent of the crude rubber imported goes into automobile, motorcycle or bicycle tires, that per cent will be again subjected to a tax upon the manufactured article of 5 per cent when sold by the manufacturer, producer or importer. This emphasizes a classical example of double taxation upon 60 per cent of the rubber used in the rubber industry.

POINT II.—By the provisions of Section 1,000 of the House Bill which makes dutiable every imported article now upon the free list, the comprehensive and well balanced scheme for the raising of war revenue is totally deranged. The scheme of the bill, manifest from its text and revealed in the debates, was the imposition of a consumption tax and the imposition of income and excess profit taxes as a sure and equitable method of raising the desired revenue. By this method \$1,600,000,000 was provided for without interfering with existing tariff rates and without disturbing the well considered free list. In order to raise an additional \$200,000,000 of revenue the entire group of tariff schedules, along with the multiplied items of the free list, are incorporated into the bill in Section 1,000, and a 10 per cent

additional ad valorem tax fixed upon articles now dutiable by law and a like 10 per cent upon articles not now dutiable by law. The unwisdom, inequality and unscientific character of this levy of customs duty is frankly and forcibly recognized in the report of Mr. Kitchin from the Committee on Ways and Means, in which it is said: "Your committee realizes that this tax is neither scientifically nor equitably adjusted, and recommends the same only as a war tax." It has long been the hope of eminent economists and public men that the time would arrive in this country when the revenues of the Government could be increased or diminished, as occasion required, without disturbing or upsetting the industries of the country, and if the scheme of this bill, which was designed to impose a tax at the point of consumption, a tax at the point of the collection of income, and at the point of the gathering in of the excess profits, had been adhered to, while there would have been an additional burden to have been borne, it would not have precipitated a disturbance at the very roots of all industry in the country by laying an initial tax upon all non-dutiable importations and an additional tax upon all dutiable importations. The committee has only to consider a few items now made dutiable by Section 1,000 to ascertain the far reaching effect of this proposed levy. The bagging for cotton, copper ore, the fertilizer material, the hides of cattle, the lumber and the wool, and the silk and the rubber. These indicate the extent to which the tariff question is involved in this legislation. Surely if the Ways and Means Committee were able to provide for \$1,600,000,000 of revenue without disturbing the tariff schedules and without burdening the free list, it ought not to be difficult, by a further extension of the excise and excess profit tax, to provide this additional \$200,000,000 and avoid the recognized inequalities of the customs levy provided by Section 1,000.

POINT III.—A tax of 10 per cent upon importations of crude rubber is the one tax which is most hurtful to the industry and least fruitful of revenue, hurtful to the industry because of the tendency it would have in curtailing importations. The market price of first grade plantation rubber in London to-day is 37d. or figured with exchange at \$4.76½, equals .7346 per pound. Charges to New York are to-day approximately 7 cents per pound, which makes the rubber purchased in London cost 80 cents when landed here. Adding 10 per cent, the rubber would cost, with the proposed duty, 88 cents, which is a high figure when it is considered that the average for this grade of rubber in 1915 was 65½ cents, and in 1916, 73 cents. In normal times manufacturers, on an average, carried about three months' supply of rubber at the mills. To-day this reserve is cut to about one month. The natural fear which arises from the proposal to tax crude rubber is that at 88 cents per pound, manufacturers will be inclined to take chances and will decline to increase their stocks to a three months' basis, which it is believed in the industry is essential to safety. Most of the rubber produced in the world comes from the Federated Malay States and from Brazil. The former country imposes an export tax of 7½ per cent, the latter of about 23 per cent. The policy of the British Government, for economic reasons, is to divert as much of the British-grown rubber as possible to London to be re-distributed from that point. No export tax has as yet been placed by Great Britain on shipments from the British Isles, but if, as a revenue measure, the British Government should impose an export tax, which is a strong probability, the economic position of America would be possibly untenable. The rubber stock in the United States at present presented in the day's supply is as follows:

Stocks on hand at mills March 31, 1917.....	30 days
Stocks in transit actually in United States.....	17 days
Stocks for which permits have been issued but which have not yet arrived in the U. S.....	29 days
Total in U. S. and permitted.....	76 days

Another advantage of decided importance in having an excise upon the manufactured article as against a customs levy on the imported crude article is that such excise tax would not be imposed upon manufactured rubber articles destined for exportation, and hence the industry would be able to contend in the markets of the world with its competitors, without the burden of this tax, whereas a tax upon importations of crude rubber would fix an initial burden and create a continuing disadvantage which would accompany the article through all of its forms of manufacturing and into the channels of exportation.

Summarizing the matter as briefly as possible, it is submitted:
First. That the tariff duties imposed by Section 1,000 of the House bill have no logic or just place in the scheme of taxation proposed, and should be entirely eliminated from the bill.

Second. That tariff duties upon raw material are wholly inimical to the welfare of American industry and impose a burden upon the manufacturing agencies of this country at a time when the whole nation stands in need of their greatest strength and support.

Third. The levy of a tariff duty upon crude rubber, an article of such vital necessity wholly produced outside of the United States, will have a strong tendency to curtail importations, and thus produce a shortage of crude rubber in the United States.

Fourth. The excise tax imposed by Section 600 of the House bill upon automobile, motorcycle and bicycle tires of 5 per centum of the price at which these tires are sold by the producer, manufacturer or importer, while just in itself and the subject of no complaint standing alone, is as the bill is drawn tantamount to double taxation.

Fifth. The Ways and Means Committee, having provided successfully for \$1,600,000,000 of revenue by means of income, excess profits and consumption taxes, the Congress is not warranted in taking up and dealing with the tariff upon importations of all kinds in order to raise the balance of \$200,000,000 of revenue, especially when this revenue could in large measure be provided for by a further extension of the excise and excess profits taxes.

Respectfully submitted,

LEGISLATIVE COMMITTEE,
FREDERIC C. HOOD, Chairman;
H. STUART HOTCHKISS,
GEORGE B. HOUGHMAN,
FRANK A. SIEBERLING,
HARVEY S. FIRESTONE, Ex-officio;
HARRY S. VORHIES, Secretary.

ASSOCIATION WINS BLITZ CONSPIRACY SUIT.

The decision in the case of Ludwig Blitz v. The Rubber Control Committee, by which a verdict was returned for the defendant, is a most important victory for the American rubber trade, as it has resulted in a complete vindication of the acts of The Rubber Association of America.

This suit was brought in the fall of 1915, the plaintiff alleging his crude rubber business was ruined by the defendant to the extent of \$100,000. The testimony of Sir Francis Hapwood, Lord of the British Admiralty, and Sir Nathaniel Highmore, Secretary of the War Trade Department, being taken last winter in London. The testimony of Sir Richard Crawford, K.C.M.G., Commercial Advisor of the British Embassy, was taken in Washington, D. C. The jury trial was heard by Supreme Court Justice Cropsey, in Brooklyn, May 14-19. In summing up his charge to the jury, the Judge said: "That the only point for you to decide is the exceedingly simple one of whether or not these men (the defendants) have wrongfully, unlawfully or wilfully conspired together to injure the plaintiff." After being out about a half hour, the jury returned a verdict for the defendants.

Attorneys for the defendants were Charles Neave, Herbert Smyth and Sidney S. Meyer. For the plaintiff, Francis I. Tierney.

NEW MEMBERS.

At the meeting of the Executive Committee, May 14, the following firm and associate members were elected:

FIRM MEMBERS.

C. H. Wright, Racine Auto Tire Co., Racine, Wisconsin.
Yuji Nagashima, Mitsui & Co., Limited, San Francisco, California.
James Meade, Meade Rubber Co., Stoughton, Massachusetts.
H. M. Dannebaum, The Schwarzwaelder Co., Philadelphia, Pennsylvania.
Lester D. Gardner, The Gardner, Moffat Co., Inc., New York City.
A. E. Gordon, Gryphon Rubber Tire Corp., New York City.
William A. Sweet, Hardman Tire & Rubber Co., New York City.
Robert D. Landrum, The Harshaw, Fuller & Goodwin Co., Columbus, Ohio.
H. L. Green, The G. Mathes Co., New York City.
L. H. Firey, The Star Rubber Co., Akron, Ohio.
LeRoy Clark, The Safety Insulated Wire & Cable Co., New York City.
B. C. Tunison, The East Palestine Rubber Co., Pittsburgh, Pennsylvania.
Chas. G. Gates or John G. Gates, Colorado Tire & Leather Co., Denver, Colorado.
Joseph Chalfire or A. Boardman, Joseph Chalfire, New York City.
Ed. C. Griffith, H. A. Demarest or K. G. Johnston, Beacon Tire Co., New York City.
B. Reysnider, Aluminum Flake Co., Akron, Ohio.

W. O'Neil, The General Tire & Rubber Co., Akron, Ohio.
L. F. Smith, The Amazon Tire & Rubber Co., Akron, Ohio.
Henry L. Houk, The American Rubber & Tire Co., Akron, Ohio.

TRANSFERRED FROM ASSOCIATE TO FIRM MEMBERSHIP.

Warren MacPherson, Cambridge Rubber Co., Cambridge, Massachusetts.
Paul Loewenthal, The Loewenthal Co., Brooklyn, New York.
R. M. Loewenthal, R. M. Loewenthal Co., New York City.
Calvert B. Archer, Archer-Strauss Rubber Co., Framingham, Massachusetts.

ASSOCIATE MEMBER.

William O. Cutter, United States Rubber Co., New York City.

NATIONAL INDUSTRIAL CONFERENCE.

Van H. Cartmell, president of the Kelly-Springfield Tire Co., New York City, was delegated to represent the Rubber Association at the meetings of the National Industrial Conference to be held at Boston, Massachusetts. Frederic C. Hood, Hood Rubber Co., Watertown, Massachusetts, was delegated to serve as the other member.

ANNUAL OUTING MAY NOT BE HELD.

Due to the war and the consequent activities of the rubber trade in more serious matters, the Outing Committee has recommended that the Annual Outing should be abandoned this year and the money, usually subscribed for that purpose, be contributed to the Red Cross or some equally worthy cause.

WAR CLAUSE FOR ORDERS AND CONTRACTS.

The Rubber Sundries Manufacturers' Division and the Mechanical Rubber Goods Manufacturers' Division have adopted the following war clause to apply on orders and contracts:

Due to present extraordinary conditions in this country it is understood and agreed that if, during any period of this contract or order, the seller makes a general reduction in his prices for the merchandise described herein, it will give the purchaser the benefit of such reduction of prices on any unfilled portion of said contract or order. Likewise, if the cost of manufacture of said merchandise increases, it is further understood and agreed that the seller shall have the right to notify the purchaser of advances in prices on all unfilled portions of the contract or order, whereupon the purchaser shall promptly notify the seller either of the acceptance of said advance in prices or the balance of the contract or order shall thereupon be cancelled.

It is agreed that the order is accepted on the understanding that delivery be made at or as near the time specified as manufacturing conditions will permit.

All prices are subject to any import duties or revenue taxes which may be imposed and which shall be for the account of the buyer.

CRUDE RUBBER SALES CONDITIONS.

The rules and regulations adopted by The Rubber Association of America, Inc., to govern transactions between buyers and sellers of crude rubber have been published in pamphlet form and distributed to the members. These rules and regulations follow very closely the draft published in THE INDIA RUBBER WORLD (February 1, 1917, page 256), one or two unimportant changes being made in several sections. Rule 3, however, is materially changed and now reads as follows:

3. Where a parcel of rubber is sold with a description of quality inferior to that specified in Rule 1, Section A, and upon delivery is found inferior to the description in whole or in part, then the buyer must accept the same with allowance, provided such allowance in the opinion of the arbitrators, be not more than two cents per pound on the inferior portion; but should the allowance be more than two cents per pound the parcel in whole or in part may be rejected and the seller may substitute proper quality to fulfil his contract at the original point of delivery in the United States of America or Canada or at the Port of New York within ten days from the time of rejection or within the time for delivery as the case may be. In case the seller does not replace, the buyer at his option may cancel the contract, or buy and charge the difference, if any, to the seller.

ENLISTMENT COMMITTEE FOR NEW YORK.

One of the most practical and important committees of the Rubber Association is that on Enlistments in the National Guard of the State of New York, consisting of W. G. Ryckman, W. G. Ryckman Co., Inc., New York City, chairman; Amedee Spadone, Gutta Percha & Rubber Manufacturing Co., New

York City; R. C. Fisher, United States Rubber Co., New York City.

The day of their appointment they began an energetic canvass right at home in New York State to help secure the New York quota of 10,000 men requested by Governor Whitman for the New York National Guard. As we go to press they are extending their work to all sections where the rubber trade is represented.

FOREIGN TRADE DIVISION ELECTION.

At the meeting of the Foreign Trade Division held May 1, 1917, the following officers were elected: E. H. Huxley, United States Rubber Export Co., Limited, New York City, chairman; C. O. Brandes, Firestone Tire & Rubber Co., Akron, Ohio, vice-chairman; H. S. Vorhis, The Rubber Association of America, Inc., secretary and treasurer. The following were elected members of the Executive Committee:

Henry G. Tyer, Tyer Rubber Co., Andover, Massachusetts.
William B. Loughton, Hood Rubber Co., Watertown, Massachusetts.
R. J. Owens, Boston Woven Hose & Rubber Co., Cambridgeport, Massachusetts.
A. S. Hardy, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.
P. G. Smith, Goodyear Tire & Rubber Co., Akron, Ohio.

The following is a list of the members of the Foreign Trade Division and the companies they represent.

D. Bardin, Michelin Tire Co., Milltown, New Jersey.
H. D. Benner, Federal Rubber Co., 38 West Sixty-second street, New York City.
W. P. Berrien, Batavia Rubber Co., Batavia, New York.
Herbert W. Bixler, Republic Rubber Co., 149 Broadway, New York City.
E. E. Bloom, Endurance Tire & Rubber Co., 17 Battery Place, New York City.
Harry Braender, Braender Rubber & Tire Co., 250 West Fifty-fourth street, New York City.
C. O. Brandes, Firestone Tire & Rubber Co., Akron, Ohio.
H. H. Burtis, Lovell Manufacturing Co., 86 Warren street, New York City.
G. C. Chalmers, Hodgman Rubber Co., Tuckahoe, New York.
H. H. Coleman, Delion Tire & Rubber Co., Trenton, New Jersey.
E. A. Craver, A. J. Bates & Co., 176 Duane street, New York City.
F. E. Dayton, Ajax Rubber Co., Inc., 1708 Broadway, New York City.
W. W. Dupuy, Pennsylvania Rubber Co., Jeannette, Pennsylvania.
P. L. Fellingner, Gordon Tire & Rubber Co., 50 Broad street, New York City.
A. A. Garthwaite, Lee Tire & Rubber Co., Conshohocken, Pennsylvania.
J. M. Gibbs, Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.
W. E. Greene, Boston Belting Co., 102 Reade street, New York City.
Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio.
A. S. Hardy, Manhattan Rubber Manufacturing Co., 120 Broadway, New York City.
Hugo Hoffstaedter, Polack Tyre & Rubber Co., 1876 Broadway, New York City.
E. H. Huxley, United States Rubber Export Co., Limited, 1790 Broadway, New York City.
E. K. Johnson, American Hard Rubber Co., 11 Mercer street, New York City.
Wm. B. Loughton, Hood Rubber Co., Watertown, Massachusetts.
Frank Le F. Lawrence, A. G. Spalding & Bros., 128 Nassau street, New York City.
W. V. Logan, McGraw Tire & Rubber Co., 515 West Fifty-sixth street, New York City.
H. L. McClaren, Racine Rubber Co., Racine, Wisconsin.
Jno. Macfadyean, Goodyear Tire & Rubber Co., Akron, Ohio.
Jno. B. Maus, The Fisk Rubber Co., 11 Broadway, New York City.
I. L. Miller, Faultless Rubber Co., Ashland, Ohio.
Geo. H. Moss, Electric Cable Co., 10 East Forty-third street, New York City.
William Niedner, Chas. Niedner's Sons Co., Malden, Mass.
R. J. Owens, Boston Woven Hose & Rubber Co., 30 Church street, New York City.
H. H. Replogle, Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio.
E. A. Sattler, Howe Rubber Co., New Brunswick, N. J.
G. S. Towne, Bowers Rubber Works, San Francisco, California.
H. G. Tyer, Tyer Rubber Co., Andover, Massachusetts.
C. E. Wagner, Miller Rubber Co., Akron, Ohio.
Thomas F. Walsh, Swinehart Tire & Rubber Co., Akron, Ohio.

The Executive Committee of the Foreign Trade Division appointed the following committees at the meetings of May 14, 1917:

TIRES.—C. O. Brandes, Firestone Tire & Rubber Co., chairman; F. E. Dayton, Ajax Rubber Co.; John Macfadyean, Goodyear Tire & Rubber Co.; John B. Maus, Fisk Rubber Co.; H. W. Bixler, Republic Rubber Co.

DRUGGISTS' SUNDRIES.—H. G. Tyer, Tyer Rubber Co., chairman; Charles J. Davol, Davol Rubber Co.; G. C. Chalmers, Hodgman Rubber Co.; C. E. Wagner, Miller Rubber Co.

FOOTWEAR.—J. M. Gibbs, Beacon Falls Rubber Shoe Co., chairman; William B. Loughton, Hood Rubber Co.

E. H. Huxley, United States Rubber Export Co., New York City, chairman of the Division, is a member *ex-officio* of all sub-committees.

SHIPMENTS ALLOWED TO SCANDINAVIA, HOLLAND AND DENMARK.

Manufactured and partly manufactured rubber goods may henceforth be shipped by way of Halifax to Scandinavia, Denmark and Holland, notwithstanding the provisions of the Agreements and Guarantees, which call for their movement to those destinations by way of the United Kingdom. Shippers must make applications through their agents in England to the War Trade Department for a license authorizing the export of goods from the United Kingdom.

As soon as the export license has been issued, the Foreign Office will notify the Embassy at Washington by telegraph, and the Embassy will issue a special certificate known as a "License Navicert," which the shipper will have to deliver to the shipping company for attachment to the ship's manifest. The Embassy will at the same time inform the authorities at Halifax of the issue of the License Navicert, advising them of the name of the vessel on which the goods will go forward. The vessel will be met at Halifax by the export license issued by the War Trade Department in London, and this will be handed by the naval authorities to the master of the ship.

A cablegram has been received, which gives details of arrangements decided upon by the British Government, regarding restrictions of importation of rubber manufactures into England, and also regarding direct shipments to Spain and Northern European countries. The message reads:

Interview with Board of Trade confirms that shipments destined for Scandinavian countries will go via Halifax avoiding England. Shipments for Spain by direct steamer will be permitted the exact method of control to be shortly determined on. All goods intended for England leaving factories or ports on through bills of lading prior to May 10 will be admitted without license. Any shipments which may be near but not prior to that date will be admitted by license. Administrative interpretation with the respect to these cases will be reasonable. All products needed for war will be licensed for admission. Government considering rationing tires on proportion last year's imports. Mail all inland railroad bills of lading prior to May 10. Also any shipments between May 10 and June 1. Expect to get all of these passed.

RUBBER GOODS IMPORTS INTO GREAT BRITAIN REQUIRE LICENSE.

The importation of all manufactured rubber goods into Great Britain has been prohibited from May 10, 1917, except under license from the Board of Trade. Exports of these goods from Great Britain, except to British possessions, has also been prohibited.

BRITISH BLACK LIST WITHDRAWN.

The Association has been officially advised by the British Consul General, New York City, under date of May 7, 1917, that the statutory list of firms, commonly known as the "British Black List," in the United States of America, has been withdrawn. The statutory list as published, however, remains in full force and effect in all neutral countries.

PROOFERS DIVISION ELECTS OFFICERS.

The following officers of the Proofer's Division were elected at the last meeting:

L. C. Himebaugh, British-American Manufacturing Co., Springdale, Connecticut, chairman; H. M. Dannebaum, the Schwarzwaelder Co., Philadelphia, Pennsylvania, vice-chairman; H. S. Vorhis, secretary and treasurer. Executive Committee: L. C. Himebaugh, chairman; H. M. Dannebaum, J. Sydemann, Plymouth Rubber Co., Canton, Massachusetts; C. B. Archer, Archer-Strauss Rubber Co., Framingham, Massachusetts; T. J. Callahan, Archer Rubber Co., Milford, Massachusetts.

TIRE MANUFACTURERS' DIVISION ORGANIZED.

At the meeting of tire manufacturers held May 18, it was voted that a Tire Manufacturers' Division of The Rubber Association of America, Inc., should be organized. The object of this division will be to bring the tire manufacturers of the United States together and to perfect an organization that will promote the interests of the members.

THE ARBITRATION COMMITTEE TO PREPARE OFFICIAL LIST.

The Committee on Arbitration is now ready to establish the official list of arbitrators to be composed of men reasonably expert in the following branches of the rubber industry.

Crude rubber importers, dealers, brokers and factory experts; manufacturers of tires—pneumatic and solid; mechanical goods;

boots and shoes; insulated wire and cables; druggists' sundries, surgical goods and specialties; hard rubber goods; clothing and proofers; dental and stamp rubber, stationers' and artists' sundries; sporting goods, golf balls, etc.; dress shields and notions; rubber cement; reclaimed rubber. Manufacturers and dealers in: Rubber substitutes; chemicals; rubber machinery; fabrics; scrap.

Firm members are requested to send to the Secretary names of one or more men, either officials or employees, indicating the particular branch in which they are qualified to act.

The Committee on Arbitration follows:

W. G. Ryckman, W. G. Ryckman Co., Inc., New York City, chairman.
A. H. Brown, Meyer & Brown, New York City.
W. E. Bruyn, L. Littlejohn & Co., Inc., New York City.
W. F. Bass, General Rubber Co., New York City.
Horace De Lissier, Ajax Rubber Co., Inc., New York City.
R. B. Woodbury, Hood Rubber Co., Watertown, Massachusetts.
M. L. Cramer, Michelin Tire Co., Milltown, New Jersey.
H. S. Vorhis, New York City, Secretary.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AKRON never lags behind the times in any question affecting industrial activity, and the recent adoption of Eastern time in this city is in accordance with her progressive policies. This change, setting the clocks one hour ahead, allows the working hours to conform most satisfactorily with daylight conditions.

Women workers here are being swept into the emancipating spirit of the war and have adopted a working garb of khaki blouses and bloomers, a sensible and attractive uniform that allows perfect freedom and timely economy.

* * *

At a meeting of The General Tire & Rubber Co. on May 15, the capital stock was increased from \$500,000 to \$1,000,000. The company is working its plant day and night and producing an average of over 380 tires per day. An addition half the size of the original plant has lately been erected, in which a full equipment of machinery is now being installed.

Ten acres of land east of the factory has been donated by the company to its employees for garden plots.

* * *

The Adamson Machine Co. has recently installed equipment for cutting cast iron or steel spur gears up to 6 feet in diameter by 20-inch face.

* * *

The enormous factory of The B. F. Goodrich Co. now has a subway system of its own by means of which rubber-tired electric tractor trains are enabled to transport materials underground from one building to another.

The main line of this traffic tunnel is about 110 feet long and its laterals, or communicating tunnels, measure an additional 600 feet. The tube is of reinforced concrete and brick construction, rectangular in shape, 14 feet wide and 9½ feet high.

The cars employed are so constructed that they may be handled by men in the workrooms as well as by the tractor in the tunnels, and they may be switched off in any factory building. Each building is a receiving and shipping depot on the subway line.

In order to successfully handle the 18,000 calls received at the Goodrich factory, a special telephone system is being installed, which includes a private telephone directory giving the name and 'phone number of most of the employees and the attachment of electric bells which ring in each department when a man is wanted.

The 20,000 employees of the Goodrich company have begun working on eight-hour shifts for the summer months, allowing the workmen opportunity to cultivate the flower and vegetable gardens which they are encouraged to plant in their home yards. The value of this in social economy is self-evident.

Upon the departure of Arthur H. Leavitt, assistant sales manager of the motor truck tire department of the Goodrich company for Fort Sam Houston, Texas, to serve as Captain in the

Quartermaster's Reserve Corps of the United States Army, a handsome sword was presented to him as a token of the regard of his associates. W. O. Rutherford, on behalf of the Operating Committee, made the presentation speech.

* * *

E. W. BeSaw has been selected to fill the newly created position of assistant general sales manager for the Firestone Tire

E. W. BESAW.

& Rubber Co., H. A. Grubb, Texas manager, succeeding him as western district manager. Mr. BeSaw became connected with the company in 1912, as salesman at the Chicago, Illinois, branch, a year later becoming manager of the branch at Des Moines, Iowa, and on January 1, 1916, receiving the appointment of western district manager, from which he comes to his new position.

C. H. Sorrick is the newly appointed manufacturers' sales manager, J. D. Hess, Jr., Cleveland branch manager succeeding him as manager of the pneumatic sales department. Mr. Sorrick joined the Firestone forces in 1911, in the carriage tire department, and in 1914 became manager

of the pneumatic sales department. His latest appointment is to fill the vacancy created by the death of Frank C. Blanchard last February.

The Firestone fellowship in Akron University has been won by H. A. Smith, who will specialize in rubber chemistry.

* * *

The Amazon Tire & Rubber Co. will hereafter be known as the Amazon Rubber Co. It has been recapitalized at \$500,000. It manufactures anti-blow-out pneumatic auto tires, and a line of heavy brown inner tubes. The officers remain the same as under the old organization, namely: L. J. Schott, president and secretary; L. F. Smith, vice-president and purchasing agent, and C. E. Bettler, treasurer.

* * *

The American Rubber & Tire Co. has increased its capital stock to \$1,000,000. Of this amount only \$100,000 is issued at present and it has all been taken by the stockholders. A new addition to the company's plant is under course of construction.

C. H. SORRICK.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

AT the annual election of the Boston Chamber of Commerce, May 15, Everett Morss, president of the Simplex Wire & Cable Co., was one of the seven prominent business men elected to serve three years as directors of the Chamber, and at a meeting of the directors was elected a member of the executive committee. Mr. Morss is a man of large business interests. Besides being president of the above-named company he is a director in the Boston Belting Co., and the Chemical Products Co., vice-president of the Simplex Electric Heating Co., president and director of the Morss & Whyte Co., trustee of the Morss Real Estate Trust, and director of the First National Bank. He is also a member of the corporation, and of the executive committee of the Massachusetts Institute of Technology and a Fellow of the American Institute of Electrical Engineers, and the American Society of Mechanical Engineers. There is an old saying that if you want a thing well done, ask a busy man to do it. Mr. Morss should certainly be able to qualify as a busy man.

It might seem somewhat invidious to describe the many flag raisings and patriotic doings at the various rubber factories in and around Boston, but the two affairs at the plants of the Boston Rubber Shoe Co. present some variations from the usual program, and are therefore worthy of comment. At the Edgeworth plant a beautiful 20 by 30-foot flag was purchased by the employees. Major Ballard, the assistant treasurer, presided. There was an address by the Mayor of Malden, two women cornetists accompanied, and another woman employee led the singing. They were attired in patriotic costumes. The flag was broken out by the oldest employe, Sherman Lynde, a Civil War veteran, who had just passed his seventy-ninth birthday. When the flag was unfurled confetti and miniature flags dropped upon the company, the latter being eagerly seized as souvenirs of the occasion.

* * *

A similar celebration was held at the "Fells" factory of the company, which was in charge of Assistant Superintendent Lawrence. Here, also, the flag was bought by voluntary contributions of the workers, who also shared with the company in purchasing and erecting the 80-foot flagpole. Mayor Adams, of Melrose, delivered an eloquent patriotic address, and Principal Alexander, of the High School, also addressed the assemblage. When the flag was unfurled, 300 miniature flags fluttered down, and then, led by Mr. Lawrence, all present pledged allegiance to the flag. Singing of the national hymns was under the leadership of Miss Johnson, accompanied by cornetist Miss De Mont, both employees of the company.

* * *

The bowling league of the Converse Rubber Shoe Co. held its annual banquet at the Quincy House, in this city, May 12. Addresses were made by Superintendent Bullock and President Marquis M. Converse. Chester Emerson, assistant superintendent, awarded the trophies to the members of the winning team and also individual prizes for high string and high three strings. The "Triple Tread Quartet" (workers in the factory) furnished music for the occasion.

* * *

Irving B. Wells, formerly with the Converse Rubber Shoe Co., of Malden, has been appointed manager of footwear sales for New England and the Maritime Provinces for The B. F. Goodrich Co., with offices at the Boylston street headquarters of the company in this city.

* * *

The Apsley Rubber Co., Hudson, this state, is extremely busy, with orders for clothing and footwear sufficient to employ all available help. The company is also working on a large contract for ponchos, or similar goods, for the Government.

* * *

J. G. Budd, of the export department of the Fisk Rubber Co., Chicopee Falls, Massachusetts, has just returned from a business trip to the Far East. He reports a most encouraging outlook for still further increased business for the company in all sections visited.

* * *

The Consolidated Rubber Co., Cambridge, Massachusetts, has been appointed distributing agent for the Star Rubber Co., Akron, Ohio. The Consolidated company, whose salesrooms are at 167 Massachusetts avenue, will distribute Star tires throughout New England.

* * *

Sales Manager Turner, of the Monatiquot Rubber Works Co., states that his company has fallen into line to enable its employees to escape the high cost of living. The company has plowed, harrowed, and otherwise developed a portion of its property at South Braintree which has been allotted to its employees for cultivation. In some instances the seed for such cul-

tivation has been distributed free and in other instances furnished the employees at reduced cost.

* * *

The Boston Rubber Shoe Co. is preparing plans for a four-story brick addition to its Edgeworth plant.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber mills of Rhode Island continue to be operated at their utmost capacity, with sufficient orders ahead to maintain the present conditions for an indefinite number of months. Evidence that the Rhode Island rubber factories are engaged upon Government contracts is shown in the list of manufacturing concerns in the State wherein Government work is being done, that the United States Marshall for this district has recently made public under instructions from the Attorney-General at Washington, and within a half-mile of which unnaturalized Germans are forbidden to go after June 1 without a special permit from the Marshall's office. Included in this list are the following:

Narragansett Rubber Co., Wood street, Bristol; National India Rubber Co., Bristol; Alice Mill of the Woonsocket Rubber Co., Fairmont street, Woonsocket; Collyer Insulated Wire Co., North Main street, Pawtucket; Tubular Woven Fabric Co., Main street, Pawtucket; Washburn Wire Co., East Providence; Davol Rubber Co., Providence; Revere Rubber Co., Providence; Mechanical Fabric Co., Providence; New England Butt Co., Providence, and the O'Bannon Co., West Barrington.

* * *

At the plant of the Revere Rubber Co., Providence, a large sand-blast mechanism is being installed.

* * *

The Joseph Banigan Rubber Co. and the Woonsocket Rubber Co., subsidiaries of the United States Rubber Co., have filed certificates giving notice of substantial reductions in their capital stock. The Woonsocket Rubber Co.'s capital stock is reduced one-half, from \$3,000,000 to \$1,500,000, and The Joseph Banigan Rubber Co. reduces its capitalization from \$1,500,000 to \$1,250,000.

* * *

The National India Rubber Co. at Bristol reports an unusually busy period, the operatives turning out an average of 47,000 pairs of rubber shoes a day. Increased freight and railroad facilities are being added to the local station to handle the additional product.

* * *

The International Rubber Co., at West Barrington, went on day schedule the past month and expects to so continue indefinitely. The concern is manufacturing carriage cloth, and has been in operation on day and night shifts for several months. The demand for carriage cloth, however, is not so brisk at the present time as it has been for more than a year, so that the night shift has been discontinued.

* * *

The first outing and chicken dinner of the season under the auspices of the F. O. B. Club of the Revere Rubber Co. was held at Emery Park the early part of the past month, upwards of 75 members and guests being in attendance. A baseball game between the married and single men was a feature of the athletic program, the former winning by a score of 7 to 3. Prizes were awarded to the winners in the several sporting events and vocal and instrumental music followed.

* * *

Josephus Farron, Jr., for several years assistant in the laboratory of the Woonsocket Rubber Co.'s Alice Mill, has accepted a position as assistant to State Chemist and Sanitary Engineer Stephen De M. Gage, connected with the State Board of Health

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE long winter, with snowstorms and frost up to the middle of April, has decreased the demand for water-proofs and oilskins and incidentally for bicycle tires. Of course the weather is not the sole cause of the slackness in the proofing industry, outside Government orders, because the conditions regarding freight and export, referred to on former occasions, have become more accentuated. Moreover, buyers who were frantic to get their orders placed six months ago are now showing great reluctance to accept delivery in bulk. A consequence of this is that goods are being closely scrutinized to see whether they come up to the standard ordered so as to give plausible grounds for rejection if such a course recommends itself under the circumstances of the moment. A year or so ago foreign orders were only accepted by one prominent manufacturer on the proviso that the goods as dispatched must be accepted and that no complaints would receive attention.

CHEMICALS AND COMPOUNDING INGREDIENTS.

In the important domain of rubber chemicals, America has a pull over Great Britain at the moment with regard to sulphur, as she can supply her own requirements. This is reflected in the current prices in Britain and New York. Not only is the price now very high here, but the material has now been placed under official control. This may probably lead to the utilization of certain sulphurs obtained as by-products in chemical manufacture which have hitherto been rejected by the rubber works on account of their odor or some impurity which might not really preclude their use to advantage if given a proper trial. Lamp black in the form of high-grade carbon black, now being so extensively used in the rubber trade, is another article in which America scores by a large home output. As regards barytes, the embargo put on the export from America is of no concern to us, because our own output is being increased largely and whatever the users may think about it the stoppage of American exports has been received with satisfaction by mine owners.

RUBBER STATISTICS SUPPRESSED.

For certain reasons, statistics of various trade details of exports and imports have now been suppressed and the rubber trade is among those affected. Statistics, of course, are not widely read but there is always a certain number who find them illuminating and useful, if not absolutely essential, and who will deplore their absence.

PLANTATION RUBBER.

With regard to plantation rubber the figures for the past twelve months or so show such a large increase as to indicate either that the yield per acre has greatly exceeded the estimates or that the acreage under rubber cultivation has been understated. This increased yield seemed to cause some concern at the meeting of the Rubber Growers' Association, and it was urged that a census should be taken with regard to the probable output of rubber in forthcoming years. A more effective control of this output has been advocated in more than one quarter, more particularly in connection with the important position held by America as the purchaser of the total British output. The idea is held that although things may be all right when trade conditions in America are good, the British planters would be in an awkward position if the American demand fell off owing to a depression of trade.

CABLE MAKERS' ASSOCIATION.

On the death of A. H. Howard, who had for many years been secretary of the association, the post has recently been taken over by L. B. Atkinson, a director of W. T. Glover & Co., Limited,

of Trafford Park, Manchester. The association, the headquarters of which are at Sardinia House, Aldwych, London, has been in existence over 20 years and the cables that bear its distinctive mark are of a recognized standard quality.

THE EYES OF THE SUBMARINE PATROL.

One of the most effective means of dealing with submarines yet devised by the British navy is the small scouting dirigible, shown in flight by the accompanying illustration. The car is a slight

modification of that of a monoplane with rubber-tired wheels beneath for landing. The head of the pilot can be seen near the front and that of the observer behind him, but the whirring blades of the propeller have been lost to view because of their rapid motion. Hundreds of these small airships are constantly tracking commerce destroyers in the English channel. In clear, calm weather submarines can be seen when under water, and bombs dropped upon them. The dirigibles are also equipped with wireless apparatus for summoning patrol boats.

TRADE NOTES.

The Gee Cross Rubber Co., of Hyde, near Manchester, has established a new branch works for the manufacture of tubes and accessories for the cycle trade at Burton-on-Trent, a town hitherto better known in connection with the manufacture of beer than of rubber. Mr. Saunders, who is the manager and moving spirit, was formerly manager of the Garton Rubber Company's works.

The De Luxe truck tires of The B. F. Goodrich Co., now well known in America, have just been introduced to the British market through the London and provincial depots, though it is too soon to say anything definite with regard to their reception. For the benefit of English readers I may say that the term "truck" in America is synonymous with the term heavy commercial vehicle in England. Up to now the company's principal tire business has been in pneumatics for pleasure cars and light lorries, and these have established for themselves a favorable reputation. A prominent part of the business done is with the Ford Motor Co., all the cars turned out of the Manchester works being fitted with them.

The Macintosh pneumatic tire is this season being sent out with a new tread which I hear highly spoken of. This tire is marketed locally by the Astra Rubber Co., 231 Deansgate, Manchester.

The bicycle is experiencing a revival, owing to the petrol restrictions, and special attention to bicycle tires is being paid this season by several makers. In this connection the heavy high-grade tandem mottled tire, made by W. A. Bates, Limited, St. Mary's Mills, Leicester, and bearing the legend "All-Weather," may be mentioned. The new prices are, wired-on cover 11s., tube 5s.

The Moseley motor tire is put before the public this season without any advertised improvement on its established merits. The new prices are:

Size	Grooved Cover.			Tube.		
	£	s.	d.	£	s.	d.
760 x 90 millimeters.....	3	6	0	1	6	3
815 x 105 millimeters.....	4	18	6	1	2	3
880 x 120 millimeters.....	6	7	9	1	10	0

The Goodyear Tyre & Rubber Co., Limited, of Kingsway, London, has been busy establishing provincial depots at Birmingham, Glasgow, Belfast, Manchester, Bristol and Dublin, while a more recent American competitor for the British trade is the Firestone tire, which has already aroused considerable interest.

P. D. Saylor, managing director of the Goodyear Tyre & Rubber Co., (Great Britain) Limited, is now a captain with the Canadian forces in France, in the medical division. Mr. Saylor, who formerly was a physician, proffered his services early in the war, but they were not needed at that time. When the offer was repeated recently, the authorities accepted it and gave him a commission as captain.

THE RUBBER GROWERS' ASSOCIATION.

AT the annual meeting of The Rubber Growers' Association, at the Cannon Street Hotel, London, England, March 30, Sir Edward Rosling was elected chairman for the ensuing year, and Sir John Anderson, vice-chairman. Nineteen ordinary

SIR EDWARD ROSLING.

members of the council of the Association were then elected as follows: Charles Emerson, A. A. Allen, M.P., Sir A. Sharp Bethune, Bart., L. T. Boustead, A. Bryans, A. O. Devitt, W. Forsythe, Norman W. Grieve, H. Eric Miller, T. C. Owen, The Rt. Hon. Sir West Ridgeway, G. C. B., G. C. M. G., K. C. S. I., Thos. Ritchie, F. A. Roberts, J. Alec Roberts, W. Shakspeare, E. B. Skinner, The Hon. C. H. Strutt, Sir Frank A. Swettenham, G. C. M. G., C. E. Welldon.

The Association will be represented on the general committee of the Rubber Trades Association of London by the following members: J. M. Allinson, F. W. Barker, Charles Emerson, Sir Edward Rosling; and on the Panel of Arbitrators of the Rubber Trade Association of London by the following: Sir A.

Sharp Bethune, Bart., Charles Emerson, Norman W. Grieve, H. K. Rutherford and Noel Trotter.

According to the eighth report of the Council the membership of the Association has increased 105 since the issue of the last report and now totals 767, consisting of 489 companies and 278 individuals as follows:

No.	Companies operating in	Authorized capital. £ Sterling.	Issued capital. £ Sterling.	Acreage owned.	Acreage planted or inter- planted with rubber.
273	Malaya	25,697,792	22,531,828	896,012	502,766
87	Ceylon	14,977,428	12,345,159	357,074	131,725
34	Sumatra	6,493,250	4,980,767	320,834	89,480
30	Java	5,373,850	4,469,602	668,587	75,127
22	S. India and Burma.	2,211,316	1,862,182	103,372	37,739
21	Borneo	2,730,000	2,094,297	176,974	31,248
2	Other countries	84,000	84,000	5,000	2,060

		62,019,896	50,998,902

Note.—There are also 11 company members not owning rubber estates.

In his address the chairman, Charles Emerson, made the following interesting statements regarding the 1916 rubber production, the 1917 estimate and future prospects generally:

The world's output increased in 1916 by some 27 to 28 per cent, an increase due mainly to the additional production of plantation rubber; which rose by nearly 42 per cent as compared with 1915. The approximate production of the world for 1916 was 201,598 tons, of which plantation claims no less than 152,650, Brazil 36,500 and other kinds a modest 12,448. Of this amount the United States took 115,609 tons. Great Britain consumed 26,812 tons, but we imported 75,240 tons, of which, therefore, 48,428 were exported again. Of the plantation production the United States took 85,531 tons and Great Britain imported 57,095 tons, a great deal of which was, of course, re-exported, but there appear to be no figures to show what the actual consumption of plantation in this country was. It is estimated that the value of the plantation rubber which went into the United States during the year was no less a sum than £25,000,000. At the present time when large exports to America are of first importance, this figure is significant. Our commodity is an extremely valuable national asset, and when one remembers that as recently as the year 1910 the total plantation production was but a paltry 8,000 tons, one may, I think, describe the rapid development of the industry as one of the romances of commerce. We owe a great debt of gratitude to the men in the East, who, despite all difficulties and a somewhat alarming shortage of assistants, have supplied the world with so largely increased a crop. The estimated world's production for 1917 is 242,000 tons, say, 192,000 plantation, 37,000 Brazil and 13,000 other sorts.

I shall say but little as to the future. My predecessor, like the cautious Irishman he is, declined the role of prophet, and I do the same. Suffice it to say that, so far, demand has kept pace with supply, and one hopes that it may continue to do so. But of the immediate future it is, I am afraid, safe to say that our difficulties must increase progressively till the end of the war. The problem of transport is a serious one; the problem of arranging for leave for men in the tropics must before very long become acute; and there are other elements of embarrassment which it would serve no useful purpose to detail. That the difficulties and perplexities which confront us may be met and surmounted is our earnest hope, and we may perhaps take heart of grace from the fact that, up to the present, we have come through far better than in the fatal month of August, 1914, the most optimistic of us could have dared to anticipate.

NIPPLES AND TRANSPARENT GOODS.

The Peerless Seamless Rubber Co., Limited, of Richmond, London, claims to have been the first British firm to establish a nipple and valve department after the war broke out. For over two years the company has also turned out large quantities of the finest high grade transparent goods, which have found a market both here and abroad. It is hoped to establish this industry so firmly as to make it impossible for German producers ever to rule the British market again.

The Russian rubber factory, "Prowodnik," will issue 180,000 shares of a par value of 100 rubles, which are offered at the rate of 163½ rubles each.

AN ENTERPRISING SPANISH INDUSTRY.

AN important concern in the Spanish rubber industry is that of Blasi, Sagué & Pallás, of Barcelona, whose factory, pictured here, gives employment to 300 hands in the manufacture of a large variety of goods of hard and soft rubber. In fact, this firm claims to be the first to manufacture hard rubber tubes and syringes in Spain, all such goods having previously been imported.

This firm manufactures an extensive line of hard and soft rubber surgical goods and druggists' sundries, making a widely diversified line of molded goods, packing, hose, mats, tire treads,

FACTORY OF BLASI, SAGUÉ & PALLÁS, BARCELONA, SPAIN.

solid tires and rubber heels, as well as specialties for sugar refineries, breweries and hat factories, and hard rubber parts for telephones and general electric use.

The members of the firm are all practical men, well versed in the manufacture of rubber goods. Mr. Blasi, who has charge of the factory, was superintendent of a leading concern for 30 years, previous to his resigning to form this firm. Mr. Pallás was a traveling salesman for the same house for 10 years. Mr. Sagué has charge of the finances of the concern.

GERMAN RUBBER NOTES.

RUBBER PROSPECTS AFTER THE WAR.

REPRESENTATIVE rubber men of Germany are of the opinion that England intends to make them pay the highest price for rubber and colonial products and are already trying to advance prices. This is to be opposed by resuming the rubber industries as far as is possible, combining for purchases and buying elsewhere until British prices are reduced.

They maintain that artificial raising of prices cannot be maintained in the rubber market, even when the demand is heavy, because of the increasing output. By the time the war is over, all plantations opened up before 1909 will put their full production on the market. Again, when rubber is high, manufacturers will cease using it for many purposes that were profitable when rubber was cheaper, whereas cheap rubber increases the number of modes of its application. If rubber sold at a price between 36 and 42 cents per pound, many new industries now unprofitable would come into existence.

Synthetic rubber is not to be overlooked; although little is heard about it. Chemists are hard at work, and it may be said that wonderful progress has been made in the chemical industry in general. This industry, built up during 60 years of incessant and systematic labor, cannot be wrecked through mere abrogation of German patents.

Many chemical ingredients can be prepared synthetically, though there are some for which substitutes have not yet been found, but other countries than England and her colonies pro-

duce them. It is felt, however, that whatever British feeling may be, the colonies will be unwilling to lose German custom and will not refuse to deal on the same conditions as with other nations.

GERMAN RUBBER INDUSTRY PROFITS.

From German sources it is learned that in spite of the war, German rubber companies have made large profits during the past year. The net profits of 19 representative firms for 1915-16 were 12,000,000 marks, against 10,000,000 marks the year before, but how much of this resulted from the manufacture of goods other than rubber is not stated.

The Continental-Caoutchouc & Gutta Percha Co., Hanover, reports gross profits of 9,451,397 marks for 1916, against 9,729,988 marks the year before; net profits were 7,759,471 marks, against 6,733,135 marks in 1915. A dividend of 30 per cent will again be declared. The value of goods on hand is 6,153,000 marks (year before, 5,253,596 marks), and advance payments for bought rubber amount to 816,021 marks, against 549,002 marks for the previous year.

The following figures for certain insulated wire and cable companies may prove interesting:

The Deutsche Kabelwerke A. G., Berlin-Lichtenberg, records gross profits of 1,340,000 marks for 1916 as against 1,480,000 marks for 1915. Net profits are 620,000 marks as compared with 700,000 marks, and a dividend of 8 per cent will be paid.

The Kabelwerke Duisberg, A. G., booked gross profits of 2,380,000 marks in 1916 and net profits of 1,480,000 marks. The year before, gross and net profits amounted to 2,280,000 marks and 1,620,000 marks, respectively. The dividend is 25 per cent as against 30 per cent the year before.

Norddeutsche Kabelwerke, A. G., of Neu-Köln, Berlin, show net profits of 220,000 marks as compared with 130,000 marks in 1915. This company intends to increase the share capital with 1,000,000 marks, in order to be able to execute larger government orders.

The feeling in Germany prevails that the German rubber industry has acquitted itself creditably of its difficult task in the past year and has seen to it that there was no shortage of articles needed for the war. This year, too, it is expected that military demands will be fully satisfied.

REGULATIONS CONCERNING NIPPLES.

When the government found that dealers were importing large quantities of nipples from Holland and other neutral countries and selling them at exorbitant prices, the stock was requisitioned and stored at a central depot in Berlin and made obtainable only through chemists at the low price of 0.35 mark each.

Whoever wants to buy one, must present the birth certificate of the child for whom it is intended; if the child is under a year old, the applicant is entitled to two nipples. When one is worn out, a second may be bought on returning the old one. No nipples are allowed for children over 12 months old.

A GROUP TO ARRANGE RUBBER SUPPLY.

The Association of Import Trade in Berlin has formed a rubber group to handle the question of the supply of rubber. Several of the largest rubber firms are represented on the committee.

NON-ELASTIC TIRES NOW PERMISSIBLE.

It is understood that the Chancellor of the Exchequer has, after long consideration, cancelled the introduction of the employment of non-elastic tires for motor trucks and trailers. Consequently there is an increased demand for second-hand trucks. But practically the only ones to be had are those with cardan drive, and they, running on rubber tires, are considered a very poor investment in these days of German rubber famine. The cancellation, therefore, does not appear to have greatly diminished the difficulties of transportation, due largely to the lack of rubber.

Rubber Planting Notes.

RUBBER IN BORNEO.

EIGHTEEN leading companies, with a total authorized capital of £2,250,000 and subscribed capital and loans amounting to £2,111,000, are at present operating in the British North Borneo Co.'s territory. Two large tobacco companies have also planted 1,000 acres of rubber while several Chinese and Japanese own considerable properties.

The Mycologist and Director of Agriculture reports that the area under rubber in British North Borneo is 29,827 acres, not including estates of less than 100 acres. The area in full tapping is 9,806 acres, but 570,000 trees are being tapped over areas not yet in full tapping, equivalent to 4,400 acres at the rate of 130 trees per acre. The total area under tapping is, therefore, approximately 14,000 acres. At the end of 1915, 9,636 laborers were employed on the estates, as follows: 4,065 Chinese, 3,521 Javanese and 2,050 other races, chiefly natives of Borneo. The export of plantation rubber in 1915 amounted to 1,050 tons, against 613 tons in 1914.

The land concessions of the principal companies are practically freehold—999 years' lease, free of quit rent or cultivation clause of any kind. The government has undertaken not to impose an export duty on plantation rubber for the next 40 years.

Three rubber companies are operating in the British protectorate of Brunai, while in the Sarawak territory the Sarawak Rubber Estates, Limited, has issued capital of £200,000 and a planted area of 3,545 acres, which yielded 420,212 pounds of rubber in 1915. The estimate for 1916 is 565,339 pounds. Besides these companies, there is also one in Lawas.

In Dutch Borneo the four principal companies have a combined issued capital of £359,615, and a planted area of 4,593 acres under *Hevea*, and 1,865 acres under *Ficus*. In the south-east of the island, the Hayoep Rubber Estates' production in 1915 was 346,681 pounds of rubber, at a cost of 1s. 4½d. per pound, and a dividend of 10 per cent was paid. The estimated crop for 1916 is 451,000 pounds.

COSTS AND YIELDS OF PARA IN UGANDA.

G. Brown, F. L. S., of the Kivuvu estate, Uganda, submits some interesting details concerning the yields and costs of Para rubber on his and several other plantations.

Tapping at Kivuvu commenced in 1914 with 6,000 trees and was conducted over a period of 7 months. The following year the number of trees was increased by 4,000, and in 1916 by 2,000 more, bringing the total to 12,000. The methods followed were the basal V and alternate day tapping on one-quarter section of the tree only. For the last two years, operations extended over 9 to 10 months. The average yields per tree of dry rubber were:

	Ounces.
1914	11.5
1915	11.5
1916	11.5

The total yields of dry rubber in 1915 and 1916 were 7,125 pounds and 16,700 pounds, respectively.

Reports in 1915 from the Government Farm at Kakumiro and at Entebbe Botanic Gardens show that on the former the yield per tapping on the half-herring-bone system was 0.13 ounce and 0.1 ounce on the basal V method.

At Entebbe Gardens 535 trees yielded 1,132 pounds, or an average of 213 pounds per tree. Tapping here was very irregular, only 60 trees being tapped in some months.

The cost of production at Kivuvu has diminished year by year, just as the crop has increased, so that the comparative costs per pound of rubber over the three years work out as follows (values being stated in United States currency):

	1914.	1915.	1916.
Upkeep of area	8.6	3.9	2.7
Tapping	6.3	5.1	3.7
Curing and packing	1.5	1.3	1.4
Upkeep of tools	0.3	0.3	0.3
Freight Kivuvu to London	3.5	4.5	4.5
Management	2.0	2.0	2.0
Landed in London	22.2	17.1	14.6
Market and selling charges	3.0	3.0	3.0
Cost to place in hands of purchaser	25.2	20.1	17.6

It is interesting to compare the 1915 cost and sale prices of rubber from Kivuvu with those for Malayan rubber of the same year.

Estate	Production (in pounds)	Cost per pound in cents.	Sold in London.
Kivuvu, Uganda	7,125	17.1 (to London)	52.6
Kamuning, Perak	668,227	21.5 (on plantation)	53.5
Singapore, Para	359,725	30.0 (f. o. b.)	52.9
Tremelbye, Selangor	543,356	25.0 (f. o. b.)	52.7

From these figures, it will be seen that the cost of production at Kivuvu was less than on any of the three Malayan estates, a fact all the more striking since the crop from the former was so very small in comparison with that from the latter, while the prices obtained do not differ greatly for the four estates.

It is estimated that an acre, planted with 108 trees, may be safely capitalized at £20. The time it takes a rubber estate to become remunerative may be judged by the Magigye estate. In 1911 a certain area was planted, with one-year-old seedlings. In 1916, 50 per cent of these were ready for tapping and gave an average yield of 6¼ ounces per tree, which put that area on a remunerative basis.

On the whole, it would appear that the prospects for rubber cultivation in Uganda are very favorable. Kivuvu, for instance, gave profits of 16 per cent in 1914; 25 per cent in 1915, and 54 per cent in 1916.

CEYLON RUBBER EXPORTS, 1916.

The report of the Ceylon Chamber of Commerce for the half year ended December 31, 1916, gives the total exports of rubber from Ceylon for the year 1916 as 54,698,729 pounds at an average price of 1.79 rupees, against 46,566,187 pounds at an average of 1.65 rupees in 1915.

The distribution for 1915 and 1916 was as follows:

	1916.	1915.
United Kingdom	23,812,305	25,183,748
United States	27,249,589	18,607,691
Canada and Newfoundland	6,720	392,495
Australia	797,091	964,697
France	1,803,217	698,992
Russia	293,674	332,200
Italy	347,632
Other countries	389,501	386,364
Totals	54,698,729	46,566,187

It will be noticed that during 1916 the United States became Ceylon's biggest customer, and that French and Italian purchases were greatly increased. Canadian consumption almost ceased. Average prices fluctuated from 2.78 rupees per pound early in January to 1.34 in August and up to 1.79 late in December.

PLANTATION RUBBER IN CEYLON.

According to the latest reports from Ceylon, the area devoted to the cultivation of rubber is 251,000 acres, an increase of 10,500 acres over 1915. The rubber industry in Ceylon has advanced by leaps and bounds. In 1905 the area under *Hevea* was 40,000 acres; one short year later this had expanded to 104,000 acres; now, within ten years, these figures have more than doubled, and show that over one-third of the total culti-

vated land of the island is under rubber. Kelani Valley and Kalutara are the most important rubber districts, the areas being 53,235 and 50,193 acres, respectively. Few new plantations have been opened and it is hardly expected that any considerable enterprises in this direction will be undertaken in the immediate future.

The exports of rubber for 1916 again showed an increase, being 54½ million pounds, which is 8 million more than for 1915. America again headed the list of buyers with 27 million pounds, or half of the total shipments. The United Kingdom came second, having bought about 23½ million pounds.

Whereas Ceylon pale crêpe rubber compared very favorably with that from other sources, Ceylon ribbed smoked sheets are often over-smoked and not too well graded.

NODULES IN THE CORTEX OF HEVEA TREES.

This is the subject of an investigation by G. Bryce, B.Sc., assistant botanist and mycologist, the results of which are reported in Bulletin No. 28 of the Ceylon Department of Agriculture. These swellings on *Hevea* stems, not the result of tapping wounds, and often termed "burrs," take the form of small woody bodies of varying shape and size. Although comparatively rare in young trees, they appear more frequently in trees which have been tapped for some time. In their younger stage nodules may cause only a slight external swelling, but after several years' growth they give a characteristic gnarled, knotted appearance to the stem and may interfere with tapping or even render it impossible in trees badly affected.

Of their development, and ideas regarding causes Mr. Bryce writes:

About the cause of the production of nodules much difference of opinion prevails; several explanations have been advanced, but none so far has found general acceptance. A nodule at first is a little isolated body of woody tissue lying in the cortex usually about the size of a "pea" when first observed, and easily "shelled out" with a penknife. There is little to indicate its presence at this stage, occasionally a small protuberance or a slight cracking of the bark externally. In later stages these "peas" increase to the size of a "hen's egg"; or many "peas" fuse together and form an irregular mass; or, again, large sheets of woody tissue are produced. At the same time growing points originate, which grow inwards and unite with the stem wood, and thus ultimately the nodular masses become connected with the stem at many points. As the nodules grow larger the stem becomes gnarled; the cortex cracks and latex oozes out; finally, the entire stem to a height of 5 or 6 feet from the ground is affected. In this condition it is impossible to carry on tapping, and the tree is useless.

Mr. Bryce finally summarizes the results of his investigations as follows:

(1) Nodules are produced in the cortex of *Hevea Brasiliensis* as the result of an alteration in the latex vessel content.

(2) This alteration has not been connected with the attack of any parasitic organism, but appears rather to be due to physiological changes in the latex.

(3) The tendency to suffer alteration in the latex vessel content appears to be confined to certain individual trees which have a predisposition to develop this condition.

(4) Four types of nodule have been distinguished:

(a) Nodules formed round altered latex vessels.

(b) Nodules formed round lesions in the cortex into which latex has oozed and coagulated. May occur in *Hevea* tree.

(c) Nodules formed round areas into which latex has oozed and coagulated; the coagulated latex occupies the intercellular spaces without lesion of tissue. May occur in any *Hevea* tree.

(d) Nodules formed under unknown conditions round areas of cortex from which latex may be entirely absent. Rare.

(5) Globular shoots formed by the subsequent growth of latent buds after these have lost their connection with the stem occur in both tapped and untapped trees. They are distinguished from nodules by the absence of a core, and they never form large masses of woody tissue as nodules do.

(6) Nodules of (a) type do not occur on untapped trees.

(7) Nodules occur on *Hevea* in its native habitat in Brazil; and in tropical America and the Eastern tropics where it has been grown in plantations.

(3) The percentage of trees which develop nodules is very small.

(9) Tapping appears to induce nodule formation in predisposed trees.

(10) This abnormal condition is apparently not infectious.

MODE OF OCCURRENCE OF HEVEA LATEX VESSELS.

The distribution and mode of occurrence of latex vessels in the cortex are obviously of great importance as factors influencing the amount of latex obtainable by tapping. Since Scott's investigations in 1885 many other rubber experts have made important researches, but up to the present no record exists of any investigations into the number of cylinders at different heights of the stem in mature trees, or of any seasonal variation in these numbers. In order to elucidate this and several other obscure points in connection with the subject a more detailed investigation than any hitherto was undertaken by G. Bryce, B.Sc., and L. E. Campbell, B.Sc., F.I.C., respectively assistant botanist and mycologist, and rubber research chemist of the Ceylon Department of Agriculture. Several untapped trees planted in 1905 at the Experiment Station, at Peradeniya, were chosen, and the results were confirmed by examination of trees growing on plantations in several districts of Ceylon.

The findings, as stated in Bulletin No. 30, follow:

(1) Considerable variation occurs in the number of stone cells in the cortex of different trees. There is consequently variation in the degree of disintegration of the latex vessels.

(2) There was evidence of the diminished production of latex vessels in February and March, when the trees were changing leaf.

(3) The number of rows of latex vessels in the cortex decreases with the height above ground level.

(4) The distance between the rows of latex vessels did not usually increase in proportion to the distance from the cambium. The average of the distances between the rows was approximately 0.2 millimeters.

(5) Well-defined cases of connections between neighboring rows of latex vessels were not observed. Several examples of bifurcation of rows were, however, noted.

(6) The course of the rows may not be invariably regular and parallel. Sometimes the rows undulate, and the same neighboring rows vary in distance apart at different points.

(7) In general the thicker the cortex the more rows of latex vessels did it contain, though the increase was not great.

(8) The distance from the cambium of the first interrupted row was approximately 1.5 millimeters; this represents the inner cortex or food-conducting tissue of the tree, and should be left untapped.

THE SITUATION IN MALAYA.

By a Special Correspondent.

A RATHER warm discussion of the question of granting land to aliens took place at a recent meeting of the Planters' Association of Malaya, held at Kuala Lumpur, Federated Malay States.

It was maintained that although from the point of view of the local government it would be unbusinesslike to refuse capital of any sort directed to the opening up of land, planters, as such, and as Britishers, objected to a "lot of aliens, be they Americans, Danes or what not," coming into the country at a time when circumstances demanded British money and control elsewhere. Past experience had taught what difficulties were to be expected from allowing aliens to monopolize business, and it was especially undesirable that German capital should enter, which would undoubtedly result from the admission of American capital. Meanwhile, 25,000 acres of land had already been granted to an American concern.

The question was then raised whether, if Americans were allowed to open large plantations and to develop them at express speed the government would order that they import their own labor.

It was finally agreed to forward to the Chief Secretary of the Federal Council an expression of the Association's objection to the "alienation of land at a time when British capital and superintendence is unavailable for opening up such land."

DEATH OF A CHINESE RUBBER PLANTER.

The death of a prominent Chinese, Towkay Loke Yew, of Kuala Lumpur, is announced. The deceased, who was 72 years old, came to Malaya about 60 years ago, and began his prosperous career as shop assistant. He possessed extensive properties, three rubber estates, coconut groves, cement works, oil mills, etc., and held large interests in several enterprises, such as the Malayan collieries, the Straits Trading Co., the Straits Steamship Co., Perak and Selangor, all of which owed much of their development to his activities, and his services were duly recognized in both China and Great Britain. The University of Hongkong bestowed on him the honorary degree of LL.D., and England created him a Companion of the Order of St. Michael and St. George. Kuala Lumpur honored him by turning out in large numbers to attend the funeral.

IMPORTS OF RUBBER MANUFACTURES.

The importation of manufactures of rubber forms a significant part of the trade of the Malay Peninsula. The total imports into Straits Settlements for four years were: 1913, £201,821; 1914, £194,913; 1915, £276,924; 1916 (nine months), £212,025.

Tires, which were not specially mentioned before 1915, have since been given a special heading as they now form the most important part of the manufactured rubber imports, the value for nine months in 1916 being £192,620. It is interesting to note that whereas the amount supplied by Japan before the war was about one-half of that from the United Kingdom, it is now double.

THE SITUATION IN THE DUTCH EAST INDIES.

By a Special Correspondent.

INTERNATIONAL EXHIBITION AT SOURABAYA.

It is proposed to hold an international exhibition at Sourabaya, Java, from May 1 to November 1, 1919, or as soon as possible after the conclusion of peace. This exhibition, which will be known as the *Algemeene Nederlandsch-Indische Tentoonstelling Soerabaya* (called in brief the A.N.I.T.A.), will be a general exhibition of agriculture, cattle-breeding, fisheries, commerce and industries, in the Netherlands East Indies.

Although the exhibition is a private one promoted by prominent residents of Java, the government has officially recognized its aims and objects by appointing a commissioner, who is also one of the committee of promoters, and by authorizing the acting director of the Department of Agriculture, Industry and Commerce to hold a seat on the Advisory Board. A money grant is also being given by the Municipality of Sourabaya in aid of the expenses.

The exhibition will be held during the dry season and coincident with the completion of the new harbor works at Sourabaya—the largest and most modern in the Dutch East Indies. A special section will be devoted to agricultural implements and electricity in the widest possible sense of the terms, and special buildings will be set apart to meet the requirements. The exhibition grounds will occupy about 75 acres. This opportunity will doubtless be utilized to the full by American and Japanese exhibitors.

INTERNATIONAL RUBBER CONGRESS AWARDS.

The jury of the International Rubber Congress and Exhibition at Batavia, 1914, has made the following awards:

- I. Planters' Association of Malaya Cup—for the best commercial sample of *Hevea* rubber: Highlands and Lowlands Estates, Klang.
- II. Grenier's Rubber News Trophy, presented by the owner of "Grenier's Rubber News," Kuala Lumpur, for the best commercial sample of *Hevea*-rubber produced in the Dutch East Indies: Tjilentab, Tjibadak Estates.
- III. Van Laer Cup, presented by H. van Laer, superintendent of estates at Pematang Siantas, for the best commercial sample of *Hevea*-rubber produced in the Federated Malay States: F. M. S. Rubber Co., Kuala Lumpur.

- IV. Medals, presented by the Rubber Growers' Association, London, for the three best commercial samples of smoked sheet:

Gold Medal: Highlands and Lowlands Estates, Klang, F. M. S.

Silver Medal: Federated Malay States Rubber Co., Kuala Lumpur, F. M. S.

Bronze Medal: Yamseng Estates, Perak, F. M. S.

Commercial rubber means rubber produced from rubber trees grown on any one estate, out of which at least 5,000 kilos of rubber have been forwarded for sale in one of the rubber markets during the first half of the year 1914.

TRANSPORTATION OF COOLIES.

The contract between the Deli planters of Sumatra and the *Kon. Paketvaartmaatschappij* concerning the transportation of coolies from Java to Deli and *vice versa*, has expired. By the new contract, this shipping company can no longer be held responsible for the coolies, and in case of desertion, indemnification cannot be claimed. On the other hand, free passage, second class, is given to a European supervisor, as well as fourth class to one overseer over every 100 coolies.

THE CENTRAL RUBBER STATION OF JAVA.

This comparatively new institution, opened at Buitenzorg in September, 1915, was founded to help planters to find new and improved methods of preparation and to turn out a product of excellence and uniformity.

The chief problem that the director, Dr. O. de Vries, and his assistants are trying to solve is the difficult one of fixing a standard method for inspecting and judging rubber that can be applied to all institutions.

The establishment began with a capital of about 41,000 florins [\$16,400], and is well supported by members and others interested in its prosperity. It is well equipped with the necessary instruments and machinery, including hydraulic and autoclave presses, Schopper, punch, mixing and crêping machines, calender and vulcanizing-pan.

In a recent report covering his work in an advisory capacity on the East Coast of Sumatra in 1915 and 1916 Dr. Vriens takes up preparation of crude rubber, water supply, oxidation prevention, coagulants and anti-coagulants, marking to prevent theft, and diseases and pests.

He emphasizes the fact that stains in both sheet and crêpe are often the result of bad water supply, particularly when containing iron oxide. Filtering through alum or fiber of the areng palm works an immediate improvement.

Oxidation with consequent graying of the latex and purpling of the surface of the coagulum can be avoided by the use of sodium sulphate or bisulphate in the preparation of crêpe and unsmoked sheet, but this is superfluous for smoked sheet. These are the principal anti-coagulants now used in latex cups and cans.

In coagulation it is desirable to employ a minimum of acetic acid, 0.5 to 1 grain per liter of latex usually being sufficient.

Coconut water or coconut milk may be used as a coagulant if obtainable at a low transportation cost.

To prevent theft, block and sheet rubber are now marked in ways which do not impair the value. This is also desirable in the case of thin crêpe, but no satisfactory method has yet been found. Possibly a harmless color mark may be devised.

The usual measures for disease prevention are encouraged, particularly removal of creepers and moss from the trunks of trees and clearing away as far as possible all wood and roots on or in the ground so that insects will be deprived of all opportunity to lodge and breed.

Contrary to the opinion of T. Petch, carbolineum is regarded an excellent remedy in case of disease, provided the mixture with water be not too strong and thoroughly emulsified by shaking at the time of use.

THE SITUATION IN BRAZIL.

By a Special Correspondent.

ON March 6 the one hundredth anniversary of the first Brazilian republic was celebrated throughout the country.

In the year 1817, several prominent men of Pernambuco, tired of the royal Portuguese yoke, conspired to overthrow the existing form of government. Twice their intentions were betrayed to the colonial governor, who, the first time, treated the matter as a joke. The second time, however, he gave orders to arrest the conspirators. This was the sign for revolt. The prisons were opened and the governor fled. A federal republic was formed which lasted exactly 74 days. Then the royalists routed the republicans, shot their leaders and reestablished the monarchical government. This revolution was the first step leading to the final establishment of the present republican form of government, and the event was naturally commemorated with great enthusiasm. In Belem, the celebration by the *Associação da Imprensa do Para* took place in the *Theatro da Paz* and was presided over by Dr. Lauro Sodré, governor of the state of Para.

ATTACKS ON GERMAN PROPERTY.

Demonstrations of enthusiasm for the Allies and of hatred towards Germans were not lacking once Brazil had broken relations with Germany. Not always have the people been satisfied to give vent to their feelings in shouts. At Porte Alegre, a mob, infuriated by the German proprietor of a hotel who lost his head and fired at a passing car, wounding one or two of the occupants, sacked and burned the hotel and many German buildings, and broke the windows of all houses suspected to harbor Germans. Pelotas and Rio Grande do Sul were only saved from similar proceedings by the timely arrival of soldiers.

Naturally, Germans are beginning to feel uneasy, and quite a number have gone to Santa Catherine where they no doubt feel safer, as they represent the majority of the population there.

SHIPMENTS AND THE RUBBER BLACKLIST.

Judging from the latest reports, the blacklist on the Amazon has been a great success. It came into effect here on March 29, 1916, from which date to March 30, 1917, crude rubber was exported to the amount of 34,424 tons. Of this, 19,631 tons, or 57 per cent, went to allied and American firms, 12,741 tons, or 37 per cent, to Brazilian and Portuguese firms, and only 2,052 tons, or 6 per cent, to enemy and blacklisted firms.

The distribution by shipments was as follows:

	Tons.	Percentage.
In British vessels to Europe.....	12,919	37.5
To New York	12,797	37.2
In Brazilian vessels to New York.....	8,708	25.3
	34,424	100.0

Enemy shipments were shipped by the "Lloyd Brasileiro" and have increased lately, 480 tons having been shipped between February 6 and March 30, as against 597 tons by British and American firms and 680 tons by Brazilian and Portuguese. In this connection it is significant that the Lloyd apportions space to shippers as follows: 39 per cent to Brazilian and Portuguese firms, 34 per cent to allied and American and 27 per cent to German firms.

Nevertheless, a comparison of exports for 1913-14 and for the 12 months, March, 1916-April, 1917, demonstrates very satisfactorily the decrease for German firms and the increase for allied and neutral firms.

	Tons.	
	1913-14.	12 months ending April, 1917.
German firms	18,264	2,052
Allied and American	11,702	19,631
Brazilian and Portuguese	7,194	12,741
Totals	37,160	34,424

The most striking fact indicated by the above table is the remarkable growth of Portuguese and Brazilian exports since the war.

STORAGE CHARGES ON RUBBER IN TRANSIT.

The *Associação Commercial* is endeavoring to reduce the high storage charges assessed at the port of Para for rubber in transit.

An arrangement has already been made with the port of Para by which 1 per cent of the dues covered in the second month and 3 per cent of those in the third month will be restored.

This arrangement will hold while the actual difficulty of transportation lasts and depends on the orders of the Minister for Traffic to the Inspector of the port of Para.

The *Associação* has already informed the Minister of the terms of the agreement and is now awaiting developments.

FLOODS IN BRAZIL.

Within the last four years the state of Ceara has suffered from three grave catastrophes. The year 1913 saw the country torn by political strife. Hardly had this disturbance ceased, when drought set in, forcing thousands of the inhabitants to leave

A BRAZILIAN *Seringueiro* COLLECTING LATEX

their homes and seek relief in the neighboring states. Towards the winter, many returned, only to experience the heaviest flood that visited the land for years. The sufferings of the people are said to be severe in the extreme and everything possible is being done to help them.

The neighboring state of Maranhão has also suffered from floods, the Itapicuru and Mearim rivers having overflowed.

INADEQUATE TELEGRAPH SERVICE.

So many complaints are made about the radio-telegraph service of the Amazon, that those in authority seem at last to be awakening to the fact that something must be done. Indeed, it has been suggested to abolish this system altogether and make use of the facilities offered by the Amazon Telegraph Company instead. Naturally, this is anything but pleasing to the *Associação Commercial do Amazonas*, which, in conjunction with the Federal Government, undertook to maintain the radio-telegraph

service. They claim that this service should be maintained and supported, and point out that though delays occur, it is a convenience where speedy delivery is not essential. When, however, papers publish letters signed by a number of merchants of the Acre region, in which it is declared that radiograms intended to advise the dates on which vessels from Belem or Manaus are due at certain ports, arrive later than the boats, one is inclined to question the practical value of this vaunted convenience.

PLANTATION RUBBER IN BRITISH GUIANA.

THE rubber-planting industry of British Guiana is progressing slowly but steadily, despite the many disappointments usually experienced in new ventures in tropical agriculture. Reports from inspectors at various rubber-producing centers show that farmers and planters have extended their areas under *Hevea* and are continuing to do so. In some cases, however, small areas had to be abandoned owing to the unfitness of the soil for its cultivation; also certain areas planted with *Sapium* rubber were discontinued. This accounts for the fact that the final totals of the 1915 report show a small decrease in acreage.

PLANTED ACREAGE.

The following figures are interesting as illustrating the general growth of the industry for the period 1910-15.

	Areas Under Rubber.			
	1910.	1913.	1914.	1915.
Demerara acres	579	1,859	2,196	2,229
Essequibo	1,129	2,142	2,206	1,854
Berbice	30	501	560	693
Totals	1,738	4,502	4,962	4,686

The report from the Botanic Gardens, Georgetown, stated that no foreign seeds had been imported in 1915, as there had been sufficient local seed to meet the demand for plants. Altogether, 21,846 plants were sold during that year.

RAINFALL.

The total rainfall for 1915 was satisfactory, having been 9.53 inches more than in 1914.

The following table, taken from the 1915 Report of the Department of Science and Agriculture, gives the rainfall over 53 years:

RAINFALL AT GEORGETOWN AND THE BOTANIC GARDENS, 1846-1915.													
Period.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Totals.
1846-1856.....	6.84	5.82	7.25	7.41	14.05	13.91	11.09	8.00	2.61	2.46	5.60	10.71	91.75
1857-1879.....	6.55	3.58	5.59	6.39	12.58	14.17	10.01	7.05	4.81	2.64	4.22	14.77	92.36
1880-1889.....	6.48	6.67	4.57	6.52	11.44	11.58	9.95	5.76	2.24	1.79	5.45	11.32	83.77
1890-1899.....	11.52	8.08	8.19	7.31	11.08	13.22	11.77	5.79	2.87	2.81	5.89	13.07	101.60
1900-1909.....	7.61	5.87	9.43	7.83	12.30	11.49	10.00	6.55	5.96	2.21	5.04	11.29	95.65
1910.....	8.06	7.95	10.00	7.81	10.81	14.74	11.17	14.76	6.60	2.72	3.76	3.00	101.46
1911.....	10.17	9.13	14.04	8.43	11.13	12.08	9.63	4.00	5.55	4.02	2.30	2.41	87.89
1912.....	1.23	.46	1.28	6.76	9.08	8.21	11.24	8.17	1.57	1.89	4.03	16.45	69.87
1913.....	18.18	2.41	7.64	2.69	5.00	9.67	13.71	5.80	4.29	3.96	2.64	15.03	90.42

1915.....	6.41	13.38	.95	5.73	17.65	9.16	8.47	5.06	.66	1.20	4.52	5.83	79.02
Means 53 years.....	7.63	5.99	6.94	7.00	12.27	12.42	12.44	6.67	3.53	2.44	4.99	11.56	93.88

DISEASES AND PESTS.

The plantations suffered to a certain extent from diseases, the South American leaf disease (*Fusicladium macrosporum*) having been the most prevalent. Brown root disease (*Hymenochaete neriis*) and die-bark (*Thyridaria tarda*) also attacked the trees. Root disease (*Fomes semitostus*), well known in the East, was observed here for the first time.

Fortunately no new serious insect pests were remarked at the Government Rubber Station, Issorora, N. W. D., a species of Cushi ant [*Atta (Acromyrmex) octospina*, Reich] was seen removing and carrying away material from the layer of tissue immediately overlying the cambium of recently tapped trees, causing considerable damage to some trees. This ant has not been met with in other parts of the colony.

Disease has kept away from the Government Farm, Onderneeming, in quite a remarkable manner, consequently the *Heveas* there are in good condition. The accompanying table shows

the yields of experimental tapping of 200 trees averaging seven years of age.

	Number of Tappings.	Dry Rubber. Ounces.	Rainfall. Inches.
1915.			
August	21	420½	2.64
September	30	744½	2.95
October	31	864	1.82
November	27	873	7.68
December	27	975½	8.32

Taking the four completed months September to December the yield has been 3,457 ounces, equal to, say, 216 pounds, or 648 pounds for 12 months, showing a yield of 3½ pounds per tree per annum.

BALATA.

Several bullet tree seedlings of balata, found growing in the forest behind this station, were dug up and planted in the cultivation in 1911. These trees reached a height of 18 feet during the four years from 1911-1915 and are in good condition.

In connection with balata, it is interesting to learn that experiments to determine the composition of Guiana balata, about which little appears to have been reported, were conducted at the Government Laboratory. Samples from British and Dutch Guiana were submitted to analysis, determinations being made of moisture, resin, crude proteids, other vegetable impurities, mineral matters and gutta. It was found that in the British Guiana samples water varied from 2.5 to 7.1 per cent, resin from 36.4 to 39.6 per cent, crude proteids from 2.6 to 6.3 per cent and other vegetable impurities from 4.2 to 11.7 per cent, mineral matters from .5 to 1.1 per cent, whilst the valuable constituent, the gutta, varied from 40.1 to 52.1 per cent. From the results of the examinations coupled with the history of the samples it was deduced that normal British Guiana balata should contain 45 per cent of gutta and 38 per cent of resin, any proportion of the latter above 38 per cent being regarded as an impurity. It was assumed that on the water-free basis less than 44 per cent of gutta, or resin in excess of 42 per cent, or total impurities in excess of 15 per cent, indicates, as the case may be, either low-grade balata, such as dabray bottoms, or admixture with latex other than that of true balata.

A FRENCH COLONIAL CONGRESS.

A colonial congress, organized by the *Union Coloniale Française* and aiming to bring the home manufacturer in closer touch with the colonial producer, is being held at Paris this month.

A special section devoted to rubber is presided over by M. Jumelle, professor of the Faculty of Sciences of Marseilles. He has distributed among those interested a circular requesting replies to such questions as:

- (1) In what proportion can wild rubbers from Africa, America (not Para), Tonkin and Java, be used in rubber factories?
- (2) What kinds are the most satisfactory?
- (3) How does Brazilian rubber differ (from an industrial viewpoint) from Ceylon or Malayan plantation rubber?
- (4) Which of the three plantation rubbers—Ceylon, Malay Peninsula, Java—is to be preferred?
- (5) What form—crêpes, biscuits, blocks—is preferred?
- (6) How does Cochinchina rubber compare with other plantation rubbers; also the value attached to Ceara, *Funtumia* and *Castilla* plantation rubber from French colonies as compared with that from other countries?

The result of the questionnaire will doubtless prove valuable.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED APRIL 17, 1917.

- NO. 1,222,614.** Solid rubber tire. F. H. Field, Passaic, N. J.
 1,222,639. Resilient shoe heel lift. G. H. Lewis, Elyria, Ohio.
 1,222,683. Respirator. D. K. H. Schumann, Hamburg, Germany.
 1,222,703. Elastic fabric spool protector. J. White, Pasadena, Calif.
 1,222,729. Repellent for pneumatic tires. F. S. Bryant, Reading, Mass.
 1,222,735. Waterproof patch for wearing patch. W. C. Coleman, Portland, Oreg.
 1,222,825. Pessary. H. W. Walter, Peoria, Ill.
 1,222,906. Tire tread. A. W. Torkington, London, England.
 1,223,049. Cushion tire. O. J. Hicks, Centerburg, Ohio.
 1,223,179. Tire valve. W. A. Keller, New York City.
 1,223,204. Airless tire core. C. B. Reynolds, Sausalito, Calif.
 1,223,312. Demountable rim. L. M. Cooper, Detroit, Mich.
 1,223,344. Tire valve. A. B. Norwalk, New York City.
 1,223,345. Tire valve. A. B. Norwalk, New York City.

ISSUED APRIL 24, 1917.

- 1,223,368. Pneumatic arch support. R. S. Carling, Los Angeles, Calif.
 1,223,450. Soft rubber denture. G. L. Van Allen, Prince Bay, N. Y.
 1,223,501. Means for holding demountable rims on wheels. S. R. McKay, Cleveland, Ohio.
 1,223,537. Rubber-faced mat or rug. F. W. Tully, Brookline, Mass.
 1,223,635. Tire rim. H. Stinemetts, The Dalles, Oreg.
 1,223,703. Inkstand with a collapsible air bag. F. La Chapelle, Erie, Pa.
 1,223,716. Tire valve cap. W. Miller, Los Angeles, Calif.
 1,223,724. Pneumatic non-skid tire. F. C. Otto, Worcester, Mass.
 1,223,727. Solid tire. M. C. Overman, New York City.
 1,223,776. Armored pneumatic tire. T. Duysens, Maastricht, Netherlands.
 1,223,788. Combined cushioning and fastening device for solid tires. A. Hauschild, Akron, Ohio.
 1,223,827. Inner tube. E. M. Pearson, Chicago, Ill.
 1,223,863. Ventilated raincoat. S. and F. Freedman, Chelsea, Mass.
 1,223,900. Detachable rim. C. D. Paxson, Cleveland, Ohio.
 1,223,963. Vaginal douche. H. Gollomb, New York City.
 1,224,012. Demountable rim. G. H. Parks, Lomax, Ill.
 1,224,039. Protective mask having elastic strips for attaching. S. Synoblyuk, Myrnam, Alberta, Canada.
 1,224,103. Blow-out protector for tires. T. W. Carter, Silver City, N. Mex.

ISSUED MAY 1, 1917.

- 1,224,141. Typewriter device comprising a piece of stretchable material to receive the blows from the keys. J. J. Cohen, New York City.
 1,224,154. Garter with an elastic section. H. J. Esser, New Orleans, La.
 1,224,248. Tie patch. W. L. Wayrynen, Lake Norden, S. D.
 1,224,511. Demountable rim and felly band. C. D. Stephens, assignor of one-half to J. A. Bachman—both of Austin, Tex.
 1,224,637. Demountable rim. E. Henry, Albert Lea, Minn.
 1,224,638. Hose coupling. H. H. Hewitt and C. H. Paenke, Jr., both of Buffalo, N. Y.
 1,224,666. Demountable rim. C. R. Ragsdale, St. Louis, Mo.
 1,224,706. Rim for vehicle wheels. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,224,753. Metallic spring-actuated mechanism for rubber tires. E. G. Loeser, Roxbury township, Dane county, assignor to Cantilever Airless Tire Co., Milwaukee—both in Wisconsin.
 1,224,803. Tire protector. E. S. Stalker, Hallstead, Pa.
 1,224,830. Vehicle wheel rim. R. W. Ashley, New York City, assignor of one-half to F. Oberkirch, St. Marys, Pa.

ISSUED MAY 8, 1917

- 1,224,920. Vehicle tire. I. M., N. R. Hass and B. V. Myers, assignor of one-fourth to G. Hass—all of Dayton, Ohio.
 1,224,992. Eraser for attachment to pencils. F. Ziemer, Freeport, N. Y.
 1,225,023. Annular article comprising an inflatable open collar. H. M. Foote, assignor to The Mechanical Rubber Co.—both of Cleveland, Ohio.
 1,225,042. Cushion tire for vehicle wheels. H. M. Lambert, Portland, Oregon, assignor to Lambert Multiplus Co., Phoenix, Ariz.
 1,225,126. Retaining clamp for demountable rims. L. B. Harvey, W. Hornbeck, and B. Binger—all of Sacramento, Calif.
 1,225,181. Pneumatic tired vehicle wheel. J. C. Schleicher, Mount Vernon, N. Y.
 1,225,183. Solid resilient tire and wheel. W. D. Seal, Piedmont, Mo.
 1,225,286. Packing comprising a woven metallic fabric embedded in rubber. E. J. Sweetland, Montclair, N. J.
 1,225,341. Surgical device. O. Lederer, Vienna, Austria.
 1,225,344. Pneumatic tire and method of making same. I. S. McGiehan, Mount Vernon, N. Y.

- 1,225,455. Pneumatic shoe sole. R. Marabini, New York City.
 1,225,459. Wheel tire. A. S. Mauk, Orangeville, Md.
 1,225,557. Demountable rim. A. Allgrunn, Dover, N. J.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

ISSUED APRIL 4, 1917.

- 17,306 (1915). Emulsifying apparatus comprising an inflatable ring. Maypole Margarine Works, Southall, Middlesex.
 17,357 (1915). Rubber in apparatus for playing a game. F. Uffelmann, "Brooklyn," Tavistock Road, South Woodford, Essex.
 17,449 (1915). Tread band for tires. J. C. Barker, 14 St. Mary Axe, London.
 17,520 (1915). Method of securing rubber soles and heels to boots. J. Walton, 101A Great Western street, Moss Side, Manchester.
 103,570. Tire attachment to rims. Sir W. G. Armstrong & Co., Elswick Works, Newcastle-upon-Tyne, and G. Beveridge, Greenhow Terrace, Scotswood Road, Newcastle-upon-Tyne.
 103,605. Non-skid tire chains. L. P. Reeder, 257 Bay street, Hamilton, Ontario, Canada.
 103,625. Gas cartridge for inflating life belts, pneumatic tires, footballs, india rubber toys, etc. W. G. Brokaw, 41 Boulevard Haussmann, Paris.
 103,642. Patch for tires consisting of a disk of rubber. Marvel Accessories Manufacturing Co., 1220 West Sixth street, Cleveland, Ohio, U. S. A.
 103,660. Pneumatic tire. M. E. J. A. Cuypers, Cuypersstraat, Roermond, Holland.
 103,692. Aircraft device comprising rubber-coated fabric. T. S. Sloper, Devizes, Wiltshire.
 103,694. Pneumatic tire. A. A. Crozier, 3 Woodquest avenue, Herne Hill, London.

ISSUED APRIL 12, 1917.

- 17,675 (1915). Soft rubber nipple shield. H. L. Thomas, 2637 Balacava street, Vancouver, British Columbia, Canada.
 17,779 (1915). Rubber heel with wooden lifts. V. Buckland, British Wood Heel Co., Windmill Road, West Croydon, Surrey.
 17,795 (1915). Non-skid tread for twin tires. Schneider et Cie, 42 Rue d'Anjou, Paris.
 17,826 (1915). Inflatable life saving apparatus. T. Ingaramo, 31 Via XX Settembre, Genoa, Italy.
 103,715. Dies for marking shells supported by rubber rings. J. R. Hancock, 4 Fairview avenue, Cleethorpes, Grimsby, Lincolnshire.
 103,727. Pneumatic tire with sectional inner tubes. H. F. Norman, 5 Upper Ormond Quay, Dublin.
 103,755. Toys or game apparatus with vulcanite projectile. C. E. Evans, 37 Wynne Road, St. Helens, Lancashire.
 103,762. Rubber tooth brush cover. T. R. Plank, 220 North Rampart Boulevard, Los Angeles, California, U. S. A.
 103,811. Golf balls. St. Mungo Manufacturing Co., 121 Sylvan avenue, Newark, New Jersey U. S. A.

ISSUED APRIL 18, 1917.

- 7,932 (1915). Respiratory appliance. R. Donald, 39 Parliament Hill Mansions, Highgate Road, London.
 10,358 (1915). Wheel tire and rim attachment. F. A. James, 29 Capthorne Road, and P. A. James, Cotton Road—both in Wolverhampton.
 17,908 (1915). Compound fabric for containers. J. Peterson, 50 Union Square North, New York City, U. S. A.
 17,976 (1915). Clock case in which the glass is held against the rim by a toothed rubber annulus. A. Mond, 19 Southampton Buildings, Chancery Lane, London.
 18,101 (1915). Wire tread band for tires. L. R. Poschadel, 193 Garfield avenue, Milwaukee, Wisconsin, U. S. A.
 18,170 (1915). Spring wheel with rubber tread. C. A. Lim, Prospect Terrace, Rose Park, and F. F. Milford, Portrush Road, Toorak—both in South Australia.
 103,864. Soft rubber ear plugs. S. N. Pinkus, 42 Marszalkowska, Warsaw, Russia, and R. Lake, 62 Bickerhill Mansions, London.
 103,868. Wheel rim, particularly for motor vehicles. T. S. Sloper, Southgate, Devizes, Wiltshire.
 103,869. Rubber valve head. T. Sloper, Southgate, Devizes, Wiltshire.
 103,883. Polishing disk consisting of a solution of rubber mixed with emery powder. J. R. Cooper, 46 Hatfield Road, Birchfield, Birmingham.
 103,895. Rubber insets for billiard pocket plates. C. Kirton, "Curlew-road," Lee Bridge, and J. R. Cooper, 46 Hatfield Road, Birchfield, Birmingham.

- 103,901. Gas mask comprising sheet rubber and rubber attaching bands. R. L. Gravercaux and C. Martin, 17 Rue des Jeuneurs, Paris, France.

ISSUED APRIL 25, 1917.

- 103,966. Fountain pen cap. W. A. Wilkinson, 130 Court street, Blaenclwyd, Rhondda, Glamorganshire.
 104,076. Rubber-faced motorcycle driving belt. G. Warwick, 80 Cobham Road, Seven Kings, Essex, and A. P. Crouch, 106 Cannon street, London.
 104,110. Divers' glove and means of attachment. R. H. Davis, 187 Westminster Bridge Road, London.
 104,126. Douche apparatus. W. G. Brokaw, 41 Boulevard Haussmann, Paris, France.

ISSUED MAY 2, 1917.

- 104,175. Anti-skid device for wheel tires. A. J. Heinsius, Pittsburgh, Pennsylvania, U. S. A.
 104,192. Rubber roller and cushions for hat polishing machine. F. Webb, Lancet's Path, Alma street, and M. White, 22 Belmont Road—both in Luton, Bedfordshire.
 104,205. Vehicle wheel carrying a rubber tire. W. J. P. Moore, 629 West One Hundred and Fifteenth street, New York City, U. S. A.
 104,227. Rubber crutch tip and method of attachment. H. Crudgington, Blenheim House, Alcester Road, King's Heath, Birmingham.
 104,273. Rubber life-saving belt. F. P. Ingram, Fairlight, Chigwell Row, Essex.
 104,283. Leather tread band and chain for rubber tires. W. H. Gahan, General Delivery, Los Angeles, California, U. S. A.
 104,287. Divers' collar and attaching means. R. H. Davis, 187 Westminster Bridge Road, London.
 104,300. Rubber strip for aperture, closing plugs for ship, etc. G. Ferguson, care General Post Office, London, and J. R. Campbell, 175 West George street, Glasgow.
 104,309. Apparatus for detecting punctures in air tubes. T. Dunnery, the Workhouse, Cavan, Ireland.
 104,314. Rubber-tired vehicle. W. J. P. Moore, 629 West 115th street, New York City, U. S. A.
 104,323. India rubber. G. M. Thomas, and M. D. Maude, Cicely Estate, Teluk Anson, Perak, F. M. S.
 104,325. Stopper for hot-water bottles. F. C. Jones, 24 Belvedere Road, Upper Norwood, London.
 104,360. Suctions for the dentures of artificial teeth. H. M. Parsons, 46 Follywell street, Blackburn.
 104,373. Elastic wheel tire. S. Johnstone, Corunna, Ontario, Canada.
 104,401. Rubber covered flexible electric cables. British Insulated & Helsby Cables, Helsby, and E. A. Bayles, The Oaks, Helsby—both in Cheshire.
 104,452. Life-saving suit. O. A. Youngren, 730 North Main street, Sheridan, Wyoming, U. S. A.

 104,476. Fountain pen. A. E. White, 88 Chancery Lane, London.
 104,477. Dress shields. W. J. Taylor, Wimmera Lodge, Salisbury Road, Walthamstow, Essex.

THE DOMINION OF CANADA.

ISSUED JANUARY 31, 1917.

- 174,276. Cushion tire. E. B. Killen, London, E. C., England.
 174,291. Cushion tire. E. J. Mitchell, New York City, U. S. A.
 174,300. Wheel rim. D. H. Shapiro, Montreal, Quebec.
 174,323. Air hose couplings. L. C. Bonnelle and J. F. Lazano & Co., assignee of sixty-five one hundredths of the interest—both of San Antonio, Texas, U. S. A.
 174,330. Packing washers for caps or the like. A. Schrader's Son, Inc., New York City, assignee of H. P. Kraft, Ridgewood, New Jersey—both in U. S. A.
 174,334. Golf ball. The St. Mungo Manufacturing Co. of America, Newark, assignee of W. R. Knight, Belleville—both in New Jersey, U. S. A.
 174,335. Golf ball. The St. Mungo Manufacturing Co. of America, Newark, assignee of W. R. Knight, Belleville—both in New Jersey, U. S. A.
 174,347. Fountain pen. J. Familet and A. Brochetti, co-inventors—both of Dunkirk, New York, U. S. A.
 174,362. Rubber heel. E. J. Emery, Portsmouth, New Hampshire, U. S. A.
 174,367. Sectional cushion tire. J. T. Fitch, Helper, Utah, U. S. A.
 174,407. Fountain pen. J. L. Schnell, Arlington, New Jersey, U. S. A.
 174,411. Fountain pen. T. Tanamura, Rock Springs, Wyoming, U. S. A.
 174,438. Feed bar for fountain pens. The L. E. Waterman Co., Ltd., Montreal, Quebec, assignee of W. I. Ferris, Westfield, New Jersey, U. S. A.
 174,562. Tire armor. H. M. Hillman and J. Schwab—both of Winnipeg, Manitoba.
 174,624. Breast pump. J. F. McCleary, Findlay, Ohio, U. S. A.
 174,631. Pneumatic tire. J. B. Salmon, Dunedin, New Zealand.
 174,707. Tire valve stem. G. Hughes and D. F. Givens—both of Syracuse, New York, U. S. A.
 174,738. Cane handle comprising an air forcing bulb. S. E. Holdzkom, Longport, New Jersey, U. S. A.
 174,740. Combination spring and solid tire. I. James, Scranton, Pennsylvania, U. S. A.
 174,794. Closet seat comprising a solid core of hard rubber compound. The Brunswick-Balke-Collender Co. of Canada, Limited, Toronto, Ontario, assignee of M. J. Whelan, Muskegon, Michigan, U. S. A.
 174,795. Closet seat comprising a wooden core and a veneer of rubber. The Brunswick-Balke-Collender Co. of Canada, Limited, Toronto, Ontario, assignee of M. J. Whelan, Muskegon, Michigan, U. S. A.
 174,796. Closet seat having a wood core and a covering of hard rubber vulcanized thereto. The Brunswick-Balke-Collender Co. of Canada, Limited, Toronto, Ontario, assignee of M. J. Whelan, Muskegon, Michigan, U. S. A.

- 174,804. Shoe sole consisting of a rubber binder and wool fibers. The Canadian Consolidated Rubber Co., Limited, assignee of T. H. Rieder, and W. B. Wiegand—all of Montreal, Quebec.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 482,024 (June 14, 1916). Improvements in composition soles. T. C. Redfern.
 482,137 (June 26, 1916). Elastic wheel for all vehicles and airplanes. E. L. André.
 482,162 (June 29, 1916). Improvements in pipe-stems. Traun Rubber Co.
 482,183 (July 3, 1916). Improvements in tires for wheels and vehicles. W. F. Stewart.
 482,216 (June 10, 1916). Special pneumatic mattress. L. Malinge.
 482,253 (July 12, 1916). Joint for water and steam conduits. J. M. Bigot.
 482,259 (July 10, 1916). Solid rubber tire with fixed tread. N. N. Munoz.
 482,306 (July 21, 1916). Improvements in tire protectors. W. H. Gahan.

AUSTRALIA.

SPECIFICATIONS ACCEPTED (WITH DATES OF APPLICATION).

- 2,795 December 13, 1916). Pneumatic tire. J. C. Barker, England.
 2,998 (January 15, 1917). Resilient tire. A. A. Crozier, England.
 2,999 (January 15, 1917). Resilient tire. A. A. Crozier, England.

NEW ZEALAND.

- 38,384. Conveyer-belt having rubber layers. W. F. Bowers, 3196 Pacific avenue, San Francisco, California, U. S. A.

TRADE-MARKS.

THE UNITED STATES.

- 98,228. The word METRIC—machinery jacking made of rubber and other materials. Metric Packing Co., Buffalo, N. Y.
 9,387. The word VULPA—adhesive vulcanizing patches and adhesive vulcanizing fabrics. W. E. Spencer, New York City.
 100,317. Representation of a man's face on two styles of shoe soles, one showing him in tears, the other smiling—rubber and other boots, shoes, etc. C. Schevitz, Jacksonville, Fla.
 100,544. Representation of several tires across which appear the words Lox-It-Tite—tire repairing cement. G. K. Cogswell, Hutchinson, Kans.
 100,527. Representation of frog in rainstorm wearing a waterproof coat—waterproof coats, slickers, jackets, pants, hats, aprons and ponchos. H. M. Sawyer & Son, East Cambridge, Mass.
 101,116. The word CHASE—artificial leather with rubber surface coating. L. C. Chase & Co., Boston, Mass.
 101,261. The word NUGGETS—chewing gum. Common Sense Gum Co., New York City.
 92,087. The words RED SQUARE within a red square—rubber roofing. C. T. Overton, Towanda, Pa.
 94,848. The words GOLDEN KING—golf balls. The Worthington Ball Co., Elyria, Ohio.
 102,270. The word IDEAL—rubber brushes for bottle-washing machines. The S. S. Wenzell Machine Co., Philadelphia, Pa.
 102,913. The word STORK—rubber nipples, baby comforters or pacifiers, and babies' nursing-bottles. The Stork Co., Boston, Mass.

THE UNITED KINGDOM.

- 375,057. The word BEAVER—engine and machine packings, jointings and hose. The Beldam Packing & Rubber Co., Limited, 1 and 2 Gracechurch street, London, E. C.
 376,969. The word KRYLEX—all goods included in Class 40. Peerless Seamless Rubber Co., Limited, Richmond, Surrey.
 376,751. The word EXPRESS—rubber teats for feeding bottles. J. G. Franklin & Sons, Limited, 17 Colvestone Crescent, Dalston, London, E. 8.
 377,244. The word GEM—machines for treating crude and partly prepared india rubber. Summerscales, Limited, Phoenix Foundry, Royal Lane, Beechcliffe, and Coney Lane Works, Coney Lane—both in Keighley, Yorkshire.
 377,190. The word EXPRESS—hair combs. The North British Rubber Co., Limited, Castle Mills, Fountainbridge, Edinburgh, Scotland.
 376,476. Representation of a seal in an arctic scene, surrounded by a design bearing the words SEAL BRAND and a shield with the letters H S intertwined—elastic suspenders. H. Seal, 3 Red Cross street, Leicester.
 376,342. The word TUFFITE—substance in sheet form composed of india rubber and textile and other materials, the india rubber predominating. G. MacLellan & Co., Glasgow Rubber Works, 125 Shuna street, Maryhill, Glasgow.

- 50,673. Tire tread. Term 7 years. S. S. Adams, Lafayette, Tenn.
- 50,681. Tire tread. Term 14 years. J. S. Broughton, assignor to United & Globe Rubber Manufacturing Cos.—both of Trenton, N. J.
- 50,769. Tread for automobile tires. Term 14 years. E. Von Vargyas, Washington, D. C., assignor of sixty one-hundredths to J. J. Vavora, Binghamton, N. Y.

DESIGNS.

THE UNITED STATES.

- 50,652. Rubber ball. Term 14 years. R. C. Eddy, Milwaukee, Wis.
- 50,702. Reducing brassieres. M. Perillat, assignor to Ovilva Co., Inc.—both of New York City.

RUBBER REPLACING LEATHER IN BELTING.

THE present high cost of leather suitable for belting is proving most advantageous for manufacturers of rubber belting. A comparison of net cost per foot in Canada, given by J. M. S. Carroll, sales manager of the Canadian Consolidated Rubber Co., Limited, is quoted here:

	Net Cost Per Foot.	
	Leather.	Rubber.
12-inch Double	\$3.44	\$1.92
12-inch Single	1.72	1.45
8-inch Double	2.28	1.14
8-inch Single	1.14	.65
4-inch Double	1.14	.51
4-inch Single57	.34

Mr. Carroll predicts that leather prices will not drop to ante-bellum quotations for a long time and meanwhile a golden opportunity is presented for greatly increasing the sales of rubber belting.

WHY NOT NAME THE COMPANY?

“LE CAOUTCHOUC & LA GUTTA-PERCHA” claims that Germans have established in the United States a big factory for those rubber specialties so largely supplied by Germany before the war. It seems that these goods are sent to Paris, where agents, generally naturalized French or British subjects, but of Austrian and German birth, distribute them throughout France and the neutral countries, whence they usually find their way into Germany.

The journal declares that these proceedings should be stopped by prohibiting the importation of rubber manufactures, adding that the home industry is fully capable of supplying not only France but also the neighboring neutral countries.

After having encouraged Frenchmen to take up the new industry, it would be a piece of bitter irony on the part of the Government to allow Germans, acting as American or Swiss firms, to oust them through successful competition.

LA BELLE MINERAL RUBBER.

It will be recalled by some in the rubber trade that some years ago a gentleman in the Middle West named La Belle announced that by means of certain treatment he was able to compound and vulcanize mineral rubber (“Elaterite,” “Tabbyite,” “Gilsonite,” etc.) so that it showed a high degree of resilience, and this without the addition of any vegetable rubber. Mr. La Belle, who was an educated man of high standing, died without making arrangements with anyone to utilize his discovery. He, however, left all of his formulas in the hands of his widow who has lately made up some pounds of his compounds.

Of course, if “Elaterite” could be given resilience it would be of great value to the whole trade. That Mr. La Belle succeeded in adding this desirable quality, and that he did not add a particle of vegetable rubber, nor indeed have any in his laboratory, Mrs. La Belle is absolutely convinced. Mrs. La Belle has handed THE INDIA RUBBER WORLD samples compounded for vulcanization, and in the event that the results coincide with those attained by the inventor, the rubber trade will be duly notified.

THE WEBB BILL TO PROMOTE EXPORT TRADE.

A matter of but little less importance as a commercial preparedness measure than securing an immediate and adequate supply of raw materials, including rubber, at fair prices is that of solving the problems which will beset export trade from this country following the war. This can be accomplished by passage of the Webb bill at the present extraordinary session of Congress. As reintroduced in the House of Representatives and favorably reported from the judiciary committee, this bill would bring unfair methods of competition in export trade within the jurisdiction of the Federal Trade Commission with power to investigate the existence of agreements, understandings or conspiracies to enhance prices artificially or intentionally and unduly, and to make recommendations for readjustment to the firms involved or to the Attorney General of the United States for action should the undesirable practices continue. All export firms would be required to file an annual statement of organization, business, conduct, practices, management, and relation to other associations, corporations, partnerships and individuals.

THE LYONS FAIR, 1917.

The Lyons Fair, held from March 18 to April 1 under the patronage of the French Government and with the support of 40 chambers of commerce, was a great success. This year 2,526 exhibitors were accommodated in 2,320 stands, as compared with 1,342 exhibitors in 912 stands at the fair of 1916. The nations represented in their numerical order were France, Switzerland, Italy, England, America, Portugal, Spain, Holland, Russia, Belgium, Japan, China and Sweden. There was a total of 99 exhibitors of automobiles, cycles, carriages and tires, 36 exhibitors of engineering sundries, belting, solder, gearing, fire extinguishing apparatus and the like, and 48 exhibitors of footwear. Whereas only two American firms were represented in 1916, 25 exhibited this year, and in the stand rented by the United States Consulate numerous catalogs of American manufacturers were on view with satisfactory results.

AMERICAN RUBBER GOODS IN AUSTRALIA.

Imports of American rubber goods in Australia show a great increase. For 1915-16 the total imports of rubber articles amounted to £940,000, of which more than half—£480,000—came from the United States.

Rubber exports from the Congo Free State amounted to 2,311,300 pounds in the first six months of 1916.

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK.

THE feature of the market for the past month has been the demand for spot and nearby rubber of all grades and sorts. The volume of business transacted has been large in some quarters, while in others very little has been doing. Sellers who were able to make prompt deliveries have had no trouble in disposing of their holdings. Inquiries for futures have been noticeably frequent but actual buying was negligible, due to the tendency on the part of consumers to await lower prices. The shipping situation is becoming more complicated, and freight rates have again advanced. Ocean charges are increasing to such an extent that 15 cents a pound for Far Eastern shipments is not at all improbable.

Plantation prices have been generally steady with slight changes during the month, the tendency being upward. On May 1 First latex and Smoked sheet ribbed spot were 81½ cents; July-December for both grades was quoted 77 cents. The prospect of a war tax stimulated the market somewhat and on May 15 First latex and Smoked sheet ribbed spot were 85 cents and July-December for both grades was 79½ cents. During the last two weeks the market eased off as the buying interest relaxed and on May 26 First latex and Smoked sheet ribbed spot were 83 cents and July-December for these grades was 78 cents.

Spot Paras have been in demand, Upriver fine selling at 76 cents on May 26, a gain of 2 cents during the month. Upriver coarse has been especially strong, the price of 54 cents on May 26 being considered unusually high. This grade has advanced about 2½ cents during the month. Centrals have been going well at higher prices and spot stocks are very small. Centrals are now higher in price than Caucho ball. The call for Africans, particularly spot and near by, has been no exception to the demand for all grades of nearby rubber.

During the fiscal year ending June 30, 1916, 56,000 tons of plantation rubber were imported into the United States from the Far East, the average being 4,676 tons a month and we have consumed every pound. Now the eastern shipping situation threatens to curtail this important source of supply, and, moreover, Singapore shippers are beset with new difficulties in securing permits, while the exchange question continues to grow more serious. That the able committees of The Rubber Association of America, now working energetically to insure a constant supply of crude rubber will be successful is confidently expected.

LONDON.

Early in the month trading was brisk on all grades and forward sales were freely reported. Standard crêpe spot was going well at 37d. on May 1 and Smoked sheet spot sold at 36¾d. Forward sales of the standard grades were made at 36¾d. The market continued fairly active with particular attention centered on May-June arrivals that were quoted at relatively higher prices than spot rubber. Prices remained fairly steady during the balance of the month that was characterized by quiet conditions almost approaching dullness. The spot quotations on May 26 were: Standard crêpe, 36½d., and Smoked sheet ribbed, 36¾d.

The report that British ships have been taken off the Far Eastern run, leaving rubber cargoes to Japanese and Norwegian carriers, has caused considerable comment.

London imports for March were 6,562 tons, compared to 4,748 for February. Reexports were 2,827 tons, compared to 5,043 tons for February. Liverpool imports for March were 2,218 tons, compared to 2,410 tons for February. Reexports were 1,232 tons, compared to 1,331 tons for February.

SINGAPORE.

The inability to secure adequate cargo space threatens this source of America's greatest rubber supply. Shipping permits are curtailed or canceled for preferred cargo allotments. The difficulties in negotiating drafts are becoming more apparent and this constitutes a serious menace to this market. Exporters are looking hopefully for relief of some sort from American consumers.

The Singapore cables indicate a dull market with small demand. At the auctions held April 28, May 5, 11, 18 and 25, the following average prices were obtained: First latex crêpe and Smoked sheet ribbed 65.36 cents, compared to 68.9 cents last month. The total quantity sold was 2,618 tons compared to 2,105 tons last month.

COMPARATIVE NEW YORK PRICES FOR MAY.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"As reported at the end of April, a considerable change came over the general money market, and the demand for paper fell off materially with an advance in rates, and these conditions have continued through May, the general demand for paper being light, with 5 to 5 1/2 per cent quoted for the best rubber names and 6 per cent for those not so well known."

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [April 5, 1917]:

At the weekly rubber auction which commenced yesterday, there was a good demand for all grades, at about last week's prices for first latex rubber and slightly improved prices for lower grades. At the continuation of the sale today, prices for the leading grades advanced by \$4 per picul in the case of ribbed smoked sheet and \$1 in the case of fine pale crêpe, and the prices of lower grades also shared an improvement. The top price of the sale for ribbed smoked sheet was \$164 per picul, paid for one lot only, this being \$3 above last week's best. Fine pale crêpe fetched up to \$162, an advance of \$2. Unsmoked sheet received more attention than usual, and brown and good dark crêpes were a strong market. Of 762 tons catalogued, 567 tons were sold.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked	\$155 @ 164	3/ 0 1/2 @ 3 1/2	65.87 @ 69.70
Sheet, good ribbed smoked	140 @ 158	2 3/4 @ 3 1/4	56.50 @ 67.15
Sheet, plain smoked	125 @ 139	2 6/16 @ 2 9/16	53.12 @ 59.07
Sheet, ribbed unsmoked	130 @ 144	2 7/16 @ 2 10/16	55.25 @ 61.20
Sheet, plain unsmoked	108 @ 134	2 2/16 @ 2 8/16	45.00 @ 56.95
Crêpe, fine pale	158 @ 162	3/ 4 1/8 @ 3 1/2	67.15 @ 68.85
Crêpe, good pale	153 @ 160	3 1/16 @ 3 1/8	65.00 @ 68.00
Crêpe, fine brown	136 @ 152	2/ 8 1/2 @ 2 11/16	57.80 @ 64.60

STRAITS SETTLEMENTS RUBBER EXPORTS.

The export of plantation rubber from Straits Settlements ports in the month of March, as reported officially by cablegram from Singapore, amounted to 8,299 tons, the highest figure yet recorded for one month's shipments. This compares with 6,495 tons in February last and 4,481 tons in March, 1916, and brings the first quarter's shipments up to 18,356 tons compared with 12,283 tons for the corresponding period last year. Of the March total, 954 tons were transshipments from adjacent countries. Appended are the comparative statistics for three years:

	1915.	1916.	1917.
January	2,576	4,443	3,562
February	2,741	3,359	6,495
March	2,477	4,481	8,299
Totals	7,794	12,283	18,356

The above figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the Malay States other than the Federated Malay States.

India	550	
Japan	45,396	22,368

Totals 15,431,400 16,741,567
(Same period 1915, 11,099,434 pounds; same period 1914, 8,790,185.)
The export figures of rubber, given in the above table for 1914, include the imports reexported. (These amount to 752,936 pounds from the Straits Settlements and 248,110 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1916 and 1917 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

The export of rubber from the Federated Malay States in the month of April, as reported by official cablegram from Kuala Lumpur, amounted to 5,955 tons, as against 7,084 tons in March and 3,914 tons in the corresponding month last year. For four months, the total export was 26,284 tons, compared with 18,021 tons in 1916 and 13,079 tons in 1915. Comparative statistics are appended:

	1915.	1916.	1917.
January	3,473	4,471	5,995
February	3,411	5,207	7,250

THE MARKET FOR RUBBER SCRAP.

Copyright 1917.

NEW YORK.

THE conditions surrounding the rubber scrap market have not materially changed during the past month. A feeling of optimism, however, has prevailed, resulting in a firm undertone that indicates higher prices. This sentiment is reflected from general conditions that bespeak higher values for all commodities, crude rubber being in a particularly strong position. While the mills have undoubtedly been in the market, the buying has been confined to limited quantities for immediate requirements. The uncertainties now besetting the materials used in the rubber industry have restricted buying and encouraged the policy of awaiting future market developments.

BOOTS AND SHOES. This material has received fair attention and while the actual business transacted has not been large, the market tone has been firm and prices have advanced about $\frac{1}{4}$ cent per pound since our last report. This is doubtless due to orders from the Government and the Allies for rubber footwear that is now considered necessary in every soldier's equipment.

TIRES. The call for tires has been limited to small lots, the business done being of a routine character, with the greater interest centered in standard mixed grades. Prices have been firm, ranging from 7 to $7\frac{1}{4}$ cents delivered. White G. & G. tires have been featureless, sales being recorded at $7\frac{1}{2}$ cents delivered. Bicycle tires have experienced a fair demand at firm prices unchanged from last month's quotations.

The scarcity of standard cotton fabrics has driven tire manufacturers to use Peeler fabrics with the result that the quantity of unguaranteed tires now being manufactured will be greatly increased in the future.

INNER TUBES. There has been limited call for this material and prices are unchanged, $25\frac{1}{2}$ cents delivered being the quotations on No. 1 tubes. Just what effect the greatly increased use of unguaranteed tires will have on tubes remains to be seen. That the supplies of tubes will be augmented thereby is unquestioned.

MECHANICALS. The general industrial activity has increased the call for mechanical rubber goods and the mills are very busy. The movement in mechanical scrap has been good during the month, garden hose, air brake hose and cotton hose being in particular demand and at about $\frac{1}{4}$ cent advance over last month's prices.

London and Liverpool imports of waste and reclaimed rubber for March were 114,600 pounds, compared to 38,000 pounds for February. Reexports for March were 55,900 pounds, compared to 63,600 pounds for February. London and Liverpool exports of waste and reclaimed rubber manufactures of the United Kingdom for March were 815,300 pounds.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917.

NEW YORK.

AMERICAN COTTON. Early in the month the market was decidedly unsettled and nervous, owing to the reports of reduced acreage and the uncertainty of domestic demand for cotton manufactures. On May 1, spot middlings were selling at 20.70 cents but lacked support and the market declined with minor fluctuations until May 11, when 20 cents, the lowest price of the month, was recorded. Influenced by more reassuring reports, the market sentiment changed and prices took an upward trend that persisted until May 26 when spot middlings were quoted at 21.95 cents in one of the most active days the market has experienced in months, due to the belief that the coming Government report will forecast a short crop.

EGYPTIAN COTTON. The general market condition has not improved during the month and stocks are very low and prices are high, ranging from 60 to 66 cents. The shipping situation has been relieved in a measure by the shipment of 15,000 bales direct to America and which is still afloat. From recent reports it appears that the prospects for the new crop are good and that the acreage is somewhat larger than last.

SEA ISLAND COTTON. The crop of Islands has all been sold and the new crop will not be marketed before October. The market for Georgias and Floridas has been quiet with limited offerings. The unsold portion of the crop is estimated at 2,000 bales that are firmly held at prices varying from 71 to 72 cents, according to quality.

It is reported that the planters of the British West Indies, influenced by the present attractive prices, have resumed the planting of Sea Island cotton, 2,000 acres being recently planted in Nevis. The planters of Montserrat, Anguilla, Antigua, St. Croix, Barbados, St. Kitts, and St. Vincent will doubtless increase their acreage of Sea Island cotton to meet the present extraordinary demand.

TIRE FABRICS. The demand for all grades has been quiet for the past month with the interest centered on prompt deliveries. Buyers have not been particularly interested in futures, preferring to await developments. The scarcity and high prices of Sea Island and Egyptian tire fabrics have resulted in unprecedented offering of Peeler fabric. While the blending of long staple Peeler with the standard yarns has been practiced and $17\frac{1}{4}$ -ounce combed Peeler fabric tried out, the results of these experiments are still indefinite. There is no doubt that staple cotton under $1\frac{1}{8}$ -inch will be more extensively used in fabrics for unguaranteed tires to meet the increasing demand. Prices on standard Sea Island and Egyptian building fabric have not changed; $17\frac{1}{4}$ -ounce combed Peeler fabric has advanced 10 cents a square yard and carded Peelers are 5 cents higher than a month ago.

MECHANICAL DUCK. The general industrial activity and the speeding up of factories, mills and mines is requiring large quantities of mechanical rubber goods and the demand for mechanical, hose and belting duck has been very active. This is primarily due to Government orders that will require, it is estimated, 50 per cent of the duck produced in this country. Hose and belting duck have advanced about 1 cent a pound during the month.

SHEETINGS, OSNABURGS, ENAMELING DUCK. The demand has been unprecedented, spot stocks have been completely cleaned up and seconds and odd lots are promptly taken when offered. Government orders are so heavy for these fabrics that the supply may not be equal to the demand. Prices have all advanced about 1 cent a yard. Drills are very active and scarce, but prices have not yet advanced.

The mills are now complaining of scarcity of labor, high price of coal, shipping difficulties and a general increase in operating expenses that would indicate still higher producing costs and further price advances to the consumer.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright 1917.

NEW YORK.

ALL the base metals have maintained a very strong position during the month, lead being the feature, having advanced in price due to the certainty of large Government requirements and the knowledge that stocks are small. The firm tone in spelter, despite inactivity, is based on the high price of ore and the anticipation of heavy Government buying in the near future. Copper has been firm and prices nominal. Consumers are interested but appear to be waiting market developments before buying. Antimony metal has been generally dull and prices unchanged. Aluminum has not been in demand, with prices ruling at 59@61 cents for No. 1 metal. The spot demand for rubber chemicals has been brisk and available stocks of many materials have been well cleaned up. Beyond making frequent inquiries, consumers do not appear to be interested in future commitments, preferring to await market developments. The tone of the market has been strong, with a general upward tendency, many materials having advanced in price since last month.

ALUMINUM FLAKE. This material is strong and in active demand. Prices have advanced about \$1 a ton during the past month.

ANILINE OIL. This is very strong, due to scarcity of base materials. Prices have advanced.

ASBESTINE. Stocks are said to be low and prices have advanced.

BARYTES. The trading in the imported grades has been quiet and prices unchanged, while the demand for domestic barytes has been good at firm prices.

CARBON BISULPHIDE. The demand has been good and prices have been firm, with advancing tendencies due to low stocks.

CHINA CLAY. Shipping difficulties have held up supplies and stocks are insufficient to meet the demand. Both foreign and domestic grades have advanced in price.

DRY COLORS. The market has been generally firm in price with certain colors totally lacking in demand. There was a noticeable scarcity of some imported grades and certain domestic stocks were unobtainable. Carbon gas black has been firm and producers well sold up on contracts. Prussian blues have held a strong position, while browns are in moderate demand. The greens are firm, and the market for reds is fairly easy. Chrome yellow is firmer, due to the strong position of lead.

LITHOPONE. There has been a good demand for this material and prices have been well maintained, due to the strong position of the base metals.

LEAD PIGMENTS. White lead, basic carbonate and basic sulphate, red lead, litharge and orange mineral have all advanced during the month, due to the strong position of pig lead.

OILS. The oil market has developed a very firm tone recently on account of shipping difficulties and scarcity of labor. Linseed, corn and rapeseed oil have all advanced. This will affect the price of rubber substitutes.

SULPHUR FLOUR. The demand has been heavy and while prices have not changed, the tendency is upward.

WAXES. These are generally higher in price, caused by the uncertainty in the shipping situation, both foreign and domestic.

ZINC OXIDE. The demand for spot zinc oxide has been very active and the limited offerings available have been quickly absorbed. Speculative prices have advanced $2\frac{1}{2}$ @ 3 cents during the month. The producers are busy supplying contract deliveries and are apparently not interested in the spot market. The fear that there is not sufficient stock to meet the demand is causing some concern in the consuming trade.

TABLE OF CONTENTS ON LAST PAGE OF READING.

SOME WAR DON'TS.

DON'T fail to join and support the Red Cross. Whether Pro-Ally or Pro-Turk, Protestant, Catholic or Pagan, Democrat, Republican or Free Soiler, Patriot, Traitor or Common Coward, you can do this at least with a clear conscience.

Don't think your Liberty Bond lets you out. It lets you in for greater effort.

Don't waste anything—food, clothing, time, effort, money, words.

Don't let your neighbor's stinginess bother you—cure your own.

Don't be peeved if the other fellow gets all the glory—you know what you did.

Don't fail to thank God daily that you can walk unafraid—that a wall of Allied steel makes this possible. Thank offerings are the best of Thank-Gods.

IT IS THE LONG RUN THAT TELLS.

THE United States has rallied with characteristic fervor to the defense of freedom and democracy. Patriotism prevails; preparedness is going forward speedily; the Liberty Loan is a success, and men, women and children in every walk of life are doing something for the country they love. Such a generous response has been easy of accomplishment because as yet it has entailed no great sacrifices. But it must not be forgotten that there will be other drafts, other bond issues, still higher cost of living and perhaps more drastic taxes, for the conviction grows that the war will not be a short one. Training, munitioning, preparedness generally, is a joyous business as compared with actual armed conflict, and with the waning of the first enthusiasm and the inevitable toll of American youth our ardor must not be permitted to languish nor our determination to falter.

This is the greatest undertaking the American people have ever engaged upon and as time passes the part we are destined to play in forcing a triumphant decision ever looms larger. It is not hasty, demonstrative action to-day that will win the war, but constant, consistent, concerted effort of the whole people. Every industry, every class must do its share and persist until the end. The rubber industry has begun nobly and we believe will so continue; indeed, it is already accomplishing much of which the public, even the trade in general, knows nothing. THE INDIA RUBBER WORLD, therefore, desires to publish a permanent monthly record of what the rubber firms of the country are doing to meet this great national crisis and of every patriotic act of employers and employes alike that will tend to maintain enthusiasm for the national defense.

Practical patriotism in one factory, store or office stimulates like acts elsewhere and by the dissemination of such news we can perform a measure of service. Our readers are therefore urged to send to us for publication particulars and personnel of all patriotic movements and also individual participation in the war in order that this record of honor for the rubber industry may be complete.

THE STIMULUS OF WAR.

THOSE who fear that the war may bring disaster to the American rubber industry will do well to study the present situation in England as forecasting what may reasonably be expected here. For example, the annual report of J. Mandleberg & Co., Limited, waterproofers, Manchester, England, published early in May, shows that the business was never more prosperous. According to a tabular record of this company for the past 19 years the net profits for 1914, 1915 and 1916 were respectively £49,200, £71,000, £86,700; ordinary dividends, 15, 20, 20 per cent; depreciation allowance, £2,800, £3,500, £3,500; reserve allowance, nil, nil, £10,000; carried forward, £31,000, £49,100, £72,900. Thus the 1916 profit increase over 1915, itself a remarkable year in the

company's history, was £15,700. For the third time within seven years a share bonus of £60,000 has accordingly been capitalized and distributed to the ordinary shareholders, one new share for every four formerly held. Sixty per cent of the existing ordinary capital now consists of bonus shares.

It is logical to suppose that the American rubber industry, which plays such an important part in munitioning our armies, will feel the same stimulus of war. Labor troubles may cause some hardship at first, although as in England certain lines of rubber manufacture will probably figure among the exempted occupations, but eventually, as in all the belligerent countries of Europe, women will come to the rescue in a much wider field of employment than hitherto.

AMERICAN GROWN PARA RUBBER.

THERE has in the past been a decided doubt in minds of many regarding the possibility of cultivating *Hevea* successfully in any American possession, even in the Philippines. This doubt has often taken the form of vigorous statement, but more frequently of a quiet but effective lack of interest on the part of rubber men, scientists and planters. There were those, however, that believed in such planting and were ready to put in time and money to prove themselves right. And they have succeeded. On one of the Southern islands, Basilian, close to the great tropical land of Mindanao, is a plantation of Para rubber that tree for tree is the equal of any. There are 70,000 trees just beginning to bear and this year they have already produced more than 50,000 pounds of crêpe of the best quality, which sold for the highest price in the market. The cost per pound is incidentally said to be a trifle less than is the cost of production in the Malay States.

If 70,000 trees, why not 700,000 or 70,000,000?

THE STABILITY OF THE TIRE BUSINESS.

CAPTAINS of the American rubber industry believe that the experience of Canada should dispel any doubts concerning the stability of the motor car and tire business of the United States as affected by the war. Canada has gone through the same conditions that now confront us, and after two and one-half years of warfare general business is very good, notwithstanding the constant crusade for economy and the great drain of money and men, the latter equivalent to a United States force of 7,500,000. According to a canvass just completed by G. M. Stadelman, vice-president of The Goodyear Tire & Rubber Co., Canada, with a population of only 8,000,000, is buying 100,000 new cars, almost five times as many as were purchased during 1914, and an increase of 85 per cent over the normal growth of 38 and 36 per cent respectively for 1913 and 1914. Her purchase with only about one-fifteenth the population of the United States is equivalent to our purchase of 1,500,000 auto-

mobiles, which is just about what motor car manufacturers estimate that this country will buy during 1917. This means 6,000,000 tires for this equipment alone.

THE RUBBER CLUB OUTING ABANDONED.

SINCE its inception in 1900 the Rubber Club, now The Rubber Association of America, has enjoyed an unbroken series of midsummer outings. This year, however, with commendable regard for the seriousness of the times and the amount of human suffering every dollar will alleviate, it has decided to forego this annual event and contribute the money usually subscribed for that purpose to the Red Cross or some equally worthy cause. This is in line with the abandonment of the mid-winter banquet of 1915, when the amount that would otherwise have been spent in feasting was sent to starving Belgians.

GOODYEAR, CONNECTICUT.

IT IS PECULIARLY FITTING THAT CONNECTICUT SHOULD have a town named Goodyear, for it was in that state that Charles Goodyear was born and lived most of his ambitious life in poverty. His process of vulcanization ranks among the greatest discoveries of all ages, yet like many another inventor, he profited little by it, although it has accumulated fortunes for later generations and proved a boon to mankind generally. Government designation of the post office, formerly Killingly, as Goodyear, constitutes an official recognition of genius and an enduring memorial to persistence crowned by ultimate success. It will serve in a measure to keep his memory fresh in the minds of all whose livelihood depends upon his early researches.

BICYCLE RIDING IS ON THE INCREASE.

TRADE papers state that 600,000 bicycles were manufactured in 1916 against half that number the preceding year. More would have been made but for the shortage of tubing and labor. Manufacturers expect to produce 1,000,000 bicycles this year, a gross business of \$25,000,000, of which \$5,000,000 represents 2,000,000 tires.

THAT THE AMERICAN RUBBER TRADE IS THOROUGHLY abreast of the times is shown by the fact that four of the foremost rubber companies, the United States Rubber Co., the Goodrich, Goodyear and Hodgman companies, are fully equipped, mechanically and technically, to produce coated fabrics for war balloons, of which our Government will require very many.

CANADIAN IMPORTS of rubber, gutta percha, etc., for the fiscal year ending March 31, 1917, were \$5,767,508 from the United States and \$3,636,066 from Great Britain. During the year, automobiles to the value of nearly \$9,000,000 were imported from the United States.

What I Saw in the Philippines—I.

By the Editor of The India Rubber World.

Primary Reasons for the Trip.—The Influence of Smith.—Mine Own and Others' Ignorance.—Honolulu in Passing.—The Venezuela.—History of the Philippines.—A Day in Yokohama.—Smoking Room Wisdom.—Side Lights on the Filipinos.

IN the month of December, 1916, a man threatened to cut my throat and I fled to the Pacific Coast and there embarked on the Pacific Mail steamship "Venezuela" for the Philippines. I should perhaps explain that he was neither insane nor blood-thirsty, but simply a surgeon who collected tonsils. Mine were a bit bothersome, but as they were the only set I had I did not feel like sparing them, particularly as he had plenty of others in glass jars accumulated during years of predatory physicianing. So I fled and before I got to Manila my throat was in such good shape that I had to hire a Chinese steward to cough just to make me feel that I was back enjoying a New England winter.

Of course, "it wasn't the cough that carried me off" entirely.

I really had a very definite object, indeed a series of objects. For a long time I had been gathering in the opinions of long distance experts upon conditions in the Philippines, and it was slowly dawning upon me that it was possible that they did not wholly know what they were talking about. The statements that no white man could live there, that no labor was available, that Para rubber could not be successfully cultivated, and so on, struck me as not being backed up by facts. Besides there was Smith. He always has definite ideas, and is always wrong. For example, he predicted in 1904 that plantation rubber would never reach 1,000 tons a year; that it would never really pay any rubber company to employ a chemist; that the double tube tire would never be adopted by American motorists; and in 1911 that rubber would never again go above 60 cents a pound. As a final test I had therefore gone to him with:

"I wonder if it would be possible to cultivate Para rubber in any part of our Philippine possessions!"

"Not a chance. I looked into that thor——"

I knew then that it was well worth my while to see the land that would one day produce most of our plantation rubber.

There was also my belief that the psychological time had arrived for such a trip. My visit to Ceylon and Singapore in 1904 bore some fruit in the United States, much more in Europe. With the greatly increased knowledge of American rubber men concerning foreign parts, would not an impartial view of possible rubber planting sections be at least readable and possibly profitable?

Pondering my fellow countrymen and their knowledge of the Island Empire of the Pacific, they group themselves about as follows:

Those who do not know whether the Philippines is one of Paul's epistles, or the plural of philopena, and—

Real observers, scientific and commercial, whose conclusions are in the main sound and anyhow are always worthy of careful attention.

Of course, between these extremes is to be found a host that possess a weird and appalling variety of misconceptions concerning the islands and the people.

Speaking of the ignorance of others I must fain confess that

my own was considerable. It is difficult for me to get an idea of size from a map. As an extreme example I know that Australia is vast. Its measurements tell one so, but until I visit it and experience the magnificent distances it will always remain subconsciously a small square daub down in a lower corner of the map. So it was with the Philippines. Until I visited them they were big islands accord-

HONOLULU FROM THE GOLF CLUB.

ing to description, but my imagination relegated them to the little things like the lesser Antilles or the Azores. Further than this there was always the mental effort in locating Manila, as to whether it was on Panay or Luzon; whether it was Mindoro or Mindapao that was the big southern land, and if Cebu were a hump-backed ox and Zebu an island.

It is, of course, exceedingly difficult to get accurate information concerning matters at a distance on any subject, but concerning rubber it is almost hopeless. From what I knew of the southern of the Philippine Islands I was convinced that there were great plantation possibilities, but it was difficult to prove. I had paid a goodly fee to a young man who was voyaging thither to gain for me accurate information regarding conditions, but his report, long delayed, was of no value. He began by believing what someone in Manila told him, that rubber could not be grown, and nothing else mattered. During his journey through the Southern islands he found nothing, because that was what he expected to find. He acknowledged that soil, climate, rainfall, everything pointed to a paradise for *Hevea* but "it wouldn't grow!" As to the "why" he had no adequate answer.

To my surprise I found that many business and scientific men

returning from the Philippines were of the same opinion. But they would not say why, at least, if they did give a reason it did not appear to be sound.

We passed at Honolulu a few hours only, just long enough for one of our long-time friends, Fred Waterhouse, to take us about the city in a motor, visit the Golf Club, and meet at luncheon numbers of delightful people. He and his family have large rubber plantations in the Federated Malay States, so there was much to talk about.

Just a word about our boat: Eastern transportation experts had scoffed at the idea of comfort on any Pacific boats other than the big English or Japanese liners. They evidently did not know the "Venezuela," of the Pacific Mail, and owned by Americans. She was a new, sturdy, perfectly equipped passenger boat, a bit slow, thirteen knots being her best. An oil burner, she was unusually clean, and with the American and Scandinavian officers, her tidy Chinese stewards, Filipino band, and passengers bound for all parts of the Orient, the setting was full of variety and interest. English boats as a rule are noted for the spirit of camaraderie that exists and that shows in the deck sports in which all take part, while American boats have in the past been singularly lacking in this. The "Venezuela," however, was an exception. Deck golf, shuffleboard, and dozens of sea sports were in full blast all day long, and old and young participated with the greatest enthusiasm. I wanted to be absolutely fit when I got ashore, so I fairly lived on deck.

If, as the Romans believed, the seat of the intellect is in the stomach, a three-week's voyage on the heaving Pacific is at least conducive to an open mind. I felt after the first week that I was approaching my subject absolutely empty of prejudice.

As a preliminary to my investigation I posted up on the history of the islands. It is this as far as we are concerned:

Discovered by Magellan in 1521.

Recovered by Dewey in 1899.

Covered by the Republican Party in 1900.

Uncovered by the Democratic Party in 1912.

That there was a great war in progress we hardly realized. That unusual precautions were being taken, the care with which passports were issued proved. Then, too, when we visited Japanese ports our few German passengers went ashore only in the

care of dapper Japanese detectives. Our wireless news was scrappy and unsatisfactory. The majority of the passengers believed in the final and deserved triumph of the Allies, and those who did not kept it to themselves as far as they could.

At Yokohama another old friend, Kenzo Okada, who some 20 years ago worked in the Apsley factory in Hudson and the Home factory in Trenton, and who is now at the head of a large rubber mill of his own, gave us a luncheon *à la* Japanese. It was delightful. Okada had also been interested in a rubber planting scheme in Formosa which he reported had not been a success, the island lying too far north to grow *Hevea* successfully.

Did I say our boat was a rubber carrier loading big cargoes at Hongkong and discharging at San Francisco? Also that the smoking room crowd contained men that knew much of plantation companies and affairs in Singapore, and the Malay States? To talk with some of them was almost as good as a visit to the great plantation countries.

As a rule the talk was the shipping situation, and that there was not in sight a fleet of cargo carriers big enough to take care of the rubber accumulating on the plantations and in the rubber ports. Said one of them:

"New York is bound to be out of it for a while at least. German submarines in the Mediterranean and the Atlantic are getting too many ships. The result is that all of the nations whose boats have been sunk are steadily withdrawing freighters from the Pacific and using them at home. Japan is of course increasing her fleet, but she will be called upon to send cargo carriers to the danger zones ere long. Even then the United States cannot depend upon London for rubber,

but must look to Singapore. Not only is this so, but it must be boats that come to United States ports, for the Canadian railroads are bound to be congested and unable to handle our rubber. The godowns in the rubber ports are carrying more rubber than ever before. Then there is the question of permits which is hard to arrange so that they coincide with available cargo space. And beyond all this is the difficulty in financing purchases. What we need is an American line of direct boats, perhaps touching at Manila, and we need them in a hurry."

Curiously enough it was ships, ships and more ships that all were talking, and, getting ahead of my story, from December to April in the Pacific, in the Sulu sea, in Manila and in San

THE SHUFFLEBOARD FINALS.

THE STEAMSHIP "VENEZUELA."

Francisco it was the same. Indeed the last words on the subject spoken in Honolulu and later in San Francisco were by the secretary of the Mansfield Rubber Co., who was just returning from a visit to the rubber plantations in the Far East. His plan was for the rubber and automobile companies to combine in owning their own cargo carriers. They were to be wooden ships of about 3,000 tons each, to carry any freight that seemed profitable but to give preference to automobiles going out and rubber com-

THE FAMOUS COLEMAN CARTOON.

ing back. They were to be oil burning, costing some \$400,000 each. The plan was to incorporate "The Rubber & Automobile Freight Line," capitalized at \$9,000,000. Of this \$4,000,000 to be 6 per cent preferred stock, to be sold at par and to carry one share of common as a bonus, leaving \$1,000,000 in the treasury for promotion purposes. A point was that each automobile or rubber stockholder was to have a preference as to cargo space proportioned to his stock holdings.

Side lights on the Filipinos also were constantly being thrown by what the passengers returning to the islands said. For instance:

"The Filipinos would be the worst scared bunch in the world if Uncle Sam really let go," said one who knew. "They are as independent to-day as are the natives of Massachusetts and they know it. The leaders don't want it, and the mass of the people would not have it. Only a few restless sore-heads wish it, so that they could get a chance to graft and loot. Did you ever see Coleman's cartoon of the war scare? That was what epitomized the end of the independence movement. They woke up then, and in a few years they will all be ardent Americans, indeed the mass of them are to-day."

(To be continued)

TRADE JOURNAL PUBLISHERS HELP ENLISTMENTS.

The New York Business Publishers Association, which includes in its membership the leading trade journals published in New York City has been maintaining 45 recruiting stations securing enlistments at the rate of 300 daily. Governor Whitman at a meeting at the Yale Club, June 15, personally thanked the members for their patriotism and activity.

The trade press of New York City now has three members in the War Economy Committee: Charles G. Phillips, of the *Dry Goods Economist*; Louis Hahn, of *Women's Wear*, and Roger W. Allen, of the *American Hatter*. These will report to the Commerce Economy Board of the Council of National Defense.

ALL EXPORTS UNDER GOVERNMENT CONTROL.

THE Espionage Law with its embargo clause giving the President power to control all exports, including crude and manufactured rubber, effects the complete incorporation of the United States into the allied economic strength and gives the alliance practical trade domination of the world. This law prevents supplies from reaching the enemy through neutral countries, conserves all American resources for American and allied use, and befriends neutrals agreeable to the alliance. It also removes the necessity of the British blockade, as the United States, with the aid of British machinery established during the past three years, is in a position to see that neutrals contiguous to Germany are supplied with just enough food and materials for their own needs. The exercise of this new power over exports will in turn force the release of much needed raw materials controlled by the Allies which heretofore have been permitted to come to America only in limited quantities.

Fair control over shipping will result. As administered, the act will require licenses for export cargoes and under this arrangement the government can force neutral ships from harbors where they have sought safety from submarine attack into service to transport cargoes wanted by their home countries. American and Allies' shipping, too, can be requested to carry cargoes to the destinations the government considers should be supplied for a proper conduct of the war.

INSULATED WIRE AND CABLE MANUFACTURERS FACILITATE GOVERNMENT ORDERS.

RECENTLY when the Navy Department urgently required 1,000,000 feet of No. 14 Duplex lead cable in 30 days' time, the usual procedure of securing bids according to established specifications was set aside, and the order was delivered promptly. Representatives of the principal wire concerns were called to Washington for a consultation, resulting in a unique plan that fully provided for the exigencies of the occasion. A Wire and Cable Committee of the Advisory Commission of the National Council for Defense was appointed, consisting of Le Roy Clark, Safety Insulated Wire & Cable Co., New York City, chairman; Wallace S. Clark, General Electric Co., Schenectady, New York; Edward Sawyer, Atlantic Insulated Wire & Cable Co., New York City. Schedules of Government requirements are submitted and the committee nominates the manufacturer and suggests the price for the goods. Thus the usual red tape is for the time being eliminated and insulated wire and cable supplies are being delivered to the Government without delay.

GOVERNMENT FOOTWEAR PROPOSALS.

The Bureau of Supplies and Accounts, of the Navy Department, has received proposals for the supply of gymnasium shoes and rubber boots as follows: 273,400 pairs of gymnasium shoes, in accordance with specifications, John Wanamaker, New York City, \$0.97 per pair, and United States Rubber Co., New York City, \$1.03 per pair. Additional bids of \$0.93 and \$0.80 per pair, as per samples, were received; 81,296 pairs of rubber boots, in accordance with specifications, Hood Rubber Co., Watertown, Massachusetts, sample No. 1, \$178,451.52, sample No. 2, \$165,651.20, United States Rubber Co., New York City, \$183,722.24 for amount as specified and additional bids in accordance with amended specifications \$2.37 and \$2.24 per pair, and as per sample No. 1 \$2.55, sample No. 2 \$2.24, and sample No. 3 \$2.44 per pair. Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana, 9,410 pairs only at \$26,217 as per sample; The Southern Sales Co., Akron, Ohio, 24,000 pairs only at \$56,400.

War News of the Rubber Industry.

THROUGHOUT the country the rubber industry is answering nobly to the nation's call in a great emergency.

Many of its young men, including heads of companies, have voluntarily enlisted in various branches of military service, and thousands more will respond proudly to the selective draft. Leaders of the rubber trade are devoting their time, energy and expert knowledge without stint or compensation to the grave problems concerning the maintenance of the industry, the immediate and constant supply of government needs, and the care of war dependents. Concerns, large and small, and individuals whose duty lies in continuing their usual daily tasks with redoubled zest and efficiency have, even to the humblest worker, subscribed to the Liberty Loan and contributed to the Red Cross with eagerness and generosity. Thriving Akron, Ohio, with its large and growing foreign population has gone on record for a higher honor than that of merely being the rubber city of the United States.

Would that press dispatches made possible a complete statement of what has already been accomplished, but it is hoped that the editorial request for facts on another page of this issue will meet with wide response in order that this permanent monthly record of honor may leave unmentioned no act of loyalty and patriotism, corporate or individual, that will tend to maintain the present enthusiasm for the ultimate victory of the democratic peoples of the world, whatever sacrifices and hardships may intervene.

THE LIBERTY LOAN.

The rubber concerns of the country looked upon the floating of the Liberty Loan as at once a duty and a privilege. Several of them invested heavily and practically all did something. Many also negotiated bonds for their employes on a deferred payment plan to enable them to participate in the loan as a form of weekly savings. The appended list records only such instances as have come to our attention through letters and the daily press. It is far from complete and it would be a pleasure to list the total subscription for every firm in the industry.

The United States Rubber Co., New York City, heads the list with a total subscription of \$2,400,000, of which \$1,000,000 was taken by the firm and the balance by employes in the various factories and sales offices in different parts of the country.

Akron, Ohio, raised approximately \$4,000,000, or \$300,000 more than her quota, and outranks Cleveland and all other Ohio cities in per capita subscriptions. There are 40,000 subscribers, which means that one in every three persons contributed to the purchase of the bonds and that virtually every family of this cosmopolitan city is represented. It is estimated that close to 1,500 foreigners have contributed to the Liberty Loan Bonds.

Reports show that 7,000 employes of The B. F. Goodrich Co. took about \$750,000 worth of bonds.

Not less than 11,000 persons in the employ of The Goodyear Tire & Rubber Co. became bond buyers, the total subscription being about \$675,000.

Only five men of the 300 employes of the Mohawk Tire & Rubber Co. had not subscribed on June 14, and it is probable that they did so the last day, making a 100 per cent record for this firm.

The Firestone Tire & Rubber Co. encouraged every employe to subscribe to the extent of his ability and arranged

for payment at the rate of \$1 per week for those not able to comply with the government's terms.

F. W. Plant, president of the Plant Rubber Co., Minneapolis, Minnesota, served on a special committee to promote the sale of Liberty Bonds. Among the rubber jobbers who subscribed were the Plant Rubber Co., \$10,000; W. S. Nott Co., \$10,000, and the Minnesota Rubber Co., \$500. The employes of the Plant Rubber Co. subscribed \$3,000 on a deferred payment plan.

The Federal Rubber Co., Cudahy, Wisconsin, took a large block of bonds and worked out a plan whereby even the humblest worker might become the possessor of at least one bond.

The Simplex Wire & Cable Co., Boston, Massachusetts, bought \$50,000 worth of bonds and enabled their employes to subscribe at the rate of \$1 a week without charging any extra interest.

The Ajax Rubber Co., Inc., New York City, subscribed \$100,000 on its own account in addition to between \$300,000 and \$400,000 bought by employes.

The Republic Rubber Co. employes, Youngstown, Ohio, took advantage of the firm's deferred payment plan and subscribed generously.

Nearly 500 employes of The Fisk Rubber Co., Chicopee Falls, Massachusetts, bought over \$85,000 worth of bonds on a deferred payment plan of \$1 per week for each \$50.

On June 7 the employes of the Tyer Rubber Co., Andover, Massachusetts, had subscribed over \$16,000, some departments making records of 100 per cent.

The Davol Rubber Co., Providence, Rhode Island, subscribed for \$25,000 of the bonds, which have been sold to its employes on the weekly payment plan.

The Monatiquot Rubber Works Co., South Braintree, Massachusetts, offered its employes an opportunity to buy bonds on convenient terms, and the result was a subscription of \$60 per capita.

The staff of THE INDIA RUBBER WORLD subscribed \$11,560.

ALLIED INDUSTRIES ACTIVE.

Forty thousand employes of the General Electric Co. subscribed \$2,955,550. This total includes the subscriptions of general offices, district offices, the works at Schenectady, Lynn, Pittsfield, Erie and Fort Wayne, the Edison lamp works, Sprague works and National lamp works.

The Westinghouse Electric & Manufacturing Co. also negotiated bonds for all employes wishing to subscribe on monthly and semi-monthly instalments.

RUBBER MEN IN MILITARY SERVICE.

H. Wilfred du Puy, president and treasurer, and Charles M. du Puy, vice-president of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, are in active service and now stationed at Fort Niagara.

One hundred and twenty-five men have left The Goodyear Tire & Rubber Co., Akron, Ohio, to enter Federal service; a part of them are members of the Guard of West Virginia. An even larger number will leave in July, when the Ohio National Guard will be called to the colors.

Fifteen men in the employ of F. H. Appleton & Son, Boston, Massachusetts, have enlisted, ten of them in Captain Appleton's own company.

Harold H. Everett, Mansfield, Massachusetts, for some time connected with the Boston office of The B. F. Goodrich Co.,

Akron, Ohio, has enlisted in the infantry and is now in training at Fort Slocum, New York.

Albert E. Plumb, B. C., has resigned from the laboratory staff of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, to enlist in the United States Army.

P. D. Jamieson, who was in charge of the footwear department at the Halifax branch of the Canadian Consolidated Rubber Co., Limited, is in training for overseas service at St. John's, P. Q.

INCREASING THE FOOD SUPPLY.

H. S. Firestone, president of the Firestone Tire & Rubber Co., Akron, Ohio, is personally superintending the care of 350 war gardens, 50 by 100 feet, which have been established by employes on 70 acres of land furnished by the company. The company provides the seed, and in order to insure maximum production an expert gardener has been employed to instruct the men in intensive farming.

President Rieder of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, has announced that, notwithstanding the fact that the company has orders on hand which would keep all the factories busy throughout the summer, all the factories would close one full week during the busy harvest season, so that farmers can be provided with help at that time.

THE RED CROSS.

The rubber industry is already responding generously to the appeal of this humanitarian cause. The customary Rubber Club outing has been abandoned, the money usually subscribed for the purpose probably to be contributed to the Red Cross. Leaders in the rubber industry in the several centers have taken the initiative, encouraging participation for employer and employe alike and conducting spirited, well-organized campaigns, as did New England for the Liberty Loan under the able leadership of Frederic C. Hood.

As a result of a four days' campaign early in June 98 per cent of the force of The Goodyear Tire & Rubber Co., Akron, Ohio, became members of the Red Cross. In all 17,865 new members were enrolled and a like number of dollars were contributed to the cause. This brings the total membership of Akron up to 40,000, or about 35 per cent of the city's population.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, was among the early subscribers during Red Cross Week, having contributed \$10,000.

By an overwhelming majority the employes of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, voted to abandon the annual outing provided by the company and to devote the appropriation of \$1,200 to the Red Cross. The company regards this not as its own gift, but as a contribution from its employes, whose generous and patriotic sentiment made possible the offering to a deserving cause.

A number of industrial corporations have declared special dividends, which they recommended be turned over to the Red Cross fund. Among these are the Ajax Rubber Co., Inc., New York City, \$14,200, and the Westinghouse Electric & Manufacturing Co., \$375,000. The General Electric Co. dividend for this purpose was \$1,000,000.

AKRON HAS A BIG PATRIOTIC DAY.

On May 28 the largest patriotic gathering ever held in Akron, Ohio, occurred in connection with the raising of the huge American flag which was purchased by popular subscription among the employes of The B. F. Goodrich Co. All of the officers of the company were present and Hon. Myron T. Herrick, former Governor of Ohio and recently Ambassador to France, was the speaker of the day. Homer H. McKeehan, of Cleveland, Ohio, also delivered a stirring address and a salute was fired by the firing squad of the Eighth Ohio Regiment of the National Guard.

The entire city took active part in the ceremonies, which were preceded by a parade three miles long. Every fraternal, civic, military and foreign organization was represented. For the first time in their history the Knights Templars took part in a public parade, wearing their full regalia. The Knights of Pythias, Knights of Columbus and the Odd Fellows appeared with their full uniformed ranks. A hundred thousand men, women and children of Akron and surrounding towns

IMMENSE FLAG RAISED BY GOODRICH WORKERS.

lined the route of march and 25,000 more filled the Goodrich Field to its capacity.

The most impressive scene during the parade was a division of foreigners headed by a band. Twenty-four different nationalities were represented in this division alone, and several foreign societies had called out hundreds of their members, who formed another division of their own. The impression made by this great demonstration upon the foreign-born population of the city was particularly noteworthy.

The Boy Scouts of Akron exhibited wonderful efficiency in aiding the city's police department in controlling the large crowds along the line of march and at the field.

COUNCIL OF NATIONAL DEFENSE.

As time passes it becomes increasingly evident that the Council of National Defense, not Congress, is putting the country on a war basis. Non-political business efficiency characterizes its every act, for the men composing it represent the best paid brains of America—manufacturers, captains of industry, railroad heads, labor leaders, professional men, experts of every sort whose ordinary incomes range anywhere from \$5,000 to \$100,000, who have placed their specialized ability at government service without compensation and in most instances are not even presenting expense bills. Such free tender of highly specialized service enables them to demand practical patriotism from others, and when they award contracts the plea for war profits goes unheeded. The advent through them of system, cooperation, standardization, adaptation of method to circumstance and introduction of reasoned order and priority into war tasks have wrought a veritable revolution in our national government which augurs well for the efficient conduct of the war.

The Council of National Defense itself consists of only six Cabinet members, while the Advisory Commission includes seven civilians, each a leader in his field. But so greatly have the Sec-

ments and Boards of the Council and the Committees and Co-operative Committees of the Commission developed that a pamphlet of 26 pages is required to list the members of this great organization. This list reads like a "Who's Who of Big Business," and many of the names are well known to the rubber and allied trades.

The Co-operative Committee on Rubber consists of H. Stuart Hotchkiss, president General Rubber Co., chairman; Frederic C. Hood, Hood Rubber Co., and Arthur H. Marks, The B. F. Goodrich Co.

The Co-operative Committee on Chemicals consists of Dr. William H. Nichols, General Chemical Co., chairman; Van H. Manning, Bureau of Mines; C. A. Richards, Department of Commerce.

Among the eight subcommittees may be mentioned that on acids, consisting of H. R. Grasselli, Grasselli Chemical Co., and Henry Howard, Merrimac Chemical Co.; that on alkalis with J. D. Pennock, Solvay Process Co., chairman; that on coal tar by-products with William H. Childs, president Barrett Co., chairman; and that on sulphur with Henry Whiton, president Union Sulphur Co., chairman.

Edgar Palmer, president New Jersey Zinc Co., heads the Co-operative Committee on Zinc consisting of eight members.

The Co-operative Committee on Copper consists of seven members, with J. D. Ryan, president Anaconda Copper Co., as chairman, while the Co-operative Committee on Lead includes six members headed by Clinton H. Clark, president St. Joseph Lead Co.

Lincoln Grant, of Wellington, Sears Co., heads the Co-operative Committee on Cotton Goods of thirteen men, among whom may be mentioned Harry L. Bailey, also of Wellington, Sears Co., and Spencer Turner, of Turner, Halsey Co.

Thomas F. Manville, president of H. W. Johns-Manville Co., is chairman of the Co-operative Committee on Asbestos, Magnesite and Roofing.

Theodore N. Vail, president of the American Telephone & Telegraph Co., is chairman of a committee of five on telegraphs and telephones.

F. C. Pratt, of the General Electric Co., heads a subcommittee of the General Munitions Board on gages, dies, etc.

L. A. Osborne, vice-president of the Westinghouse Electric & Manufacturing Co., is chairman of the Co-operative Committee from the National Industrial Conference Board.

THE CARE OF ARMY AND NAVY DEPENDENTS.

IN response to the request of Secretary of War Baker to investigate the matter of voluntary civilian assistance in the care of dependent families of enlisted men in the military and naval forces, a committee of the Chamber of Commerce of the United States, of which F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, is chairman, has made recommendations which must be regarded as good and fair to all. It is suggested that the government enact legislation providing for reasonable separation allowances similar to those adopted by England and Canada, and further, that the government officially designate some national organization to raise a general fund by voluntary public subscription and in co-operation with representative local bodies to distribute it for the alleviation of conditions not adequately met by national or state allowances. The committee urges prompt action by the government and speedy publication of the general plan, pending which employers should make only temporary commitments to the dependents of their operatives who enlist, it being realized that the smaller employers, who are in the majority throughout the country, cannot follow the lead of large firms and assume this burden generally or indefinitely without hardship and embarrassment.

In Great Britain there are two sources of revenue for dependents:

First, the family receives from the government a separation allowance of \$2.25 a week for the wife or mother, \$1.25 for the first child, 84 cents for the second and 50 cents for each additional child. Widowed mothers and dependent sisters of single men are entitled to separation allowances where pre-enlistment maintenance existed.

Second, the soldier or sailor may allot part of his military pay, not exceeding three-fourths, for the support of dependents. In addition, and within certain limits (\$3 a week for a private or corporal; \$3.60 for a sergeant; \$3.96 for a company quartermaster sergeant; \$5.28 for a warrant officer, Class 2, and \$5.52 for a warrant officer, Class 1), the government will assist an unmarried soldier to continue the support he formerly gave dependents, not including his own maintenance, provided he will contribute approximately one-third of the amount (84 cents a week for private or corporal; \$1.40 for a sergeant, etc.) by allotment from his military pay, the government paying the balance. No person who is entitled to a separation allowance as the wife or child of a soldier can draw an allowance as a dependent in addition.

These allowances do not eliminate the necessity for relief efforts on the part of public organizations, such as the Soldiers' and Sailors' Relief Society, etc., whose voluntary workers and local committees take care of cases seeming to demand special assistance.

In Canada there are three sources of revenue for dependents:

First, a portion of the soldier's or sailor's pay, the percentage determined by individual conditions, is deducted and sent to his dependents.

Second, the government makes a separation allowance intended to enable dependents to approximate the pre-enlistment maintenance standard. This represents a flat sum of \$20 each for the wife and each child regardless of the size of the family.

Third, there is a National Patriotic Fund, raised by voluntary public subscription and distributed by a corporate organization authorized by the government. This fund takes care of necessitous cases where local investigation seems to establish the need of it.

SCHEDULES OF PAYMENTS TO CANADIAN DEPENDENTS.

	Government Separation Allowance.	Assigned Pay.	Patriotic Fund.
Wife, having no children.....	\$20	\$15 or more	\$5.00
Wife and one child—			
Child under 5 years.....	20	15 or more	13.00
Child under 10 years.....	20	15 or more	14.50
Child under 15 years.....	20	15 or more	17.50
Wife and two children—			
If both under 5 years.....	20	15 or more	16.00
If one under 5 and one under 10.....	20	15 or more	17.50
If both under 10 years.....	20	15 or more	17.50
If both under 15 or one less and one more than 10.....	20	15 or more	22.00
Wife and three children—			
If all are under 5 years.....	20	15 or more	19.00
If all three are under 10 years.....	20	15 or more	20.50
If all three are under 15 years.....	20	15 or more	25.00

This scale continues up to the case of a wife with seven or more children. In such cases the maximum allowance from the Patriotic Fund is \$30 per month, regardless of the number or the ages of the children.

WIDOWED MOTHER. If she depended entirely for support on an unmarried son who has joined the Canadian Expeditionary forces, she may, if in need, receive from the Canadian Patriotic Fund a monthly allowance not to exceed \$10.

PARENTS. If the parents of a soldier in the Canadian Expeditionary forces are both old and incapable of work, and if they were entirely dependent on the soldier, they may, if in need, receive from the Canadian Patriotic Fund a monthly allowance not to exceed \$20.

Owing to the high cost of living the allowances in both countries have been found inadequate, and readjustments are now contemplated, their fundamental aim being to establish equality in the basis of service in the ranks; to equalize the burden upon industry and people; to avoid duplication of

patriotic organizations and funds, and to combine all the machinery of family maintenance with an eye to the psychological effect upon the soldier at the front. The plan of the United States when finally adopted will certainly not fall short of that of either England or Canada in generosity.

SENATE REMOVES ALL RUBBER DUTIES AND TAXES.

AS revised by the Senate Finance Committee, following a hearing granted to the Legislative Committee of The Rubber Association of America on May 5, the proposed 10 per cent ad valorem tax has been struck out of the War Revenue Bill now before Congress, and the Senate bill, as it now stands, provides for no duty on crude rubber nor tax on tires or other rubber manufactures. Instead, a tax will be imposed on automobile owners, the amount to be determined by the price of the car and the number of years it has been in service. It is the general belief that these provisions will be concurred in by the House and enacted into the final law.

At the hearing representative rubber men expressed their willingness to be taxed, but united in opposing the House proposal of double taxation on tires and a ten per cent duty on crude rubber, in addition to the general tax on corporations.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, Ohio, stated that the rubber industry is very glad to be taxed its full share and, he thought, a little more. He pointed out, however, the injustice of singling out tires, representing \$250,000,000 out of a \$600,000,000 annual business, for double taxation; made it clear that tires can no longer be regarded as a luxury, and advocated a 5 per cent war tax on all rubber manufactures as being more equitable and raising more revenue than a 10 per cent ad valorem import duty on crude rubber. The latter provision, he stated, would curtail importation and greatly increase the difficulties in the way of replenishing the present depleted American stocks, all of which have to be brought from the other side of the world, notwithstanding the submarine menace and the shortage of ships.

H. Stuart Hotchkiss, chairman of the Rubber Committee of the Council of National Defense, emphasized the seriousness of the present crude rubber situation in the United States, pointing out that whereas in normal times there is three months' supply of rubber at the mills, at present there is only 30 days' supply, with 17 days' supply in transit and 29 days' supply permitted at ports of origin. He also voiced the fear that an import tax in the circumstances might tend to curtail importations at a time when they are absolutely essential as a matter of national insurance.

Former Congressman Martin W. Littleton, of New York City, spoke for the retention of the original tariff free list, and suggested various amendments to raise the desired revenue without resorting to the crude rubber import duty, among them a 5 per cent tax on all rubber manufactures as well as tires.

GUTTA PERCHA USED IN ORDNANCE MAKING.

That rubber occupies a prominent position in the list of materials indispensable in modern warfare is a well-known fact. While the peculiar properties of gutta percha have made it a valuable material in the manufacture of various war supplies, it is now found useful in the manufacture of ordnance.

Gutta percha is used for the purpose of making a critical examination of any desired surface of the interior of the bore of rifle cannons. In order to do this, a block of wood is prepared so that one side approximately fits the bore at the part to be examined. This surface of the block is then coated with gutta percha and heated so that when it is inserted in the bore and forced against the part to be examined, it makes a negative

reproduction of the surface of the bore. The block of wood is allowed to remain until the gutta percha is cooled, when it is removed and usually photographed for the purpose of detecting defects in the gun.

AMERICAN "BLIMPS" A SUCCESS.

NAVY officials, enthusiastic over the successful builders' trial of the first 16 non-rigid dirigible balloons ordered three months ago, say that the dirigible program is now assured of completion much sooner than had been expected. The contract called for delivery within four months, but the builders are turning the first ship over for active duty within less than 90 days of the date of the contract, and henceforth one or more will be delivered every week.

The trip of 16 hours from Chicago to Akron covered more than 400 miles. It was made under direction of the builders, the Goodyear Tire & Rubber Co., Akron, Ohio, and did not constitute an official test, but was so successful that navy offi-

BLIMP MANUFACTURED BY THE CONNECTICUT AIRCRAFT CO.

cial are confident a valuable type similar to the "Blimp" of the British navy had been produced which will make the required forty miles an hour at official trials.

The ship was designed by Naval Constructor J. C. Hunsaker, of the Bureau of Construction and Repair, and the unofficial test is regarded as having proved conclusively that the weight problem has been solved.

Of the 16 dirigibles contracted for by the government the Goodyear company is constructing nine and the others are being built by The B. F. Goodrich Co., Akron, Ohio, the Curtiss Aircraft Co., Hammondsport, New York, and the Connecticut Aircraft Co., New Haven, Connecticut.

The American "Blimps" will form a part of the coast patrol as lookouts to watch for the approach of enemy vessels. Crews are being trained at the naval aviation station at Pensacola, where the first dirigible, DN-1, an older type craft, suitable only for training purposes, is in daily operation.

The new airships have greater speed and greater weight-carrying capacity, and are expected to be an effective element of the coast defenses, particularly in the detection of submarines, in which service the British "Blimps" have repeatedly proven their value.

The Navy Department expects that the entire 16 will be in service by the middle of August, and that they will be distributed to operate in pairs along the Atlantic coast, working from special bases ashore and supplementing the operations of submarine chasers, reserve destroyers and other naval craft now on guard duty.

DAMP PROOF UNIFORMS.

Because of the dampness of the trenches, single texture fabric is now advocated for soldiers' uniforms. The suggestion is that the garments be made in such manner as to render them moisture proof, yet not air proof.

3,500 AIRPLANES FOR 1917.

AIRCRAFT production and the training of aviators is to be one of America's chief early contributions to the war. Announcement has been made that the Aircraft Production Board, under the direction of Howard E. Coffin, is to construct 3,500 war airplanes and train 6,000 aviators this year, and that the output will be at least doubled next year.

British and French authorities regard American aero service as the greatest assistance that can be rendered quickly, and the recent success at Messines, indicating indisputably the decisive part played by airplanes in modern warfare, seems to forecast the passage, in part, at least, of the Shepard-Hulburt bill creating a separate aviation department of the government and calling for \$500,000,000 to \$1,000,000,000 for a great air fleet.

The unjustifiable German air raids over London recently are regarded as a trap to draw British machines from the western front and to break Field Marshal Haig's present aerial supremacy.

The Aircraft Production Board is working in conjunction with the Aero Club of America in advocating that the United States must strike Germany through the air. Military authorities agree that, in addition to airplane reconnaissance and mapping by photography, air raids on a large scale will blind German batteries, destroy supplies and prevent German airplane operations over the Allies' lines. The task of the Aero Club, therefore, according to present plans, is to recruit and train 10,000 or more aviators to fly the tens of thousands of airplanes which the Aircraft Production Board contemplates constructing. These airplanes will be of several different types for training, bomb dropping, artillery spotting, sighting and submarine destroying.

This first instalment alone represents a considerable quantity of rubber manufactures. Rubberized fabrics of flax or linen and sometimes of cotton or ramie are used for covering the sustaining surfaces; the supporting wheels are pneumatic tired; springs or shock absorbers of molded rubber, sometimes in the form of rings, protect machine and aviator from too violent shocks when leaving and returning to earth; the delicate mechanism of navigating instruments is protected from excessive vibration and sudden shock by soft, elastic rubber attachments which hold them in place; and the upholstering of the aviator's seat is often of rubberized fabric inflated with

men are not agreed as to design and requirements. The American Rubber Co., Boston, Massachusetts, which not only manufactures balloon fabrics, but also an extensive line of coated

AVIATOR'S UNIFORM, DESIGNED BY THE AMERICAN RUBBER CO.

fabrics and rubberized clothing, has been working out the airman's problem. The requirements for flying over water are different from those over land. The outfit designed for the former comprises three uniforms. The first is a two-piece suit of drab wool khaki, much like the regulation army uniform, but double-breasted to give greater warmth. The second is a one-piece garment—really an overgarment covering the other suit, and lacing below the knee. This is made of double texture fabric, making a windproof and waterproof covering. Over this may be worn the safety jacket, the outside of which is also of double texture fabric. There is an inner collar with draw string, and outside collar of corduroy, and the sleeves are provided with wind cuffs. This is fastened to an inner jacket, lined or filled with kapok, which, because of its buoyancy, will act as a life preserver if the airman falls into the water. The illustration shows an aviator thus appareled. Although the outfit is bulky, it gives the wearer full use of his arms and legs without restraint.

Courtesy of The Aerial Age

THE NEW CURTISS TRIPLANE. LATEST DEVELOPMENT OF THE ARMY AIRPLANE.

air. Repairs and replacements, particularly tires, must be provided for as well as the initial equipment. The outfitting of 6,000 aviators is in itself no small matter, including elastic safety belts, hard rubber helmets, rubberized suits and gloves as a protection from cold and rain.

There is at present no standard uniform for aviators. Air-

A new suit for overland flying is made of single texture cravenette. It is of the one-piece model, with a lined underwaist. The suit has slashed pockets at breast and sides, and is belted. A novel feature is the fastening, which does away with all buttons, buckles or lacings. It is a patented fastening, a lattice of little wires on either edge of the opening. When a sliding key is pulled up, the lattice interlocks; when pulled down it is unlocked. The operation is practically instantaneous, a point of value when time is precious.

These suits are the result of careful study of all the peculiar requirements, and have received the approval of a large number of veteran airmen.

CABLES TO THE FORCES IN FRANCE.

The Western Union Telegraph Co. has made special arrangements under which week-end letter cablegrams of a social character may be sent to soldiers, sailors and nurses of the American expeditionary forces in England and France, such cablegrams to be charged on a word basis within the minimum charges applicable in the case of ordinary week-end cablegrams. These messages will bear the indication "EFM," which will be counted and charged for, and must be addressed "Amexforce, London," and in addition must contain the addressee's name, the name of the regiment, ship or number of the unit with which the addressee is serving, all messages to be accepted at sender's risk, subject to censorship and delay. Similar arrangements have been made for the acceptance of messages from members of the expeditionary forces in England and France to their friends and relatives in the United States. These week-end letter cablegrams to and from France will be handled by post between London and

France. The rate will be five cents per word from New York City, including the indication "EFM," name, address and signature.

THE RUBBER TRADE ROLL OF HONOR.

ONE of the greatest privileges that can come to a nation, an industry, a family, is the despatch of its young manhood to battle for its honor, perhaps for its existence. In this war, which was not of our seeking, but from which there was no righteous escape, many are offering that personal service that means privation and peril certainly, and possibly wounds and death. It is an honorable service in a cause that history will write down as glorious.

In the columns below will appear from time to time the names of the men who constitute the Roll of Honor of the American Rubber Trade. We name them with pride, these willing, stalwart members of the great and potent Army of Freedom:

TIRES FOR THE NEW MILITARY TRUCKS.

THE new American army will be supplied with motor trucks as rapidly as they are needed, through the development of the government's present plans. Bids have already been asked on orders of from 1,000 to 35,000 trucks of 3- and 5-ton types, known officially as Class "A" and Class "B," and present estimates indicate that they can be secured from the existing manufacturing plants as fast as they are required.

The specifications for these new trucks were formulated by the War Department Motor Transport Board, of which Colonel Chauncey B. Baker, Q. M. C., is the head, in conjunction with several divisions of the Standards Committee of the Society of Automotive Engineers. Standard tire specifications follow:

CLASS A GASOLINE TRUCK TIRES.

253. On two-wheel drive trucks the tires shall be 36 by 7-inch single tires on rear wheels, and 36 by 4-inch single tires on front wheels, both front and rear tires demountable.

254. On four-wheel drive trucks the tires shall be 36 by 6-inch single, demountable, both front and rear.

255. All tires shall be best quality solid rubber tires on hard rubber base with S. A. E. steel rims. A sample section of the rubber tires and rim must be submitted with each proposal. All tires furnished must be in strict accordance with "Specifications for the Furnishing of Solid Rubber Tires" issued by the Office of the Quartermaster General.

CLASS B GASOLINE TRUCK TIRES.

On two-wheel drive trucks the tires shall be 36 by 5-inch dual tires, or 36 by 10-inch single tires on rear wheels, and 36 by 5-inch single tires on front wheels, both front and rear tires demountable. The 36 by 10-inch single tires are preferred. These tires must be interchangeable with 36 by 5-inch dual equipment.

S. A. E. TIRE AND RIM DIVISION REPORT.

THE following important report of the tire and rim division of the Society of Automotive Engineers has been approved by the Standards Committee, and will undoubtedly be adopted by the society. The report recommends that the standard specifications for demountable tire and rim equipment and fastenings for the 1½- and 3-ton military trucks, designated as Class A and Class B, respectively, shall be as follows:

1. Felloe bands and nominal tire diameters are to conform to S. A. E. standard specifications.

2. A type of tire channel shall be used that will permit of one size of wedge ring being used for both single and dual equipment, regardless of sectional size; also one standard section of center wedge ring for use between dual tires of all sectional sizes.

3. Side flanges shall be used, having the S. A. E. standard bolt circles. Flanges shall be provided with bolt-holes in ac-

S. A. E. DEMOUNTABLE RIM FASTENINGS FOR CLASS A AND B MILITARY TRUCKS.

cordance with S. A. E. standards, the 36-inch with 12 holes and the 40-inch with 15 holes. These flanges shall be provided with bolt holes $9/16$ inch square, with spherical counterboring that will permit them to be used for either inside or outside flanges. See Figs. A and B.

4. Side wedge rings shall be as per Fig. C, or equivalent.

5. Center wedge rings shall be as per Fig. D, or equivalent.

6. Ends of all side wedge rings shall be cut as per Fig. E, or equivalent.

7. All nuts shall be as per Fig. F, or equivalent, preferably case-hardened.

8. Referring to Fig. F, bolt heads shall be made to conform to the square hole and the spherical counterboring in the side flanges, Fig. A. The lengths shall be according to the following table:

Tire Section.	Single.	Dual.
4	4 3/8	9 1/2
5	5 5/8	11 1/2
6	6 5/8	13 1/2
7	7 5/8	15 1/2

All bolts $1/2$ by 13 U. S. S. threaded $1/4$ -inch minimum.

9. Contours of the underside of tire channels shall be equal to or interchangeable with the contours shown in the lower illustration.

10. It is understood that the present tire sizes in the military truck specifications are:

36 by 4 inch, single	36 by 7 inch, single
36 by 5 inch, single	36 by 5 inch, dual
36 by 6 inch, single	36 by 6 inch, dual

CARRYING CAPACITIES AND INFLATION PRESSURES OF PNEUMATIC TIRES.

The division recommends that the inflation pressures given in the following table be standardized, the loads per tire and the pounds per square inch inflation being maximum values.

Size of Tire, Inches.	Maximum Load, Pound per Tire.	Maximum Inflation Pressure, Pound per Square Inch.
3	375	45
3 1/2	570	55
4	815	65
4 1/2	1,100	75
5	1,300	80
5 1/2	1,700	85
6	2,000	90

S. A. E. DEMOUNTABLE RIMS FOR CLASS A AND B MILITARY TRUCKS.

What the Rubber Chemists Are Doing.

CATALYTIC ACCELERATION OF VULCANIZATION.

IN the "Journal of the Society of Chemical Industry," April 30, 1917, S. J. Peachey discusses organic accelerations with special reference to para-nitrosodimethylaniline discovered and patented by him as an accelerator of the vulcanizing process. [English patent No. 4,263 (1914).]

Extracts from the original paper and discussion follow:

Generally speaking, the addition of 0.3 to 0.5 per cent of nitroso-base to any mixing of good quality is sufficient to reduce the time of vulcanization from one-quarter to one-third of that normally required. The nitroso-base is now being employed successfully under the trade name of "Accelerene."

p-Nitrosodimethylaniline is a green crystalline powder of melting point 85 degrees C. It is usually marketed in a moist condition (about 30 per cent of water), this adding considerably to its stability and rendering it safer to store in bulk. Before use it may conveniently be dried by exposure to warm air, or preferably in a vacuum dryer. It should be incorporated with the rubber towards the end of the mixing operation, as there is otherwise some danger of a partial vulcanization taking place on the rolls.

The time required for curing the mixing may be roughly calculated on the assumption that the use of 0.5 per cent (on the weight of the mixing) of nitroso-base reduces the time of cure to one third of the normal. In the case of red mixings containing antimony sulphide as the vulcanizing agent without added sulphur, the accelerator fails to develop its full effect. In such cases it becomes necessary to introduce a certain quantity of sulphur, mainly as pigment. The presence of litharge in any quantity tends to diminish the effectiveness of the organic accelerator. The presence of a small quantity of magnesia augments very considerably the accelerating power of the nitroso-base, and by using the two substances in suitable proportions it is possible to prepare high-class mixings which will vulcanize perfectly in about one-eighth of the normal time, or about ten minutes.

It is to be noted that the maximum accelerating power of *p*-nitrosodimethylaniline is only fully manifested when new rubber is used; with reclaimed rubber or rubber waste the results obtained are not very satisfactory.

One of the most valuable applications of the new accelerator is in the manufacture of vulcanite. A pure vulcanite mixing of 100 parts rubber and 40 parts sulphur normally requires about six hours to cure. Such a mixing, by the addition of 0.6 to 0.75 per cent of nitroso-base, can be perfectly cured in two hours.

The nitroso-base effectively obviates "blooming" or "sulphuring-up." In such case there is little or no reduction in the time of vulcanization owing to the diminished proportion of sulphur present, the power of the catalyst being expended in bringing about practically complete combination between the molecules of the rubber and the sulphur.

It is fairly generally accepted that vulcanization by Good-year's process involves the following changes:

1. Depolymerization by heat of the complex rubber molecule.
 2. Adsorption of sulphur by the rubber colloid.
 3. Combination of the depolymerized rubber with sulphur.
 4. Repolymerization to complex molecules as a result of (3).
- The final product—the vulcanized rubber—is regarded as being a solid (or semi-solid) solution of the compound of rubber and sulphur in unchanged rubber.

The newly discovered organic accelerators differ from the so-called sulphur carriers in that an exceedingly small quantity of material is effective in bringing about a very powerful acceleration, evidently of a catalytic nature. The main characteristics of catalytic actions are that the catalyst is usually present

in relatively small concentration and that it does not start a reaction, but only accelerates a change which can proceed by itself. Taking *p*-nitrosodimethylaniline as an example, its presence in one two-hundredth of the mass of the reacting substances is sufficient to treble the speed of the reaction. The internal heat theory cannot possibly apply here. The accelerating effect of these nitroso-bases is in some manner bound up with the presence of a nitroso group directly linked up with the nucleus.

It is important to note that the catalytic action of *p*-nitrosodimethylaniline appears to differ entirely in mechanism from that of piperidine and of the other bases covered by Bayer's patents. The latter appear to act by virtue of their powerful basic character. *p*-Nitrosodimethylaniline is a very feeble base with a dissociation constant far below that quoted in Bayer's patent. The accelerators discovered by the author constitute a new class and appear to owe their accelerating power to the presence of the nitroso group.

The author in his experiments found that certain organic compounds possess the property of retarding vulcanization, apparently acting as anti-catalysts. Phenylhydrazine is an example. Other substances behave similarly, notably glucose and methylene blue.

In reply to discussion of his paper the author further explained his researches on accelerators in part as follows:

Not much progress has been made as regards the possibility of detecting the nitroso-base in the vulcanized rubber, but the acetone extract of such a rubber is always so lightly colored that in the absence of anything else which would yield a dark color, that alone would suggest the use of the accelerator.

If rubber were heated with nitroso-base a tarry mass was formed; there was no evidence of vulcanization.

With regard to the prejudicial effect of *p*-nitrosodimethylaniline upon the health of workers using it, it was largely a question of the impurities originally present in the nitroso-base and the pure material is not so objectionable as the crude.

Regarding the stability of vulcanized rubber, samples have been kept for two years or more. Except in the case of a few which were not more than 0.1 millimeter thick there has been no deterioration.

The strength tests carried out with material vulcanized in conjunction with the accelerator gave better results than those obtained with material normally vulcanized as nearly as possible in the correct time to give the same cure. There appeared to be a uniform slight increase in strength as the result of using the accelerator, but the experiments must be confirmed on a very large number of samples.

PLANTATION FACTORY PRACTICE IN RELATION TO VULCANIZATION TESTS.

Bulletin No. 27 of the Ceylon Department of Agriculture, entitled "Vulcanization Tests," details the results of investigations at the Imperial Institute on samples of plantation *Hevea* rubber prepared by L. E. Campbell, B.Sc., the rubber research chemist.

For comparison the experiments were conducted in duplicate with latex from 7-year trees and also from trees 16 to 20 years old. The 88 specimens dealt with were prepared with the object of studying the effect of (1), the smoking of sheet rubber; (2), the addition of alkaline creosote solution to the latex before coagulation; (3), the Brazilian, Wickham and Byrne processes; (4), the rolling up of plain sheet and smoked sheet rubber, both dry and wet, with and without tension; (5), the conversion of crêpe rubber into wet and dry block, and (6), the separation of the rubber from the latex in successive portions.

The conclusions were summarized as follows:

(1) Spontaneous coagulation of the latex usually yields rubber of good quality, but the method is scarcely suitable for practical use.

(2) Scrap rubber from the trees has invariably given a low tensile strength after vulcanization.

(3) Acetic acid is quite satisfactory as a coagulant, and, so far as the vulcanizing and mechanical properties of the rubber are concerned, there would appear to be no advantage in using any other acid in place of it.

(4) Plain unsmoked sheet rubber is usually of excellent quality, the unvulcanized product having, as a rule, a tensile strength of 2,300 to 2,400 pounds per square inch. The rubber also cures fairly rapidly, the average time under the conditions of the present series of tests being about 70 minutes.

(5) Crêpe rubber invariably takes a much longer time to cure (105 to 130 minutes) than the corresponding plain sheet from the same latex, and this effect is brought about even if the freshly coagulated rubber is only passed through the rough rollers four times. The mechanical properties of crêpe rubber after vulcanization are very frequently inferior to those of the corresponding plain sheet.

(6) The "over-working" of the freshly coagulated rubber in the preparation of crêpe (up to 70 times through the rough rollers) has very little effect on the mechanical properties of the vulcanized rubber, and only slightly increases the time of cure, compared with that of crêpe made by passing through the rough rollers only 5 or 7 times.

(7) Thick crêpe rubber, made by rolling together several pieces of thin crêpe, does not differ from the latter in time of cure, and the differences in tensile strength are not very marked or constant. Thick crêpe, made by rolling out the coagulum to the required thickness, usually cures in a shorter time than the corresponding thin crêpe.

(8) Different methods of drying (air-drying at the ordinary temperature, drying in hot air, and in vacuo) have very little effect on the time of cure or the tensile strength of the rubber.

(9) The smoking of sheet rubber increases the time of cure very considerably, and in some cases appears to affect adversely the mechanical properties of the vulcanized product.

(15) It is not possible at present to suggest a method of obtaining rubber with a uniform rate of cure, as samples made under exactly similar conditions at different times vary considerably in this respect. The bulking of the product obtained over a considerable period would appear to be the only practicable way of approximating to this result, until further research has thrown more light on the fundamental condition in rubber which influences rate of cure.

COMMITTEE D-11 ON RUBBER PRODUCTS.

At the meeting of the American Society for Testing Materials held at Atlantic City, New Jersey, June 26-29, 1917, the various sub-committees of Committee D-11 on rubber products reported progress only on their assignments, except sub-committee 1 on air hose, which offered a tentative specification on air line hose for pneumatic tools. The rubber qualities recommended in this specification include 15-pound friction separation at a rate not exceeding one inch per minute.

Test pieces shall be cut longitudinally from the hose.

TUBE AND COVER. When stretched from two to nine inches the stress upon the tube shall be at least 900 pounds per square inch, and that upon the cover 800 pounds per square inch.

The set, or permanent elongation, shall not exceed 25 per cent.

The tensile strength shall not be less than 1,500 pounds per square inch for the tube, and 1,300 pounds per square inch for the cover.

Both tube and cover shall have an elongation at the breaking point of at least 2 to 10½ inches.

RUBBER FOR NEW YORK FIRE DEPARTMENT HOSE.

The quality and tests of rubber, required by the specifications of the City of New York for fire and street-cleaning hose, are shown in the following tabulation:

Contents and Characteristics.	A		B		C		D		E	
	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.
Vulcanized rubber gum by volume (per cent).....	75	...	75	...	70	...	55	...	55	...
Organic acetone extract (per cent by weight of vulcanized rubber gum present).....	...	8	...	8	...	5	...	15	...	15
Total sulphur in all forms (per cent by weight of vulcanized rubber gum present).....	...	4	...	4	...	8
Free sulphur (per cent by weight of vulcanized rubber gum present).....	3	...	5	...	4
Dry inorganic mineral fillers (not to contain carbon except as carbonates).....	Balance	Balance	Balance	Balance	Balance	Balance	Balance	Balance	Balance	Balance
Tensile strength (pounds per square inch).....	1,400	...	1,400	...	1,800	...	500	...	1,000	...
Reduction of tensile strength after being subjected to dry heat at 220 degrees F. for two hours (per cent).....	...	20	...	20	...	0	...	20	...	20
Tensile strength (pounds per linear inch in any seam).....	90 (a)	75 (b)
Elongation at breaking point (per cent).....	500	...	500	...	500	...	300	...	250	350
Reduction in elongation at breaking point after being subjected to dry heat at 220 degrees F. for two hours (per cent)...	...	20	...	(c)	...	15 (d)	...	25	...	30
Set (per cent of elongation at breaking point).....	...	10 (e)	...	6	...	6	...	10	...	8

(10) The addition of an alkaline solution of creosote to the latex before coagulation does not affect in any way the properties of the dry sheet rubber.

(11) The Wickham block and the Byrne blocked worm and thin crêpe did not show to any advantage, so far as the mechanical properties of the vulcanized product are concerned.

(12) Pressing the dry rubber into block, or rolling it up with or without tension, has very little effect on the time of cure or on the mechanical properties.

(13) There is no marked difference in time of cure or physical properties between the rubbers obtained by coagulating latex in two or three fractions.

(14) Rubber which is allowed to remain in a wet condition after coagulation (creosote having been added as a preservative) appears to be invariably quick curing, and to give very good mechanical results after vulcanization. Such rubber loses some protein on washing. In these cases the rapidity of cure appears to be related in some way to the moist condition of the rubber, and in some specimens the time of cure varies with the percentage of protein, the sample containing the lowest amount of protein curing in the shortest time. It is, however, impossible at present to connect these facts definitely, as a sample of rubber prepared by evaporating the latex in vacuo, which contained a very large amount of protein, also had a very short time of cure. Further work on this important point will be required, but if in the meantime a quick curing rubber with good mechanical properties is desired by manufacturers, it would appear that it could be obtained by pressing wet creosoted sheet into blocks of suitable size.

Vulcanized rubber gum by volume equals specific gravity times per cent by weight of rubber.

(a) Air hose tube only.

(b) Cotton rubber lined fire hose tube and rubber fire hose tube only.

(c) Rough bore suction, 30 per cent; general water hose, 20 per cent.

(d) Street cleaning hose, 20 per cent.

(e) Spray hose, six per cent.

The stocks indicated above are specified as follows:

A. Air hose tube and cover, and spray hose tube and cover.

B. General water hose (one and one-quarter inch and up) tube and cover, and rough bore suction cover.

C. Cotton rubber-lined fire hose tube; rubber fire hose tube and cover, and street cleaning hose tube and cover.

D. General water hose (one inch and under) tube and cover.

E. Coupling washers for fire hose.

Specifications for gasoline and steam hose do not indicate percentages of rubber or chemical tests. The requirements of rubber quality are limited to physical tests as follows:

GASOLINE HOSE. TUBE AND COVER. Tensile strength per square inch, 1,000 pounds, minimum. Elongation at breaking point 300 per cent, minimum. Reduction in tensile strength per square inch after submersion in 60-degree Baumé naphtha for a period of 48 hours and dried in air 24 hours, 20 per cent maximum. Reduction in elongation at breaking point after submersion, 30 per cent maximum. Non-volatile matter extractable in 60-degrees Baumé naphtha, one and one-half per cent maximum. Set (per cent of elongation at breaking point) six per cent maximum.

STEAM HOSE. TUBE AND COVER. Tensile strength per square inch before heating, 800 pounds minimum. Tensile strength per square inch after being subjected in the hose to 60 pounds steam

pressure per square inch for five days during eight hours each day, 600 pounds minimum. Elongation at breaking point before heating, 300 per cent. Elongation at breaking point after heating as above, 225 per cent minimum and 25 per cent maximum. Set (per cent of elongation at breaking point) 6 per cent maximum.

FRICTION TESTS.

Use	Test Pounds.	Width of Sample, Inches.	Separation, Min. Inches.	Length Separated, Inches.	Remarks.
Car tire rubber lined tire	12	1 1/2	1	10	Tube and inner jacket.

Water (street)	15	1	2	..	Cover and duck.

CHEMICAL PATENTS.

THE UNITED STATES

MANUFACTURE OF DIOLEFINS (ISOPRENE), CAOUTCHOUC, AND CAOUTCHOUC-LIKE SUBSTANCES. Improvement in the art of producing a diolefin and a caoutchouc-like body, consisting in adding fuming sulphuric acid to a mixture of an aliphatic ketone and an alcohol, both capable of yielding isoprene and caoutchouc and separating the products formed. [Hermann Stern, Munich, Bavaria, Germany. United States patent No. 1,218,332.]

ARTIFICIAL GUM. The process of making a condensation product suitable for reacting with formaldehyde to produce a gum, which consists in heating an impure phenol containing a cresol with an impure ketone in the presence of a condensing agent. [Wallace A. Beatty, New York City. United States patent No. 1,225,750.]

GERMAN PROCESS FOR SYNTHETIC RUBBER. This process has for its object the manufacture of isoprene, caoutchouc and caoutchouc-like substances by the reaction of fuming sulphuric acid on a ketone, simple or compound, or a mixture of ketones and an aliphatic oxide.

As an example of the process the following is noted:

To six kilograms of acetone contained in a vessel with a cooler, there is added gradually in small portions nine kilograms of fuming sulphuric acid containing 18 to 20 per cent of anhydride, in such manner that the temperature does not rise above 80 or 90 degrees C. In about one hour and a quarter all the sulphuric acid will have been added. The mixture, still hot, is placed in another vessel provided with a gas inlet and outlet pipe. About three kilograms of ethylene gas are passed through the mixture, which is heated to 100 to 110 degrees C. In two or three hours the reaction is complete and solid caoutchouc-like substances and liquid products are found. The liquids are distilled off and collected in a container cooled by a cooling mixture. The non-condensable gases escape by way of a pipe on this container. After neutralization of the acid mixture about five kilograms of raw caoutchouc and about one and one-half kilograms of isoprene and other volatile products are obtained.

Various experiments have shown that homologues and analogues, as well as mixtures of caoutchouc, are obtained when a simple ketone or a mixed ketone is heated alone or with fuming sulphuric acid. [Hermann Stern, Munich, Germany. United States patent No. 1,218,332.]

SOLID VEHICLE TIRE. A mixture of rubber, 34 parts; lithopone, 50 parts; sulphur, 6 parts; litharge, 2 parts, and oxide of iron, 2 parts. [A. Nixon. United States patent No. 1,221,083.]

THE UNITED KINGDOM.

INDIA RUBBER SUBSTITUTES. Made by treating, under the influence of light, mixtures of collagenous substances and hydroscopic substances, with or without fillers, with chromates, bichromates, or other oxidizing agents, the influence of light and the rate of oxidation being reduced by the addition of dyes, preferably in the presence of mineral oils, fats, etc. The mass is protected from the action of air and light until the final heating, which is continued at 80 degrees C., until all water is removed, air being passed through the mass during the process. Either aniline or mineral dyes are employed. The following is an example of proportions: Gelatine, 50 parts; glycerin, 65 parts; saccharose, 50 parts; kieselguhr, 20 parts; colcothar (red), 12 parts; zinc white and paraffin oil, each 5 parts; borax and potassium bichromate, each 1 part, and 5 drops of a 10 per cent solution of phenol. Rubber and sulphur may be added and the mixture vulcanized. [W. E. Reeser and A. Van Wille, Amsterdam, Holland. British patent No. 104874 (1917).]

INDIA RUBBER COMPOSITION. A rubber and sulphur mixture containing horse hair or bristles (three to four millimeters long) intended for use in the manufacture of tires, soles and heels, belting and packing rings. [C. Pacchetti, 28 Via Legnano, Milan, Italy. British patent No. 105,026 (1917).]

BALLOON FABRIC COMPOSITIONS. An impregnating and coating composition consists of pyroxylin dissolved in ether and alcohol, celluloid, Canada balsam, castor oil, and rubber. Aniline dyes soluble in spirit or oil, preferably those which tend to destroy the actinic powers of light, such as yellow or red dyes, and metallic pigments, such as aluminum, may be added. The composition may be used as a dope for balloon fabrics and many similar surfaces intended to be rendered water- or gas-proof. [L. C. Wooldridge, 231 Broadway, Cricklewood, and A. Fox, 19 Ramsey Road, West Hendon—both in London. British patent No. 105,137 (1917).]

CANADA.

TIRE PUNCTURE COMPOSITION. A preparation for sealing automobile tire punctures, consisting of water, two quarts; granulated cork, four ounces; powdered cork, two ounces; French chalk, one pound; white lead, eight ounces, and gum arabic, two ounces. [Ernest Campbell and Thomas F. Cashman, assignee of half interest—both of Calgary, Alberta, Canada. Canadian patent No. 175,134.]

RECLAIMING RUBBER. Method of reclaiming rubber from rubber waste or of improving natural crude rubber and reclaimed rubber generally, which comprises incorporating with the rubber a single ring phenol or its homologues under conditions which will produce the modifying results indicated. [Harold T. G. von der Linde, Plainfield, New Jersey. Canadian patent No. 175,240.]

RUBBER SUBSTITUTE. A composition made by heating together 360 parts by weight of gelatine, 75 parts by weight of glycerin and 35 parts by weight of chromic acid. [Peter B. Mellon, Ottawa, Ontario, assignee of Wolff Sudermann. New York City. Canadian patent No. 175,283.]

LABORATORY APPARATUS.

GOOCH CRUCIBLE HOLDER.

A NEW article in rubber is the piece of laboratory apparatus shown in the illustration. This Gooch crucible holder is unique in design. The rubber stopper or plug is lined with a bell-shaped glass funnel tube permitting hot acid solutions to be filtered without danger of contamination. The taper of the plug is designed to fit flasks of various sizes of neck. One complete holder displaces the usual carbon tube, rubber tubing and stopper. [Eberbach & Son Co., Ann Arbor, Michigan.]

A Method for the Valuation of Washed and Dried Rubber.

By Frederick Dannert, Ph.D., and Roscoe M. Gage.

[Dr. Dannert and R. M. Gage submit this as a method upon which they have spent much time and which has given satisfactory results. They do not claim that it is the only method and invite comment and criticism.—The Editor.]

PART I.—GENERAL.

IN the preparation of specifications for rubber goods, an extensive discussion has taken place concerning the use of such words as Para rubber, plantation rubber and *Hevea* rubber, because of the fact that it is impossible to distinguish these rubbers in the finished, vulcanized rubber goods. Some contend that it is more important that the product comply with certain physical or chemical tests. With this in mind, one of the authors has recommended the use of the phrase "pure fine Para rubber or its equivalent," so that it will be possible to use plantation rubber in those cases where experience shows that it is good. This in turn makes it necessary to define the term "equivalent," and after a careful consideration of all the elements involved the authors have adopted the following definition of this phrase:

"In specifications, a rubber shall be considered the equivalent of pure fine Para rubber, if, when tested in the following manner, according to a standard recipe, it will show a tensile strength at least equal to that of pure fine Para rubber."

(1) The standard recipe for compounding the Para rubber and the rubber which is to be compared with it shall contain the following ingredients:

Washed and dried rubber.....	50 per cent
Zinc oxide	37 per cent
Lead monoxide (litharge).....	10 per cent
Sulphur	3 per cent
	<hr/> 100 per cent

(2) The mineral powders shall not contain more than 0.5 per cent moisture and must be of such fineness that they can be washed through a 200-mesh sieve, leaving not more than 0.5 per cent of coarse particles. But all the particles must be fine enough to pass through a 100-mesh sieve.

(3) The rubber is to be broken down on a mixing mill, the mineral powders are to be added and the whole batch is to be mixed as quickly as possible.

(4) Each rubber compound is to be vulcanized in such a manner as to secure a maximum tensile strength, provided, however, that the test piece shall stretch from 2 to 14 inches without rupturing; the object being to provide a minimum elongation, so that the operator is enabled to vulcanize the specimen to the greatest possible strength under that condition.

(5) Method of testing. The tensile strength test is to be carried out on a Scott testing machine or a machine of similar type, power driven. The vulcanized test specimen at least six inches in length is scribed with bench marks two inches apart. The jaws of the testing machine are adjusted so that the maximum distance between them is four inches. The test specimen is placed in the jaws and the machine is operated so that the jaws separate at the rate of 20 inches per minute. No test will be considered unless the test specimen breaks between the bench marks.

(6) The stretch is carried out simultaneously with the tensile strength test. In order to fulfill the requirements of the official test, the bench marks must be at least 14 inches apart before the test specimen breaks.

(7) In order to obtain the record for the highest possible tensile strength, at least three samples of the rubber compound shall be vulcanized in each instance, and in case of dispute five samples shall be tested.

(8) Tensile strength shall in all cases be calculated from the cross sectional area of the original sample.

(9) The rubber compound shall be vulcanized in a steam press in the form of a sheet not greater than $\frac{1}{8}$ inch in thickness, and the test specimen shall be cut from this sheet by means of a die.

(10) The mineral powders used in the recipe are preferably dried in vacuum, at a temperature five degrees above the boiling point of water in vacuo. They shall contain not more than 0.5 per cent of moisture.

The authors are of the opinion that this method could be adapted to advantage for the valuation of washed and dried rubber for special conditions. For example, a compound might be prepared containing 40 per cent rubber, 47 per cent zinc oxide, and another might be prepared containing 30 per cent rubber, 57 per cent zinc oxide, the percentage of the other ingredients being so adjusted as to total 100 per cent.

It will be noted that this method has been so devised as to be of the most general applicability. No provision has therefore been made for determining such properties of the compound as: (1) aging test; (2) resistance to abrasion; (3) resistance to steam under pressure; (4) resistance to oil or volatile solvents; (5) dielectric properties; (6) resistance to dry heat; (7) flexibility at low temperatures.

It is now generally recognized that these tests can be carried out only on specific compounds which are prepared in the factory for certain rubber products. They are, in other words, "specific tests."

THE MINERAL POWDERS.

The fineness of the mineral powders used in the recipes is preferably determined by the following method, adapted from the standard cement test. Wire cloth for standard sieves for rubber pigments shall be woven (not twilled), from brass, bronze or other suitable wire, and mounted without distortion on frames, not less than 1.5 inches below the top of the frame. A circular sieve, 8 inches in diameter, is preferred. A standard 200-mesh sieve is one having nominally a 0.0029 inch opening and 200 wires per inch, standardized by the United States Bureau of Standards, and conforming to those requirements.

The test shall be made with 50 grams of the mineral powder. The sieve shall first be thoroughly cleaned. The mineral powder shall be placed on the 200-mesh sieve. The powder shall be well distributed over the sieve and shall then be gently sprayed with a jet of water such as would emanate from the water wash bottle commonly used by chemists. The sieve should be turned frequently. The operation should continue until not more than 0.05 gram passes through in one minute of continuous sieving. The fineness shall be determined from the weight of the residue on the sieve expressed as a percentage of the weight of the original material.

The percentage of the residue shall not exceed 0.5 per cent, but all particles must be fine enough to pass through a 100-mesh sieve.

PART II.—EXPERIMENTAL.

All the tests enumerated in this paper are based on batches of compound weighing 500 grams each. The time consumed for the several preliminary operations was:

	Minutes.
1. Weighing out one batch.....	10
2. Milling or mixing one batch.....	20
3. Allowance for resting after milling.....	45
4. Placing in the press, vulcanizing for 30 minutes and removing from the press: total.....	45
5. Allowance for resting after vulcanizing.....	210

6. Cutting out the test piece, scribing, gaging, testing for strength, calculating results: total for five test pieces cut from one slab..... 30

Total time consumed for entire test and report.... 360

NOTE 1. The optimum cure for this particular compound was found to be: 30 minutes at 50 pounds steam pressure (= 297 degrees F. = 147 degrees C.). All specimens were allowed to rest 210 minutes after vulcanization, before testing for strength, but it was found that specimens which had rested 24 hours after vulcanization showed a very slight increase in strength.

NOTE 2. The tests were carried out on Fine Para rubber, *Hevea* Ribbed Smoked Sheets, and *Hevea* First Latex Gristly crepe.

NOTE 3. The rubber compound was vulcanized in a steam press in the form of a sheet not greater than $\frac{1}{8}$ inch in thickness. The test specimen was cut from this sheet by means of a die, not less than 0.25 inch wide at the constricted part. (See "The Journal of Industrial and Engineering Chemistry," 1912, page 452).

NOTE 4. Batches weighing 500 grams each were prepared according to the following recipe:

	Per Cent.
Rubber	50
Zinc oxide	37
Litharge	10
Sulphur	3
Total	100

(A) With Fine Para Rubber:

Experiment No. 1. Vulcanize for 30 minutes at 50 pounds. Allow specimen to rest three hours after vulcanization. Tensile strength, 3,053 pounds; elongation, 2 to 14.4 inches.

Experiment No. 2. Vulcanize for 40 minutes at 50 pounds. Tensile strength, 2,928 pounds; elongation, 2 to 13.9 inches.

(B) With *Hevea* Ribbed Smoked Sheets:

Experiment No. 3. Vulcanize for 30 minutes at 50 pounds. Tensile strength, 3,167 pounds; elongation, 2 to 14.1 inches.

Experiment No. 4. Vulcanize for 40 minutes at 50 pounds. Tensile strength, 2,935 pounds; elongation, 2 to 13.6 inches.

(C) With *Hevea* First Latex Gristly Crêpe:

Experiment No. 5. Vulcanize for 30 minutes at 50 pounds. Tensile strength, 2,827 pounds; elongation, 2 to 14.0 inches.

Experiment No. 6. Vulcanize for 40 minutes at 50 pounds. Tensile strength, 2,533 pounds; elongation, 2 to 13.4 inches.

The "Factor of Elongation" is the term applied to the quotient obtained by dividing the original length into the ultimate length. If a specimen stretches from 2 to 14.4 inches, the factor of elongation is 7.2.

GULF SULPHUR OUTPUT INCREASING.

In order to meet the increasing demand for sulphur and its products, the output of the great mines in Texas and Louisiana is being greatly increased. The Freeport Chemical Co., Freeport, Texas, a subsidiary of the Stauffer Chemical Co., San Francisco, California, has placed in operation the first unit of a new plant for the manufacture of sulphuric acid and other products which, when completed, will represent an investment of about \$450,000. The mines are situated near the mouth of the Brazos River and it is proposed at a cost of \$455,000 to deepen the present 18-foot channel to 25 feet so as to accommodate larger vessels to meet the shipping demand.

Last year the United States used approximately 900,000 tons of sulphur, three times the annual consumption before the war. It is estimated that the 1917 demand will be 1,200,000 tons and that 1,600,000 tons will be the annual requirement if the war continues.

FALL MEETING OF THE RUBBER SECTION OF THE AMERICAN CHEMICAL SOCIETY.

[Dr. Tuttle's appeal to make the chemical symposium and program of papers at the forthcoming meeting even more practical and constructive than last year is so well stated and covers the ground so thoroughly that his announcement is published in full. During this great national crisis, when trade, commercial and professional conventions for the exchange of ideas regarding efficiency are far more necessary than in times of peace, all rubber chemists should make an extra effort to lend a full measure of cooperation.—Editor.]

THE Fall meeting of the American Chemical Society will be held in Boston during the week of September 10 to 16, 1917. The Rubber Section will hold its session at that time, and while the date has not been decided upon, it will probably be on Wednesday, Thursday, or Friday, September 12, 13 or 14.

I am particularly anxious to get the program arranged as soon as possible, so as to permit its wide distribution in plenty of time before the meeting so that members may easily arrange to be present. I wish, therefore, that all those who expect to present papers to the meeting will send me the titles at the earliest moment. We are going to try a new stunt this year: we want abstracts of all papers to be in the hands of the secretary at least a week before the meeting. These will be mimeographed, and placed in the hands of those present at the meeting. We expect this to stimulate discussion and bring out valuable and helpful criticisms. The success of the symposium of last year has encouraged us to repeat the idea again this year. The following subjects have been proposed:

1. Determination of total sulphur.
2. Determination of rubber.
3. Organic accelerators.
4. Crude rubber resources of the United States.

Those who care to prepare a short talk on one of these subjects, preferably covering their own experience, should so notify the secretary. This need not be a formal paper on the subject, but of course should be the result of careful study. We are also open to suggestions as to other topics which might be of interest.

At our meeting last year, there were present over one hundred members and guests. A glance at the proceedings as reported in THE INDIA RUBBER WORLD in October, November and December, 1916, will give you some idea of the value of the meeting. Whether or not this year's meeting will prove equally profitable will depend largely upon the support which the meeting will receive from the rubber chemists. No better opportunity than this is offered to meet your fellow chemists from all over the country and discuss such problems as do not involve trade secrets, the solution of which would be of considerable value in your laboratory. This phase of the Rubber Section's activities would in itself justify its existence.

Some time during the next two weeks I wish every member of the Section would take time to write me a letter giving at least one suggestion as to how to run this next meeting. I know that if some of the suggestions given to me after the meeting last year had been received a few weeks earlier, we would have had a better meeting.

All those who were not present at the last meeting, and who are interested in receiving advance notices of the program, etc., should send their names in at once, so that they may be placed on the mailing list.

The following will be of interest as showing the geographical distribution of those who registered at the 1916 meeting. In addition, there were about 15 or 20 who failed to register. New York City 22, New York State 9, Massachusetts 16, New Jersey 15, Pennsylvania 12, Ohio 11, Rhode Island 3, Connecticut 4, Western States and Canada 10.

JOHN B. TUTTLE, Secretary.

Address: Bureau of Standards, Washington, D. C.

OAKITE, A NEW CLEANSER.

OAKITE is a non-explosive white powder soluble in water and intended to replace naphtha, potash or soap in cleaning rubber goods and molds.

A solution consisting of one ounce to a gallon of water is a good recipe for molded goods. Inner tubes may be cleaned by soaking in a similar solution at a temperature of 100 degrees F.

A solution of two ounces to a gallon of warm water is recommended for removing the bloom from sheet rubber. Power brushes and rubber mats may be cleaned with a solution of this strength. Grease and dirt are also removed from rubber soles by applying it with a rag or sponge. In making footwear, the lasts or trees are cleaned before being used and the finished boot after being built up.

A solution of four ounces to the gallon of water and applied with a wire brush is suitable for cleaning molds. Bicycle tires may be soaked in it to remove the bloom, and casings may be washed with it after using emery cloth on the bad spots, care being taken not to wet the inside of the casing.

The bloom is removed from hot water bottles by putting them in a washing machine containing six ounces to the gallon of water, the water then being heated to the boiling point for 20 minutes.

A turning compound used in manufacturing round hard rubber articles consists of one ounce of Oakite and one quart of kerosene to a gallon of water.

Oakite does not blister nor discolor rubber goods or fabrics, nor affect the cement in any way. It throws off no fumes, will not injure the hands of operators and is inexpensive, costing only 12½ cents per pound.

THIRD NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

The Third National Exposition of Chemical Industries is to be held at the Grand Central Palace, New York City, during the week of September 24, this year. Preparations are in active progress, with an advisory committee composed of Chas. H. Herty, chairman; Raymond F. Bacon, L. H. Baekeland, Henry B. Faber, Colin G. Fink, Bernhard C. Hesse, A. D. Little, R. P. Perry, Wm. Cooper Procter, E. F. Roeber, G. W. Thompson, T. B. Wagner, Utley Wedge and M. C. Whitaker. The managers, Charles F. Roth, Adriaan Nagelvoort, and F. W. Payne, report that the exposition will this year be larger and more interesting than its predecessors, and that manufacturers of rubber goods, textiles and industrial chemicals will be well represented. At the close of the last exposition much of the space available on two floors then used was re-engaged by exhibitors for this coming exposition. The present time sees these floors completely taken and the greater part of the available space on the third floor engaged.

A great section of exhibits showing the industrial opportunities our South presents in its raw materials will be known as the "Southern Opportunity Section," and a "Paper and Pulp Industry Section" has been provided. Many exhibits will be of interest to men from the rubber and textile industries. Many of the chemical and allied industry companies, notably dyestuffs companies, have so expanded their operations in the past year, and their products and interests have become so numerous that they require much additional space to make adequate showings.

The Bureau of Commercial Economics at Washington is this year again preparing many of the motion picture films that will be shown, and many exhibitors have now in preparation pictures showing phases in their work in the manufacture of their products. These will be of absorbing interest, having been photographed for the first time.

The program of speakers has not yet been announced, but we are informed that it will be composed of many of the nation's foremost men, and men who have come to the fore in the nation's hour of need.

INCREASING DEMAND FOR ASBESTOS.

The United States is one of the largest manufacturers of asbestos goods, but is not a large producer of crude asbestos. The supply of all grades in Quebec, Canada, is so large, so conveniently obtained, and the quality is so excellent, as to delay the development of asbestos deposits in the United States. The demand for high-grade asbestos has always been active, but recently, under the stimulus of war conditions, it has become still greater, and the available supply, although larger than before, is frequently not equal to the demand. In 1916 the total output of asbestos in the United States was 1,479 short tons. The imports during the same time, almost wholly from Canada, amounted to 116,162 short tons, making a total supply available for manufacture in the United States of 117,641 tons.

The prices for asbestos produced in the United States during 1916 are said to have ranged, according to grade, from \$15 to \$1,000 a ton. In 1915 normal prices ranged from \$10 to \$400 a ton. [United States Bulletin, 666-H.]

THE PRODUCTION OF TALC AND SOAPSTONE.

The total domestic production of talc is nearly 12 times the total imports, over one-third of which came from Canada. The talc of New York State is an especially good paper filler and is largely used for that purpose, although much goes into paints. The output of Vermont is used for the same purpose and also for foundry facing, rubber goods, and coating walls. A small amount is used for crayons. Talc for pencils, crayons, burners, and insulators comes almost wholly from North Carolina and Georgia and is cut in Chattanooga. The demand for talc of the highest grade is greater than the supply. Much of the material for toilet powders is imported. With the exception of compact material for pencils, burners, and insulators and the best grade for toilet powders the United States has a large reserve in nearly all the producing States. It is believed that by more searching field investigations the domestic output even of pencil and gas-burner talc as well as the best toilet powder grades may be greatly increased.

In 1916 there was a small production of soapstone in California, but almost the entire output of the United States came from Virginia, where there were four producing quarries. The total yield, including that of California, was 19,652 short tons. The United States has large reserves of soapstone and can, if necessary, greatly increase its output. [United States Bulletin 666-I.]

ANILINE CONCERNS CONSOLIDATED.

The National Aniline & Chemical Co., Inc., which was recently chartered at Albany, New York, is an amalgamation of several well-known concerns in the aniline industry, namely, of the firms of the Schoellkopf Aniline and Chemical Works, Inc., the W. Beckers Aniline and Chemical Works, Inc., the National Aniline and Chemical Co., the Benzol Products Co., The Barrett Co. and the Semet-Solvay Co.

The company is capitalized at \$2,000,000, being 200,000 shares at a par value of \$100 and 350,000 shares in common stock without par value. The stocks, however, have been taken by the firms concerned, in exchange for their properties. The company has plants at Buffalo, Brooklyn, and Wappingers Falls, New York, and at Easton, Marcus Hook, and Frankford, Pennsylvania. The organization proposes to cover the aniline industry from the raw materials to the finished products. The New York City office is at 244 Madison avenue.

RUBBER-LIKE PRODUCT.

This invention is a condensation product of acetone or its homologues, formaldehyde or its isomers, and phenol or its homologues. [W. A. Betchy. Japanese patent No. 30,049 (September 16, 1916).]

New Machines and Appliances.

THE ALLIS CHALMERS STEAM TURBINE AND ALTERNATOR UNIT.

The widest application of the steam turbine is without doubt in turbo-generators for electric drive. The use of electric power in rubber mills has increased proportionately with the steady growth of the industry that ranks among the foremost consumers of electric energy. In all sizes of units above 200 kilowatts, the first cost, reliability and ease of operation place the steam turbine in the van of all prime movers. The large sized units that are now necessary in the principal rubber mills of this country are made possible by the steam turbine that is

establishing records of economical operation heretofore thought impossible. Rubber manufacturers have been prompt in recognizing the advantages of electrical power and all of the larger plants and many of the smaller ones are equipped with electrical drives.

A recent installation in the plant of the Federal Rubber Manufacturing Co., Cudahy, Wisconsin, is here shown. It consists of a 3200-kilowatt high pressure condensing steam turbine and alternator unit of the standard Parsons type and will be used for generating alternating current for general use in the rubber mill. The characteristics of the electrical end are 60 cycle, 3 phase, 2300-volt, 80 per cent power factor. The steam end takes high pressure steam direct from boilers and exhausts into a high vacuum condenser. [The Allis-Chalmers Manufacturing Co., Milwaukee, Wisconsin.]

LINEAL MEASURE PRODUCTIMETER

In the manufacture of rubber goods an accurate record of the product of each machine is essential in computing the cost of manufactured articles. A measuring device that is particularly serviceable in recording the number of lineal feet produced by tubing machines is shown in the illustration. An adjustable bracket affords easy attachment to the front of the machine so that the measuring wheel rests lightly on the stock as it emerges from

the head. The figures record actual feet, although the measuring wheel is 16 inches in circumference, which has been found the most practical size for all kinds of work. A leather-faced brake prevents the wheel from spinning when the end of the

stock is reached. Dirt-proof oil cups are provided and the working parts enclosed in a dust-proof case that may be locked to prevent it being tampered with. The counter weighs 15 pounds and is made in three sizes, the smallest counting up to 999, the medium size counting up to 9,999, and the largest will count 999,999. [Durant Manufacturing Co., Milwaukee, Wisconsin.]

STOCK CUTTING MACHINES.

Machines for cutting tubing machine stock are used in every mill where molded rubber goods are made and are therefore not particularly novel. However, the machine here shown, while

suitable for a variety of work, is specially designed for cutting rubber heel stock. The machine is bolted to a hollow pedestal of substantial design that supports the bracket in which is journaled the cutter shaft driven by a two-step cone pulley. This shaft is provided with a fly wheel on the outer end, and the cutting

knife is mounted on the inner end in shearing clearance with the stock head. This head is adapted to hold the different bushings necessary in cutting stocks of various shapes and diameters and an adjustable stop is provided that regulates the length of stock to be cut.

This machine precludes the usual method of slabbing and dieing-out heel stock and, moreover, it may be used to cut stock for smaller articles, such as basin-plugs, fuller-balls, bumpers and many other forms of molded rubber goods. [Holmes Brothers, 500 South Peoria street, Chicago, Illinois.]

THE AUTOCALL SIGNAL SYSTEM.

Electrically operated signals for locating and calling to the telephone or the office, heads of departments who are employed somewhere in the factory have been in use for some time in the larger rubber mills. The advantages of the system are obvious and in the larger manufacturing establishments it is considered indispensable. As a natural result the system has been improved and its scope enlarged so that the Autocall system is now a recognized aid in modern rubber mills.

The Autocall central is a small, compact device that is placed within reach of the telephone operator. Where space is limited the central may be located in any convenient place and connected by cable with a plug board placed so that it is accessible to one or more operators.

The Autocall central and the remote call are both operated by a plug board similar to a telephone switchboard, with which all operators are familiar. To locate anyone, the operator inserts the plug in the hole corresponding to that person's signal, and by giving the motor a quarter turn the call is sounded at all

signal stations simultaneously any desired number of times at brief intervals. As the signals are being transmitted a colored prism pilot light in the central station cabinet indicates to the operator that the system is in operation.

Signal stations are located in the various departments of the mill and the signals are adapted to be heard under the varying noise conditions. Under ordinary conditions a gong is used.

while in offices and laboratories the autotone signal is preferred. When extreme noise precludes a bell, steam or air whistles are substituted, and when air or steam is not available electric horns may be used.

One of the optional features of the service is the automatic ringing of a special signal, distinctive from the call signals, for starting and stopping work, while another feature provides means for summoning the watchman to the gate when the factory is closed. [The Autocall Co., Shelby, Ohio.]

CEMENT TUBE FILLING AND CLOSING MACHINE.

When it is considered that the tool box of almost every motor car, motorcycle and bicycle contains a tube of rubber cement for emergency purposes, it is not difficult to estimate that millions of these little accessories are produced annually. The tubes are filled with cement at the large end which must be closed and sealed with a special metal clip to prevent leakage. The filling and closing operation is automatically performed on the machine here illustrated, which is used by many of the leading cement manufacturers. As will be seen, the machine is mounted on a substantial bed-plate supported by suitable legs, and is driven by belt power or motor drive, if desired, only $\frac{1}{4}$ horse power being required.

The container is designed to carry sufficient air pressure to facilitate the flow of the rubber cement. This air pressure may be taken from any source available, but must not exceed 20 pounds per square inch at the receiver on the machine. Any pressure less than this may be used, depending

on the viscosity of the material which is being handled.

The machine will handle tubes ranging from $\frac{1}{2}$ to $1\frac{1}{4}$ inches in diameter and from 2 to 6 inches in length and has a capacity of 25 to 30 tubes per minute. It occupies a floor space of 30 by 30 inches and weighs 405 pounds. [Arthur Colton Co., Detroit, Michigan.]

STAMPED METAL RUBBER MOLDS.

The time-worn method of making cast iron or steel molds adapted to the manufacture of hot-water bottles, bulbs and hollow toys is a matter of considerable expense, particularly when large quantities of goods are produced. While the following process is admittedly tentative and limited in application, the idea is practical and of sufficient suggestive value to make it interesting.

Stamping or drawing plates of soft steel forming a multiplicity of forms by means of dies and hydraulic pressure is a highly specialized branch of mechanical art. The steel maker is called upon to provide special sheet material of different gages, possessing the proper strength and ductility for the cold stamping process. All manner of forms with embossed and engraved surfaces are accurately reproduced in sheet metal by specially constructed dies in a hydraulic press.

For example, the first steps in making stamped hot-water bottle molds would be to construct the dies. This operation will, of course, be costly, but a thousand or more molds may be formed in the press with these dies at a ridiculously small

cost when compared to that of making the same number of cast iron or steel molds. Two pairs of dies, called a die and force, are made, consisting of a male and female die for each half of the mold. Soft steel blanks are forged or otherwise rough-shaped by machining, and by milling and hand cutting, two pairs of dies comprising a die and force are made in exact reproduction of each half of the water-bottle and provided with dowel projections and depressions for alining the mold parts. The dies

are then case-hardened and fitted to the die press.

The mold parts are stamped separately from sheets of steel from 1-16 to $\frac{1}{8}$ inch thick, depending on the character of the mold to be made. The outfit recommended for this work consists of a 600-ton hydraulic press connected to a motor-driven four-plunger pump. The press is of the four-column type.

working at a pressure of 6,000 tons per square inch. The ram has a six-inch stroke and the platens measure 23 by 24 inches, operation of the press being controlled by a hand lever.

After the stamping operation the upper and lower parts of each mold are assembled and require very little fitting, spring

steel clamps being provided for holding the two sections together. The part remaining to complete the mold is a solid metal funnel core provided with an air valve for inflating the water bottle during vulcanization.

In making bottles the blanks are cut from the sheeted stock and placed in the mold as usual. The clamps are sprung over the edges, holding the mold sections firmly together. Molds by the thousands may be then hung in a heater, inflated and cured in open steam.

Should this method prove successful in the manufacture of certain rubber goods the expense of mold equipment and factory costs would thereby be greatly reduced. [Schoder & Lombard Stamp & Die Co., Inc., 251-253 Canal street, New York City.]

THE LANGER TIRE FABRIC AND LOOM.

Inventive effort to eliminate friction between the plies of fabric used in ordinary pneumatic tire construction is now being directed toward reducing the number of fabric plies in the carcass; moreover, it has been found impractical to wind heavy fabric on a core.

A specially woven fabric that may be used in one or two ply fabric construction, and the loom on which it is made, are shown in the accompanying illustrations. The fabric is woven in continuous tubular forms, each possessing the correct shape and diametrical measurement of the intended tire carcass. These sections are cut off, impregnated or frictioned with the rubber and made up on a collapsible core in the usual way.

The loom is of regular construction with the exception of the fan-shaped reed which is automatically raised and lowered during the weaving operation. When the wide part of the reed beats in the weft the fabric is correspondingly wide and when the

narrow part is in position to beat in the weft the product is narrow, thus forming the corrugated contour of the tubular fabric. [Henry Langer, Middletown, Connecticut.]

THE MERCURY TRACTOR.

It is now quite common in a modern rubber mill to see electrically-driven industrial trucks and trailers carrying iron molds and cores, raw materials, finished and partly finished products from one department to another with ease and rapidity. The industrial haulage problem has, of recent years, become more important as factory additions are being made and floor space multiplied. The surrounding conditions and requirements vary

greatly in different mills, so that a type of power unit that will give satisfactory service under a variety of conditions is desirable.

The three-wheel tractor here illustrated has a small turning radius and is generally adaptable to rubber mill requirements. The power is obtained from storage batteries that are compactly grouped within the covered body of the car. The heavy duty motor is mounted directly on the axle and a mercury type controller with automatic safety return is provided. Three speeds are available, one forward and two reverse. No resistance is used. The steering lever is directly connected to the front

wheel, which is only permitted to turn in the angle of the minimum turning radius of the car. The foot pedal is connected to the brake wheels on the rear axle for ordinary service. Mercury safety and emergency brakes are attached to the driving shaft. This brake is set at all times excepting when the driver is seated, and instantly stops the car when he arises from the seat. In the illustration the tractor is shown hauling a trailer loaded with iron tire cores. [Mercury Manufacturing Co., 4118 S. Halstead street, Chicago, Illinois.]

MACHINERY PATENTS.

THE BANBURY AUTOMATIC ENCLOSED MIXER.

A MIXING machine of the enclosed type for automatically mixing and dumping the charge of massed rubber is here described. A front elevation and a vertical sectional view are shown

in the illustration, in which *A* and *B* are cylinders that open into the chamber *C*. The two rotors *D* and *E* are provided with blades whose peripheral edges are adjacent to the walls of the cylinders. Supported by the housing *F* is the cylinder *G* in which operates a

piston head connected by means of a rod to the weight *H*, that reciprocates in the chamber *C*.

The upper face of the discharging door *I* forms part of the mixing chambers and is hinged on the shaft *J* and provided with a counterweight. The door is locked in place by two rollers mounted on yokes fixed to the shaft *K* that engage the door lugs. The cylinders, bottom door and mixing blades are hollow so that they may be water-cooled. In mixing rubber materials a certain number of revolutions is required and as this varies with

different materials a device is provided that rings a bell when the predetermined number of revolutions has been completed.

In commencing operations, the door being closed and the weight raised, the material is placed in the machine, the weight lowered and the rotors started. After a predetermined number of revolutions, air or water is automatically admitted to the upper cylinder, the weight is raised and dry ingredients are fed into the machine. At the end of this period the weight is automatically lowered and bears on the material during the mixing operation. When this is completed the mechanism controlling the door-locking device is operated, the door released and, swinging downward, discharges the contents of the cylinders. [Fernley H. Banbury, Ansonia, assignor to Birmingham Iron Foundry, Derby—both in Connecticut. United States patent No. 1,227,522.]

ANCHORAGE FOR CORDS OF CORD TIRES.

This invention relates to the true cord tire in which the parallel cords comprising the carcass are laid over the core at an angle and anchored at the beads.

less wire coils *F, F'*, having one-half the number of convolutions as there are pins on each side of the core, are located just within the pins by any temporary means.

When the coils of wire have been fixed in position, one end of the cord is anchored in any suitable way and the cord is first doubled upon itself and the bight slipped over one of the convolutions of the wire. The cord is again looped or doubled upon itself and the bight placed over a convolution of the opposite wire coil. When the cord is pulled tightly about the core the bights will be slightly separated and drawn upward on the inside of the coils.

When the inner layer of cords has been placed in position on the core, the last run will come into position near the first end which was temporarily anchored in position. The two ends may then be tied together, or the same cord continued without cutting so that the second layer of cords is formed in a manner similar to the first except that the angle of the cords is opposite to that of the first layer. [Benjamin L. Stowe, Jersey City, New Jersey, assignor to Morgan & Wright, Detroit, Michigan, United States Patent No. 1,228,144.]

RUBBER FOOTWEAR ROLLING MACHINE.

This machine is primarily designed to apply air pressure to rubber footwear while on the lasts and prior to vulcanization. The illustration is a side elevation of the machine that comprises two tandem air cylinders *A* and *B*, the inner ends being open and spaced apart, while the outer ends are closed.

A head *C* connected to pistons operating in hydraulic cylinders *D* and *E*, reciprocates between the open ends of the tandem cylinders. A hollow bar or last carrier *F*, provided with nipples for supporting the lasts, projects from the outer face of the head. Two arms loosely mounted on the last carrier, support on their outer ends a shaft *G*, on which are arranged a number of presser arms *H*, that press the lasts on the

carrier bars, thereby insuring an air-tight joint. From the inner face of the reciprocating head a last carrier identical to the one just described projects in an opposite direction; however, this is not shown in the illustration. The four-way hydraulic valve controlling the reciprocal movement of the head and the three-way valve controlling air pressure in the cylinders are operated by a cam movement shown at *I*, that is, transmitted to the valve stems by chain gearing.

The shoes on the perforated lasts are placed on the carrier bar, being held in place by the presser arms and the clutch mechanism started that operates the hydraulic valve. The head then moves to the right, entering the shoe carrier in the right hand air cylinder and hermetically closing it at the same time. Air is then automatically admitted to the cylinder, thereby applying pressure to the shoes on the lasts. Entrapped air escapes through the lasts and the hollow carrier bar to the atmosphere. When the machine is reversed the air is automatically released from the right cylinder and the hydraulic pistons move the head to the left, entering the left shoe carrier in the corresponding air cylinder when pressure is applied to the shoes. [Alfred A. Glidden, Watertown; Edgar P. Dorman, Boston; George L. Finch, Brighton, assignors to Hood Rubber Co., Watertown—all in Massachusetts. United States patent No. 1,228,904.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- 1,225,779. Apparatus for treating rubber articles. J. T. Crowley, assignor to The Beacon Falls Rubber Shoe Co.—both of Beacon Falls, Conn.
- 1,225,845. Tire repair vulcanizer. F. M. Naysmith, T. J. Gillaspay and F. D. Carl—all of Davenport, Iowa, assignors of one-half to said T. J. Gillaspay and one-half to A. D. Brownlie—both of Davenport, Iowa.

New Goods and Specialties.

RUBBER FUSE COVER.

STILL cases are loaded in rooms maintained at a temperature of approximately 80 degrees F., and it is of the utmost importance that the exploding charge be kept "bone dry" until the shell is placed in the gun. The covers ordinarily used

for these uses to keep moisture from affecting the exploding charge while being carried from point to point have been made of copper, but the recent adaptation of rubber as material for the covers has proved thoroughly satisfactory, and large shipments of these shells, kept in perfect condition by a rubber cover such as is shown herewith, are now sent across the Atlantic to the firing line. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

DIVING CAP WITH SPONGE RUBBER RING.

The newest idea in bathing caps intended for actual diving and swimming, shown in the accompanying illustration, has a

patented waterproof headband with a sponge rubber ring. The roll edge conforms to the shape of the head, fitting tightly over the hair and ears and keeping them thoroughly dry and comfortable. This cap is made of pure gum in the natural color only, and in three head sizes. In order to permit the sponge rubber ring being rolled or adjusted to any desired position on the head the cap is made deeper than

ordinary bathing caps. The Faultless Rubber Co., Ashland, Ohio.]

ROUND ELASTIC GARTER WITH CLASPS.

A novelty in women's round garters clasps around the leg, thus avoiding the uncomfortable necessity of stooping over to put them on. A device is also afforded for making the garter larger or smaller and the clasps contain no metal or other corrosive material. The elastic band is of silk cable web or mercerized silk cable web, three-quarters of an inch wide, in white, sky, lilac or pink, ornamented with handsome ribbon bows. [Ivory Garter Co., 601-611 Baronne street, New Orleans, Louisiana.]

RUBBERIZED FLAGS.

The American flag flanked by the French and the British and attached to the front of automobiles is a popular expression of patriotism and allied sympathies which has recently been made more enduring by the use of rubberized silk in their manufacture. This renders them impervious to the effects of damp or rainy weather. The three flags are upheld by metal rods, brass-tipped, and a metal clamp secures them to the radiator of the car. [E. J. Willis Co., 85 Chambers street, New York City.]

DRIDEK AUTOMOBILE TOPPING.

DrideK Rubber and DrideK Leather are the trade-names for a new rubberized fabric for automobile tops. It is a three-ply composition material, very soft, pliable and easy to work. It is

claimed to be absolutely waterproof and to afford unexcelled service under all conditions. Samples of DrideK rubber and leather are shown in the above illustration. [L. J. Mutty Co., 175 Congress street, Boston, Massachusetts.]

SANITARY DENTAL CHIP BLOWER.

The old style chip blower used by dentists was a dangerous instrument, since it made possible the transmission of bacteria from one mouth to another by the entrance and ejection of air

through the nozzle. In the new type of blower shown herewith, the air does not enter through the nozzle, a special valve being provided next to the rubber bulb and a double-acting valve in the tube, so that germ-bearing matter cannot be drawn in. Red or slate-colored rubber is used for the bulbs. [Yoder Manufacturing Co., 528 Penn Square, Reading, Pennsylvania.]

THE TWIN BED OUTING TRAILER.

A complete camp on wheels affording weatherproof shelter for six people is shown herewith. Considering its capacity, this trailer is light and easy to haul, weighing only 571 pounds with all equipment. It has two wheels equipped with pneumatic or solid rubber tires, and the side curtains are made of heavy rubberized drill. A patented canopy top-raising device operates on the same principle as a car window, the tent, which is at-

tached to the inner edges of the top, automatically dropping into place. Three shelves attached to the roof also drop into place when the canopy is raised. The beds slide readily into position and are easily adjusted to the corner poles. A patented ice-box is carried at the rear, under the end, and an unusual amount of storage room is afforded. The body of the trailer when folded for transportation is less than 7 feet long, 4 feet wide and 12 inches deep.

As all parts are made sufficiently strong for heavy usage, it is only necessary to remove the tent and beds to provide a practical commercial trailer. [Sorlien Ceiling Bed Co., 406-16 Sixth avenue, South, Minneapolis, Minnesota.]

THE RED SPOT SEARCHLIGHT.

Among many advantageous features this lighting apparatus contains a rubber gasket between the glass and the bezel of the spotlight which effectually prevents the entrance of any particles of dust or moisture. The "Red Spot" is a powerful searchlight for use on motor cars or on boats, in making landings or navigating dark and unfamiliar channels. A very simple and practical double swivel bracket mounts the spotlight and six feet of double conductor, flexible cord, weatherproofed and having copper terminals for attaching to the battery or lighting system, is supplied. A special feature is the arrangement by which the spotlight may be instantly changed to a glaring red danger signal. An adjustable mirror is mounted on the body of the light. [The F. W. Wakefield Brass Co., Vermilion, Ohio.]

**CANVAS SHOE CLEANING ERASER.**

Rubber has for some time been recognized as a serviceable cleaning agent for white canvas shoes. Now a manufacturer of shoe dressings and rubber cements has placed on the market an eraser of white rubber specially designed for this purpose, of a compound to give high efficiency in erasing. It is about three inches long by one inch wide and one inch thick, an ade-

quate size and also convenient to hold in the hand. [Boston Blacking Co., East Cambridge, Massachusetts.]

A SEASONABLE SANDAL.

A neat sandal for children's wear is of tan duck with red rubber sole and foxing. The ankle strap passes through a loop in the instep strap and buttons over the ankle bone. A large opening over the toe joints and a low cut at the quarters insures coolness. The insole and counter are of leather. Further ornamentation is secured by cross stitch finish all around the edges. The same shoe is made of white duck, with white sole and foxing. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

**IMPROVED "ANTI-FLINCH" RECOIL PAD.**

The latest improvement in recoil pads, shown herewith, comprises a cushion of soft red molded rubber, vulcanized to a hard rubber base plate. Through the soft cushion there are oblong slanting holes, which slant at an angle of 45 degrees in line with the gunstock. When the gun is discharged and pressure is brought to bear on the pad, the walls of rubber fold or lap on each other and spring back in their normal position when the pressure is relieved. This patented feature takes up the recoil and eliminates the upward whip of the muzzle of the gun, and is of great assistance when shooting "doubles" at the traps and where rapid firing is necessary. [Jostam Manufacturing Co., 1038 Montana street, Chicago, Illinois.]

**"VERIBEST" FORCE PUMP AND SINK STOPPER.**

A molded circular piece of red rubber about five and one-half inches in diameter, with a small metal ring securely held in the center, forms a handy accessory that is claimed to be very efficient not only as a stopper for the sink, thus dispensing with the dishpan, but as a force pump to clear clogged drains. Suction power is obtained by means of a groove one-half inch wide around the edge of the under side. [Veribest Sales Co., 421 Pine street, San Francisco, California.]

**LEWIS DOUBLE BALL-BEARING INK WELL.**

The double ball-bearing feature in this ink well consists of a small corked float ball which rests upon a larger double-corked float enclosed in a cylinder of rubber with a removable top and circular opening. The ball rolls within its rubber casing, protecting the entering pen point by its lack of rigidity. The ink is forced to the top whenever the pen is dipped, supplying sufficient fluid so that no unnecessary time and effort are wasted in repeated dipping, and the construction is such that the top ball will not recede from the opening until the inkwell needs refilling. The square-shaped substantial glass frame has a removable top with an elastic band which clings and holds it in place. [W. E. Lewis, Corry, Pennsylvania.]

The Editor's Book Table.

EVAPORATING, CONDENSING AND COOLING APPARATUS. BY E. Hausbrand. Translated from the second, revised German edition by A. C. Wright, M.A., B.Sc. Second English Edition. Revised. Scott, Greenwood & Son, London, 1916. American distributors, D. Van Nostrand Co., New York City. [8 vo, 401 pages, 21 illustrations, 76 tables. Price, cloth, \$5 net.]

THIS authoritative work by the chief engineer of C. Heckmann, Berlin, and author of "Drying by Means of Air and Steam," is of exceptional value to engineers because of its table of coefficients giving positive answers to all questions ordinarily arising. Certain arithmetical and printer's errors of the former edition have been corrected and conversion diagrams have been appended by means of which the quantities in metric units may be readily converted into British units.

The treatise takes up transmission of heat, apparatus for heating with direct fire, injection of saturated steam, superheated steam, evaporation by hot liquids, transference of heat in general, evaporation in vacuum, evaporators of different types, diameter of pipes for steam, alcohol vapor, air and water, losses of heat by radiation, condensers, heating and cooling of liquids, air pumps, etc.

CHEMICAL DISCOVERY AND INVENTION IN THE TWENTIETH century. By Sir William A. Tilden, F.R.S., D.Sc., LL.D., Sc.D. George Routledge & Sons, Limited, London. E. P. Dutton & Co., New York City. [8vo, 487 pages, 150 illustrations, 11 portraits. Price, cloth, \$3.50 net.]

In this volume one of the most distinguished chemists of Great Britain and professor emeritus of chemistry in the Imperial College of Science and Technology, presents a thrilling account of the momentous conquests of matter by human knowledge during the past quarter century. The work is divided into four parts, the first being devoted to laboratories and laboratory apparatus for general teaching and special purposes. The second part deals with modern discoveries and theories, such as the disintegration and transmutation of elements, electrolysis, catalysis, architecture of molecules, etc. The third part treats modern applications of chemistry, including water and its purification, petrol, coal tar, dyes, essential oils, vegetable fiber and products from cellulose, explosives, fixation of atmospheric nitrogen, and rubber. The fourth part takes up progress in organic chemistry, particularly sugar, proteins, natural colors and enzymes.

The chapter on rubber reviews the principal sorts and sources with statistical production and trade data in quantity and value, both wild and cultivated. Plantation practice is sketched briefly; also the composition and constitution of rubber, rubber substitutes, the process of vulcanization, reclaiming, and concludes with a history of synthetic rubber. It is pointed out that the by-product, acetone, may become so profitable as to reduce the cost of butadiene rubber considerably, and so assist the synthetic in competition with the natural rubber. However, it is stated that the many difficulties yet to be overcome are such that rubber planters need entertain no alarm, particularly in view of the many new uses to which increased production might be put, especially if obtainable at reduced cost.

THE WORLD'S COTTON CROPS. BY JOHN A. TODD, B.L. A. & C. Black, Limited, London, England. The Macmillan Co., New York City. [8vo, cloth, 460 pages. Price \$4.25.]

At the present time, when the cotton trade stands in a critical condition as regards its raw material, and when so much pioneer development work is being done in connection with cotton growing, this volume will be especially welcome. It gives an account of the sources and varieties of raw cotton in non-technical language for the average grower and consumer, telling the former of the final destination and use of his crop and his rivals in other countries, and informing the latter of the conditions under which his raw material is produced and how to estimate future pros-

pects and determine the possibilities of new sources of supply. The author spent five years in Egypt and visited practically the whole of the American cotton belt and was born and brought up in close touch with the west of Scotland cotton industry, so that he has had exceptional opportunities to study his subject. Aside from general chapters on the cotton plant, geographical distribution of cotton, the uses of cotton and cottonseed, and the effects of the war, special chapters are devoted to the different cotton producing countries, including India, China, Japan and Indo-China; United States, Mexico, etc.; the price of American cotton; British West Africa; British East and Southeast Africa; other African colonies; South America; hand-staple American Upland; Egypt; Anglo-Egyptian Soudan; Sea Island cotton; Oceania, etc. Many excellent half-tones, maps, diagrams and a statistical appendix illustrate and supplement the text.

The disproportionate space allotted to Egypt is fully justified on the ground that Egypt is the world's chief example of cotton growing under irrigation, which, in the writer's opinion, is showing a tendency to become the prevailing method of cotton growing, which is now responsible for at least half of the world's crops, other than American, in Egypt, India, Russia, many parts of Africa, Peru, Arizona and California.

THE LAW APPLIED TO MOTOR VEHICLES. BY CHARLES J. BABBITT. Second Edition by Arthur W. Blakemore, West Publishing Co., St. Paul, Minnesota. [Large 8vo, 1,262 pages, buckram binding. Price, \$7.50.]

The universality of motor vehicles, for pleasure or business, makes the questions of law regarding them, the rights and privileges of their owners, their liability in cases of accident, and the many knotty legal points which have been decided upon matters of special interest. This volume, bound in the modern law library style, contains, under nearly 1,800 heads, the epitome of thousands of judicial decisions, so arranged that the special circumstances of each case are set down as the reasons for such decisions. An appendix gives the laws regarding right of way, laws of the road, street-traffic regulations, headlight laws, speed limitations, registration, fees, etc., of all the states. The first edition was by the late C. J. Babbitt. This second edition was prepared by Arthur W. Blakemore, of the Massachusetts bar, who has added many decisions which have been handed down in the interim. The work shows thorough, careful and conscientious study in its preparation.

THE TIRE RATE BOOK. THE CLASS JOURNAL CO., NEW YORK City. Published in January, May and September of every year. [16vo, paper, 196 pages. Price, 50 cents a year.]

This convenient handbook for tire manufacturers, dealers and garage offices gives the sizes and prices of the different motor car tires in all their models. It also contains the pneumatic and solid tire schedules for the different cars and trucks; a standard telegraphic code for ordering; motor world guide; commercial and pleasure vehicle tire sizes and rim data; comparisons of average American cars for eight years; dealers, garages, supply, repair and charging stations in the United States; metric sizes and their equivalents; types of rims and statistics showing that there is a car for every 29 persons in the United States.

NEW TRADE PUBLICATIONS.

MOTHER GOOSE has certainly been brought up to the twentieth century in "The Kant Slip Mother Goose," published by the Kelly-Springfield Tire Co., New York City. This is gotten up in the usual child's story book style and contains some modern adaptations of well-known nursery rhymes, all of which result in encomiums for the tires manufactured by that company. The book is printed in two colors, bound in boards,

and is sent out by the advertising department of the company to any address on receipt of the price, 20 cents.

* * *

The Davol Rubber Co., Providence, Rhode Island, has sent us a copy of a large, handsome card containing a tri-colored picture of the American flag and three striking sentences from President Wilson's address to Congress on April 2. A copy of this card was given to every employe of the company recently and undoubtedly ornaments many homes in and around Providence.

* * *

The Seneca Tripoli Co., St. Louis, Missouri, is distributing a neat little pamphlet entitled "Tripoli Products," which gives many interesting general facts regarding the nature and uses of tripoli earth, besides describing the many forms and varieties of products manufactured by the company. The booklet is illustrated with half-tones of the quarries, mills and warehouses, and gives special attention to the filtration qualities of its stones, and the uses of its various grades of flour, among which may be mentioned its value as a filler in rubber compounding.

* * *

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, is sending out "Booklet E," a well-arranged and finely printed 32-page pamphlet describing the C-H control equipment for electric elevators. It covers the various classes of control, hand rope, car switch and push button systems for freight and passenger elevators. These various classes of equipment are fully illustrated by excellent half-tones, and much information is given regarding such accessories as limit switches, brakes, door safety switches, over-load protection devices, rules for motor rating, etc.

* * *

Two booklets, pocket size, of value to motorists, are "Rules of the Road" and "Common Causes of Tire Injury," which come from The B. F. Goodrich Co., Akron, Ohio. Both are well illustrated with cuts pertinent to the text, and much information is compressed into small compass. Every driver of a car will find these booklets practical and useful.

* * *

The customers of Pell & Dumont, 68 Broad street, New York City, dealer in crude rubber and gums, have received a serviceable binder for the daily market report sent out by this firm.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[300.] Information is sought regarding the rubber trade in the Fiji Islands.

[301.] Names of manufacturers of small mills for laboratory use are requested.

[302.] A correspondent desires to purchase sponge rubber and sponge rubber scrap in large quantities.

[303.] A list of factories manufacturing or handling tube poles has been requested.

[304.] An inquiry has been received for rubber elastic cords for airplanes.

[305.] Names are requested of concerns manufacturing rubber bath mats with vacuum cups.

[306.] Information is sought concerning the preparation of rubber varnish.

[307.] A correspondent desires to be put in touch with makers of dieing-out machines.

[308.] An inquiry has been received for stock cutters.

[309.] The name of a concern equipped for treating cotton duck with black oil is requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A business man from Denmark, now in the United States, desires to represent in Russia American manufacturers and exporters of tires, druggists' sundries, and other articles. Report No. 24,585.

Quotations on rubber are desired by an applicant in France. Report No. 24,589.

A firm in Uruguay is in the market for rubber heels. Report No. 24,603.

A company in India wishes to be placed in touch with American manufacturers and exporters of rubber goods. Report No. 24,625.

An agency or representation is desired by a firm in Italy for the sale of suspenders and rubber goods. Report No. 24,626.

A firm in France wishes to purchase one pump, adjustable accumulator and press of 800 tons, with all tubes, manometer, etc., and all necessary machinery for the manufacture of solid rubber tires for automobile trucks. Report No. 24,634.

A business man in the Straits Settlements is in the market for machinery for manufacturing rubber sheeting, tubes, heels, soles, etc. Report No. 24,735.

An applicant in British East Africa is in the market for erasers. Report No. 24,696.

A firm in France would like to be placed in communication with American manufacturers and exporters of reclaimed rubber. Report No. 24,712.

An applicant in Norway desires to purchase 20 tons of rubber for fish tins. Report No. 24,721.

An agency for erasers, rubber bands, etc., is desired by a man in Norway. Report No. 24,724.

THE OBITUARY RECORD.

VERSED IN RUBBER CHEMISTRY.

THE INDIA RUBBER WORLD is informed of the death of Lyman M. Bourne, subsequent to an operation for goiter. Mr. Bourne was well known to rubber men, having been active in the

LYMAN M. BOURNE.

industry ever since his graduation from the Massachusetts Institute of Technology in 1903. His first position was as research assistant in the laboratory of the late Carl Otto Weber in Boston. On the death of Dr. Weber he entered the employ of the Revere Rubber Co., Chelsea, Massachusetts, as chief chemist and remained there until called to Brooklyn, New York, to assume the superintendency of the Eastern Reclaimed Rubber Co. In 1909 he went to The Good-year Tire & Rubber Co., Akron, Ohio, where he held the position of chief chemist and department manager for five years, resigning in 1914 to become general manager of the Double Fabric Tire Co., of Auburn, Indiana, and leaving there to become vice-president of the By-Products Realization Co., Chicago, Illinois.

THE JUDGE'S CHARGE IN THE BLITZ CONSPIRACY SUIT.

ANNOU NCEMENT was made in THE INDIA RUBBER WORLD, June 1, 1917, of the decision in favor of the defendants in the case of Ludwig Blit v. The Rubber Central Committee of The Rubber Association of America. The charge of Supreme Court Justice Cropsey is of such interest, however, because of its clarity, that we publish it in full herewith.

After the customary explanatory remarks and congratulations to the plaintiff and defendants, Judge Cropsey said:

The claim of the plaintiff, in a general sense, is this: That these defendants conspired together unlawfully and wrongfully to put the plaintiff out of business, either wholly or in part. That is the claim stated in a few words.

The law of conspiracy is this, so far as it is necessary to apply it, particularly in this trial: A conspiracy necessarily means that two or more people are involved in it, because no one person can conspire with himself. The word itself indicates that there is some gathering together of some interests, more than one. So two or more people may conspire. If it is to be a conspiracy which may be the basis of any action, for instance, such as claimed in this case, the conspiracy would have to be to do something that was unlawful or to do something by unlawful means. But I need not go any further, I think, in the definition of the statement of the law, because of the very frank and fair concession of defendants' counsel, who said to you that if you found that these defendants, or any of them, conspired together wrongfully and unlawfully to put this plaintiff out of business or to injure him in his business, that then the plaintiff would be entitled to a verdict. That is fairly and frankly said, and that is the law anyhow. So I will not go any further into the discussion of the law on that phase of it.

I will try to point out to you now wherein the plaintiff claims the defendants did act wrongfully and unlawfully, and then leave it to you to say whether or not that is so.

Before I do that, however, let me say this to you: It appears in proof here that this plaintiff has not gotten, at least through the channels that he usually got it, import rubber since some time in May or June, 1915. But let me caution you, please, that when you go out to deliberate you try not to arrive at a result merely from that particular fact. Because that fact of itself does not establish anything that is of real vitality to this case. In other words, the mere fact that he has not gotten rubber does not show, unless you know something more, whether these defendants were wrongfully and unlawfully responsible for his failure to get it. So do not go out and just say, "Well, he did not get it, and therefore he ought to have a verdict." That would not be the law. That is the reason I am saying that to you.

I think it is conceded by the defendants, but whether it is or not, I think there is very little dispute about it, if any, that he has not been able to get any rubber; but the defendants very strenuously and seriously and earnestly dispute that they were in any way responsible for this failure. That is the reason I have pointed out to you that the mere fact that he has not got it is not to serve any purpose at all except just the one, namely, that he did not get it. You are going to find out why he did not get it, and see whether or not these defendants are responsible for it.

The plaintiff claims these several things as the basis of his action. You understand that I am only stating his claim. I am not stating anything that I think is true or the fact, but I am only going to state both claims, that is all. The plaintiff claims that the defendants wrongfully and unlawfully conspired together to get control of the rubber trade; that in pursuance of that conspiracy they promulgated rules or regulations, and prescribed that everybody would have to comply with those rules and regulations who wanted to get import rubber, import rubber at least from the British domains; that they also notified the trade that those who did not comply with these rules and regulations would not be permitted to get such import rubber, and could not do business in that line of trade. The plaintiff also claims that the defendants falsely accused the plaintiff of a non-compliance with their rules and regulations, that they delayed him in getting some of his shipments through, and that finally they refused to permit or to release other shipments, or permit him to get other shipments through.

I think, while that is stated rather summarily, that this statement covers at least in the main the claims that the plaintiff makes.

The defendants say that they did not do any of these things at all that the plaintiff claims against them. The defendants say

that they did not conspire to control the rubber trade; but, on the contrary, they were trying to foster the rubber trade, to encourage it, to help it do business; and the only way they could do that was to try to get everybody to live up to the regulations so as to minimize the possibility of the British Government absolutely cutting off the supply of crude rubber in this country. You understand that I am stating the defendants' claim. The defendants say that while they may have adopted some minor rules and regulations that the rules and regulations which were adopted and of which the plaintiff complains in his complaint were promulgated and enforced by the British authorities and not by these defendants at all; that they may have been merely the vehicle, if you please, through which they were sent out or made known to the trade; but that they were not the factors in prescribing what they should be. The defendants say that they did not falsely accuse this plaintiff of anything, that they never accused him of anything, either falsely or otherwise; that they did not delay any of his shipments; and that they never did anything that in any way prevented him from getting his shipments through; but that whatever delay there was in the last orders, and whatever prevention there was finally, was due solely to the acts of the British Consul, or his representatives, and not through any acts of these defendants.

I have, I think, generally stated the claims of the defendants. I do not mean, when I have tried to state briefly, as I have, the claims of both sides, I do not mean to exclude anything else. If there are other claims, I do not want to exclude them. That is not my purpose. My object is merely to try to simplify this case if I can for your determination—not that you could not handle it anyhow, but merely to make your labors easier, if I can point out the real issues that are said to exist, so you may give towards your verdict your thought and attention and ultimately decide which side to give your verdict to.

These are the claims of the two sides. There is a little more of amplification, I could perhaps say, about each of these. I will try merely to amplify them a little, without intending to express the slightest opinion one way or the other about the two sides of each of these claims, except in so far as perhaps the evidence may be uncontradicted concerning it. If it is, perhaps I will mention it.

The first thing is whether the defendants conspired to control the rubber trade, or whether they did not. The defendants have told you what they were trying to do, and why they were trying to do it.

It is a fact, apparently conceded, and even if it is not conceded, I think it is a fact anyhow, that there were misstatements made in some of these circular letters that these defendants sent out. Whether they were of importance or not, I am not saying. But the plaintiff claims that there were misstatements of facts in these circular letters. Perhaps the principal claim he makes is the one which said that the Rubber Club of America was the trustee of the British Government, in reference to this rubber matter, and that they had *carte blanche* practically to carry the whole thing through; and some other charges of that kind. I think it is conceded that these statements were at least inaccurate. They were not truthful. But does it matter? I do not mean by that question to say I think it does not matter either. I only want you to get the real purport of these things. Is it important whether those were true or not? If it is important, then you will have to find out why it is important. If it is not important, you will pay just as little attention to it as its lack of importance justifies. Is it important with you, these false statements? Their purpose and intent in doing that, of course, would have a bearing in deciding whether or not it was an important thing in this case.

As I understand the claim of the plaintiff it is that the defendants is that while these statements were untrue, that they to get control of the rubber trade, and get it into their own hands, so that they could do as they liked about it.

On the other hand, as I understand it, the claim of the defendants is that while these statements were untrue, that they were made with the idea rather of not getting any advantage over anybody, but trying to impress the trade with the belief that they really had to do what these regulations prescribed in order to protect everybody in the trade against the possibility of a calamity almost, it might be said, of having this rubber supply entirely cut off by the British Government.

I think that is, in a word, the two claims on that point.

What do you think is the fact about it?

If course, if the latter claim is true, if that is the only reason that they did it, then the false statements are not of any real moment. If they did it for the other purpose, it may be of some moment. But, of course, if it is, even then it would not establish the plaintiff's main claim, but it would be a factor to be considered in connection with the other proof.

I think it is undisputed in the case that these defendants did not prescribe the main rules, or what I call the main rules. I mean the rules in regard to the necessity for the written guarantees of both the importer and manufacturer. I think it is admitted, or even if it is not admitted, I think it is undisputed, that these defendants did not prescribe those rules and regulations. Those were prescribed by the British authorities in London, as the uncontradicted proof in this case shows. So as to that part of it, at least, there can be no criticism of these defendants. As to how they may have attempted to enforce them, we will come to a little later. But as to the whole formation or creation and promulgation of these rules, I think the defendants had no part under the undisputed proof.

With the promulgation of these rules, the plaintiff claims that the defendants practically told the people that if they did not comply with the rules, they could not get import rubber. They did tell them that. I think the undisputed proof in the case bears out that statement, because the British authorities said that if they would not comply with these rules, you cannot get rubber, and therefore anybody who did not comply with these rules, would not get it.

You cannot predicate any charge against the defendants on that statement, because the statement that they made to that effect seems to have been required by the regulations of the British Government.

Then the plaintiff claims that these defendants falsely accused the plaintiff of a non-compliance with some of the regulations. I do not get clearly at all the point the plaintiff bases that claim on—that they falsely accused the plaintiff of non-compliance. As I get it, the claim of the plaintiff is that when he went in there, and there was some discussion about whether he had complied with these regulations, that he made his claim that he had complied with them as he understood them. That is how I understand the plaintiff's claim. I do not understand that he says that the defendants in any way accused him of violating the rules. I mean not at the time preliminary to this trial. But if there is any such claim, of course, you can consider it, because that is one of the charges that the plaintiff makes in his complaint upon which this cause of action arises.

The plaintiff also says that the defendants delayed putting through his shipments, and finally ultimately refused to pass any more. About that, there is no dispute that he could not get any more through. I say that perhaps rather unreservedly and unqualifiedly, notwithstanding Mr. Vorhis' testimony or demeanor, rather, that may have been a little uncertain about it. But I understand the defendants do not dispute really that they did not put any more of these things through. If there is any dispute about that, I will hear counsel, and he can take an exception. I do not intend to be unfair in the statement. I am only trying to simplify it and get it down to what I think there is really a dispute about. I do not understand that there is any real substantial dispute about the fact that the plaintiff could not get any more of his import rubber through, and that there was some delay. How much, I do not know. Whether it is important or not may not appear either; but that there was some delay in getting through his last three shipments, I think there is no dispute about. Whether it is important or not, I do not say.

The question on these last two considerations is this: Was the delay, whatever it amounted to, and was the final situation which now prevents the plaintiff from getting any import rubber from British domains, in any way due to the wrongful and unlawful acts of these defendants? I want to emphasize those two adjectives, "wrongful" and "unlawful," because it has to be acts of that kind and character, and you have got to find that there were acts of that kind and character before under any possibility this plaintiff is entitled to a verdict. To put it in another way: If these defendants in good faith, without any wrong motive, without any harmful intent or purpose, if they did something or said something or failed to do something which in any way had the effect of cutting off the plaintiff, even if they did that, there would be no liability, because the liability in this case is charged not upon an unintentional wrong, not upon something that happened which nobody sought to bring about; but it is charged upon a wilful, wrongful and unlawful attempt and undertaking to bring about the result that has been brought about. So you see that even if you find that these defendants had a part—and I do not assume you will find that these defendants had a part in bringing about the final result, that would not entitle the plaintiff to a verdict unless you found that that part which the defendants took was taken wilfully, deliberately, with the intention of putting this plaintiff out of business, or crippling him in his business.

Just to illustrate what I mean by that let me say this. There is some proof here, in fact, I think it is undisputed in the proof, that the British representative, Mr. Broderick, who said he put

the final embargo on this—that is not the best word to use, because that is mixed with the Government embargo—but who put the final veto on the right of this plaintiff to get any more crude rubber—he said that he never knew of the plaintiff's connection with this rubber on this "Atlantic" except as he got the information of it from the defendants acting through Mr. Wilson. I want you to, if you will, bear in mind what I have just stated before, and see how that fact of itself should be applied. The information upon which Mr. Broderick acted, he said he got through Mr. Wilson. But that does not show that this plaintiff has any cause of action, because if Mr. Wilson went to Mr. Broderick at the request of Mr. Blitz, and told him, Mr. Broderick, what Mr. Blitz had asked him should be told, why, of course, you would see in a moment without even my saying it that then there could not be any basis for a liability against the defendants predicated upon that fact. To go further. If Mr. Wilson went to Mr. Broderick not merely to tell what Mr. Blitz had asked him to tell; but if he went there with no wrong motive, if he went there without any unlawful purpose, without any wrongful intention of hurting Mr. Blitz at all, and told what he knew about Blitz's connection with the rubber on the "Atlantic"; and even though that was the cause of Mr. Broderick cutting off Mr. Blitz's supply, still that would be no basis of a liability, because you will bear in mind that the acts of the defendants for which they can be held liable are only those which were done wrongfully and unlawfully. If they have acted rightfully and if they have acted with a good motive, there is no possible liability. On the other hand, if they have even acted thoughtlessly or carelessly or even inconsiderately, there is no liability so long as their lack of caution or lack of consideration was not due to any wrongful, wilful, intentional desire to harm this plaintiff.

I hope I have made that clear, because that is the gist of the case. The decision in the case rests upon your determination of whether or not there was any wrongful or unlawful acts on the part of these defendants that helped to bring about this result. Any other act of the defendants that was not wrongful or unlawful is not an act upon which you can find a verdict for the plaintiff, even though it may have been the cause of producing the very unfortunate situation that the plaintiff now finds himself in.

I have tried to clarify just what the real issues are in this case. If I have done so, I am glad, because that ought to be and is the object of the Court in charging the jury.

Just let me say to you a few other things, that you will not misunderstand either. There has been some talk in this case about nationality. I observed, when there was the first mention of that in this case, that that had nothing to do with the case. I am only saying it to you, because I believe it is my duty under the law to say it to you, that if any verdict should be found in this, or any other case, either for or against a plaintiff or for or against a defendant because of his nationality, why it would be a disastrous situation and a result that would bring discredit alike upon the jurors who found it and upon the county that they represented. Nationality has no part in our courts of justice. We are proud of the fact that people can come into our courts and get justice, no matter who they are.

While I have said that, let me say this: That if you feel that anybody in this case has attempted to import into the case any question of nationality, and if you feel perhaps a not unnatural resentment that that has been done, let me say to you very earnestly to be very careful to see that if you have such resentment that it does not operate against the party who you think may have attempted to import that question into the case. You see that is just as important to do as the other thing I have suggested is to do. Both are important, in order that you will get the right result, a result that is not influenced by resentment, or prejudice, or passion, or consideration, or sympathy, or anything else; but a result which is determined simply and solely by the truth of the case as you find it in the witnesses and in the exhibits, and that which rings true to your consciences.

The question of whether or not this plaintiff intended, in buying this rubber for Kulenkampff, that it should be exported or that it might not be exported, that of itself may not be a determining factor in the case one way or the other. It may have a bearing on the case, of course, depending upon how you view it, but it may not be a determining factor.

These defendants do not claim that they failed or refused to do anything for this plaintiff because of his connection with the Kulenkampff affair. They contend that they did all they could notwithstanding his connection with it, no matter what it may have been; and that in all they did they tried to keep him in good favor or get him back in good favor with the British Government, not as I understand it, because of any altruistic motive altogether either, not because they were interested in Blitz, as I understand it, but from a very practical and, in a sense, humanly selfish motive, as I understand it, that they did not want to take

the chance of their getting in trouble too, and that if they got in trouble perhaps the British Government would begin to curtail the supply. I am only stating what I understand is the defendants' claim. So the defendants claim that anything they did was not because of any action of the plaintiff in regard to the Kulenkampf affair. That is the reason why I say that the mere fact whether the Kulenkampf affair was an honorable one or a dubious one or a dishonorable one may not of itself help to determine this controversy. It has a bearing in the case, because everything must be considered that is in evidence on the intent of the parties. It has a bearing certainly, or it may have, upon what ultimately was the reason why Mr. Blitz did not get any more rubber through the British Consul. In so far as it has those bearings, it is important. But I do not think the case turns one way or the other upon how you decide that question. But that is the reason I am pointing it out to you.

In this case, like every case, the plaintiff has to prove his case. That means just this. It means that now that the case is all in, the evidence and the exhibits all before you, that you have to be convinced, that you have to be satisfied, that the truth of the case establishes the fact that the plaintiff claims, namely, that these defendants wrongfully and unlawfully conspired to do him this grievous harm. If you are convinced of that, then the plaintiff has proven his case. If you are not convinced of that, then the plaintiff has not proven his case. If he has not proved his case, under the law, the verdict must be for the defendants. In other words, the defendants do not have to disprove the plaintiff's claim. The plaintiff has to prove his claim. Failing to do that to your satisfaction he loses. To put it in another way. If you do not know whether or not these defendants wrongfully and unlawfully conspired to do this injury to the plaintiff, if you do not know whether it is so or not, then you must find for the defendants, because the plaintiff has not convinced you that it is so. He has to convince you that it is so before he can succeed. If you are satisfied that the defendants did not conspire, then the verdict is for the defendants, because the plaintiff has not shown you that they did conspire. It is only in the one event that you are satisfied as a matter of truth and fact that the plaintiff has proven and that the evidence shows that the defendants have wrongfully and unlawfully conspired to do this harm to this plaintiff, that you may find for the plaintiff.

There have been a number of interested witnesses in this case. Under the law the plaintiff is an interested witness. Each defendant is an interested witness. The plaintiff is interested because he is trying to get money. The defendants are interested because they are trying to defeat a claim of money sought to be obtained from them. So the law recognizes all of them as interested witnesses, and says merely this about them. The law does not say you must not believe them. A great many years ago they were not allowed to testify at all, because somebody apparently had the idea that interested people never told the truth. You are all business men, and you know that is not the fact always. You know that interested people sometimes do tell the truth, even though it hurts their interests. On the other hand, you know perfectly well that sometimes interested people do not tell the truth; that when it serves their purpose to exaggerate or color, or do even worse, they sometimes do it. The law recognizes all that, and says just this about interested witnesses, that you should take their testimony with care and caution and look at it carefully before you tie up to it. Before you are satisfied that you can rely on it, be sure that you believe it is true. If you do believe it is true, believe it, notwithstanding they have an interest. If you do not believe it is true, discard it. That, of course, you would do anyhow with other witnesses as well as those interested witnesses I have referred to.

The verdict in this case will be either for the plaintiff or for the defendants. If it is for the defendants, there is nothing more to the verdict and nothing more for you to deliberate upon. But if you find, under the rules I have given you, that the verdict should be for the plaintiff, then you will have to decide two other things. One is against which of the defendants the verdict should be; and the second what the amount of it should be.

Gentlemen, I really feel almost embarrassed in stating some things here to you, because you are so intelligent, but I feel it is my duty to say this. You will understand the fact that I am going to charge you about the question of damages does not indicate that I think you will ever get to that question at all. I have to charge you about it, because under the law I have to cover every possible question in the case before you retire. I cannot tell whether you are going to find for the plaintiff or for the defendants. So do not be misled by the fact that I am going to charge on the question of damages. You will not get to the question of damages if you find for the defendants. But if you find for the plaintiff, then you come to the question of damages, and the determination of which of the defendants your verdict should be against.

On the latter question this is the law: If there is a conspiracy, as I have already told you, there must be at least two to take part in it, and there may be more. The plaintiff claims that all these defendants who have been named here conspired together, that they were all of this committee, and whatever was done by one was done by all; that the circulars that went out bore the names of all—perhaps not every one, but most of them did at any rate; and that they were acting in concert and acting through their chairman, and that their secretary, Vorhis, was acting in behalf of them all and representing them all.

If you find that there was any conspiracy, and that they all participated in it, and that it was a conspiracy of the kind I have indicated to you, an unlawful, wrongful combination to squeeze this plaintiff, then your verdict may be against all of them. If you find any one or more of them did not enter into that conspiracy, your verdict could only be against those whom you think did enter into it.

There does not have to be direct proof of conspiracy. I suppose it is almost impossible in any law suit to get the concrete proof that two or more people got together and said, "We are going to conspire to do this thing." It is not done that way, as a rule, at least. The law recognizes that fact, and says that you may (I do not say that you will or should) in proper cases find that there was a conspiracy from the acts and from the things that you might prove to have been done to you from the concert if there be such between the parties. So if you find a verdict for the plaintiff, and get to that question, just say whether or not in your verdict it is against all the defendants, or if not name those against whom you find.

Then on the question of damages the law is very simply stated. If the plaintiff is entitled to recover, he is entitled to recover whatever damages he sustained as the result of these wrongful and unlawful acts of the defendants, because you have got to find that they were wrongful and unlawful before you find for the plaintiff at all. If they did these wrongful and unlawful things, they must pay the plaintiff for the damage that resulted. That you will fix, using not necessarily as the mathematical basis of your verdict the proof as to what his earnings have been before and since, but using that proof together with any other proof there may be in the case in determining what really has been the damage occasioned to him by these acts of these defendants.

PERLMAN-FIRESTONE SUIT DISMISSED.

AFTER five days of legal skirmishing before Judge Learned Hand in the United States District Court of New York the infringement suit of the Perlman Rim Corporation, of New York City, against the Firestone Tire & Rubber Co., Akron, Ohio, was brought to a dramatic close through its sudden withdrawal by the attorneys for the rim corporation, and its final dismissal without prejudice to either side by the Court. This was followed later by the announcement of L. H. Perlman's removal from the presidency of the company bearing his name because of his complete lapse of memory while on the stand regarding his London business career of 1895, and his refusal to answer questions or to affirm or deny allegations reflecting upon his integrity.

Although this surprising denouement constituted a signal victory for the Firestone Company, the Perlman patent continues technically a valid grant. However, the significance of the present situation lies in the fact that the historic suit against the Standard Welding Co., authenticating the Perlman patent, was won principally because of the Court's belief in Mr. Perlman's rectitude and veracity, and the acceptance of his testimony, supported by witnesses, as to the manner and date of the mental conception of his invention. Should the validity of the patent again be tested at law it is an open question what weight his testimony would carry.

According to "Automobile Topics," "it is believed that Perlman's unexpected elimination from the Perlman company will render it possible for those in control of its affairs to readjust relations with the trade, thereby aiding in bringing to an end the tense uncertainty that has remained ever since the rim industry was held up by the now historic decision by the old Standard Welding Co."

It was in February, 1916, that the Perlman patent was sustained in a suit against the Standard Welding Co. Up to that time anyone had made demountable rims without restrictions, the Firestone company, for instance, having been making them since 1908. The Perlman patent, not issued until 1913, was made operative by Perlman swearing that his invention dated back to 1903.

Thus Perlman had a practical monopoly on all forms of demountable rims. The factory of the Standard Welding Co. was closed and all rim manufacturers notified to discontinue making rims. Then the Perlman Rim Corporation was organized with a capital of \$10,000,000, and it was understood that Perlman received between \$3,000,000 and \$4,000,000 for his invention.

The entire automobile industry was disturbed and its output seriously threatened. Automobile manufacturers who had been receiving their rims from the Standard Welding Co. made arrangements with the Perlman Rim Corporation to release a sufficient number to maintain their deliveries, and most of the other rim manufacturers submitted and turned their plants over to the Perlman Rim Corporation.

Being firmly convinced that this patent was unjust and a serious menace to the entire motoring public, H. S. Firestone refused to recognize the Perlman claims in any way. Braving an injunction against his firm and the closing of his rim plant, he decided to fight the matter out in the courts and took personal charge of the case for his company. The injunction was first argued in New York before Judge Mayer on April 13 last. By that time the Firestone attorneys had gathered new evidence showing the character of the testimony on which the decision in the former suit had been obtained and asked that they be given an opportunity to present the facts in open court. On this showing, an injunction was denied and the present suit was set for a hearing.

The Firestone company is still manufacturing rims untrammelled by any patent claims, and Mr. Firestone believes everybody is now put on an equal footing again where merit and efficiency are the measures by which all will be judged.

JUDICIAL DECISIONS.

ROUTES FOR RUBBER SHIPMENTS.

AN important decision was rendered in the Court of Appeals London, in a rubber contract case regarding routes for rubber shipments.

L. Sutro & Co., London, England, bought a quantity of rubber under a contract (c. i. f.) from Heilbut, Symons & Co., London, England. The sellers had the goods shipped to Seattle, whence they were to be reshipped by rail to their destination, New York City. To this the buyers objected and demanded arbitration to settle the matter. When their objection was overruled, they appealed to the Committee of the Rubber Trade Association and by a second decision in a special case, it was held that the buyers were not liable to accept delivery. From this decision the sellers now appealed, claiming that the route by which they had sent the rubber had become a usual one, that it could be read into the contract and that they, therefore, had the right to use it instead of the route wholly by sea.

It was held, however, that the terms of the contract, referring constantly to "vessel or vessels" and to "the port of discharge," provided for carriage by sea only, and that consequently, although it had become the custom to ship goods from the East to Seattle and then transmit them by rail to New York City, the terms of the contract could not be construed to include this custom. The appeal by the sellers was, therefore, dismissed with costs.

DELASKEI & THROPP CIRCULAR WOVEN TIRE CO. v. EMPIRE RUBBER & TIRE CO., in District Court, New Jersey, December 12-16. In a suit for infringement by the manufacture and sale of

infringing machines, an interlocutory decree was entered in favor of complainant, but limiting the accounting and extent of complainant's recovery to the profits which defendant had derived from the infringement. On affirmance of such decree the parties made a settlement and entered into a stipulation that the amount paid by defendant was accepted by complainant in full payment of all claims and demands which it may have against the defendant by reason of the defendant's infringement.

Held, that the settlement covered only infringements of the character charged in the bill and such damages and profits as could have been recovered under the issues in the cause and that it did not bar a subsequent suit by complainant against a user of machines sold by defendant although bought before it was made. [Federal Reporter, Vol. 239, page 139.]

FOLEY v. HOME RUBBER CO. New Jersey Supreme Court. A sales representative of a manufacturing company who became one of the Lusitania victims, while on his way to Europe on business for his company, must be regarded as having lost his life in an accident in the course of his employment, within the provisions of the New Jersey workmen's compensation act, entitling his widow to an award under that law. [Atlantic Reporter, Vol. 99, page 624.]

WENDELL v. AMERICAN LAUNDRY MACHINERY CO., United States District Court, Eastern District of Pennsylvania. Public use of a machine with permission of the inventor for two years before his application for a patent conclusively establishes his abandonment of any right to a patent, unless it appears that such use was for experimental purposes only. [Federal Reporter, Vol. 239, page 555.]

INTERESTING LETTERS FROM OUR READERS.

SINGAPORE CELEBRATES AMERICAN WAR PARTICIPATION.

To the Editor of THE INDIA RUBBER WORLD:

DEAR SIR—The weekly rubber auction was suspended for an hour yesterday to enable those present to attend the Anglo-American war participation services which were quite impressive, the address being delivered by an American Episcopal archdeacon, as per enclosed clipping and two postcards, showing St. Andrew's Cathedral and statue of Sir Stamford Raffles, the founder of Singapore.

Singapore, April 27, 1917.

RICHARD WEIL.

DO RUBBER SOLES AND HEELS PROTECT ARTILLERYMEN?

To the Editor of THE INDIA RUBBER WORLD:

DEAR SIR—In the "Red Cross Magazine" for July, page 249, G. F. Keogh, an ambulance man with the Red Cross in France, describes how heavy artillery gunners use plugs of cotton in their ears and rise on their toes during the firing to prevent rupture of the ear drums.

Can you advise a reader of THE INDIA RUBBER WORLD to what extent, if any, a good rubber heel and sole will prevent or ease the concussion?

CHAS. P. FOX.

Cleveland, Ohio, June 20, 1917.

AKRON-BOSTON EXPRESS.

The present railroad congestion has greatly increased the transportation of freight by motor trucks for distances up to 75 miles or more. A route covering a distance of 1,540 miles, maintaining regular schedules night and day, is therefore an interesting development of motor truck possibilities. The Goodyear Tire & Rubber Co. has inaugurated this new service by the establishment of a line operating between its factory at Akron, Ohio, and Boston, Massachusetts, hauling tires to its eastern branches, and returning laden with cotton fabric from the Goodyear Cotton Mills, at Goodyear, Connecticut. Several round trips have already been made, the last of which was accomplished in seven and one-half days.

The Rubber Association of America.

THE Association continues to broaden in scope and usefulness. The beneficial influence of this organization on present trade conditions is noteworthy. New divisions are being formed and the membership roll is constantly increasing.

At a meeting of the Executive Committee held May 31 in the Association rooms, the following firm members were elected:

FIRM MEMBERS

Albert E. Burr, Albert E. Burr Co., New York City; J. Pines, Pines Rubber Co., Inc., Brooklyn, New York; S. L. Warner, The National Tire & Rubber Co., East Palestine, Ohio; J. A. Duval, F. S. Carr Co., Framingham, Massachusetts.

TRANSFERS FROM ASSOCIATE TO FIRM MEMBERSHIP.

E. L. McGreen, Standard Underground Cable Co., Pittsburgh, Pennsylvania; O. A. Barnard, The O. A. Barnard Co., Inc., New York City.

RUBBER RECLAIMERS' DIVISION.

The Rubber Reclaimers Division has succeeded the Rubber Reclaimers Club, founded by William T. Rodenbach, March 28, 1900, and promises to be one of the most active divisions of the Association. A mid-summer meeting will be held July 24, at the Copley Plaza, Boston, Massachusetts, followed by a shore dinner at the Point Shirley Club, Winthrop, Massachusetts.

An important meeting was held June 12 and resulted in the adoption of the following standard specifications relating to rubber scrap, effected July 1, 1917.

STANDARDS OF SCRAP RUBBER SPECIFICATIONS AND PACKING.

All goods bought or sold under the following specifications are understood to consist only of Domestic or Canadian manufacture, unless otherwise stipulated. All grades of scrap rubber shall be bought and paid for net weight, mill weights to govern, and no allowance for bagging or covering of any kind shall be made, nor shall the same be returned to the seller.

All shipments of scrap rubber must be contained in bags, bales, bundles, or other suitable containers, and if shipped loose a charge of ¼ cent per pound shall be made for extra handling, except automobile tires and railroad hose which may be shipped loose.

DELIVERY.

A. A ton shall mean 2,000 pounds, unless otherwise specified. In relation to Foreign Scrap Rubber a ton shall mean 2,240 pounds. Shipments less than a ton shall be accepted at ¼ cent per pound reduction.

B. Should buyer claim that goods delivered on a contract are not up to the proper standard and the seller claim that they are a proper delivery the matter shall be referred to the Arbitration Committee of The Rubber Association of America, Inc., who shall appoint an equal number of claimants and deciders, who in turn shall select an umpire.

C.—All scrap rubber of foreign manufacture shall be bought C.I.F. port of entry as per weight determined by sworn weigher's certificate, seller to bear expense of weighing, and shall be subject to same conditions as govern purchases of domestic manufacture.

D.—REJECTIONS: Upon his request all rejections shall be returnable to the seller within thirty days from the time notice of rejection is received by him and upon payment by him of ½ cent per pound to cover cost of sorting and rebaling. If shipping instructions are not furnished within the above mentioned thirty days the purchaser shall be at liberty to make such disposition of the material as he may see fit. The above does not apply if rejected material is purchased by the mill.

E.—Each grade of scrap rubber must be packed separately, and if not so packed a handling charge of ½ cent per pound will be made by the buyer.

F.—All scrap rubber must be dry and free from dirt. All scrap received wet may be dried by the buyer, such shipments to be paid for on the dry weight as ascertained at the mill.

G.—A purchase contract shall not be considered filled until the full quantity within 2½ per cent more or less net weight shall have been received, any rejections to be replaced within thirty days of the date of notice of rejection to the shipper.

H.—If through embargo a delivery cannot be made at the time specified the contract shall remain valid and shall be completed immediately on the lifting of the embargo, and terms of said contract shall not be changed. Notice of embargo must be served by seller.

Code words appear in italics.

1. RUBBER BOOTS AND SHOES (*Acres*). The deliveries of rubber boots and shoes must consist of rubber boots and shoes of domestic or Canadian manufacture. Red, white, tan, and fancy colored shoes are not a good delivery. They must be dry and free from dirt. All cloth top shoes, trimmed or untrimmed, and soles or heels of rubber boots and shoes from which the uppers have been removed shall not be accepted as a good delivery.

2. TRIMMED ARCTICS (*Bonito*). Must be closely trimmed and free from leather or any composite non-rubber bearing material such as fiber inner soles, etc.

(a) UNTRIMMED ARCTICS. Must be free from leather or any composite non-rubber bearing material such as fiber inner soles, etc.

3. TRIMMED TENNIS SHOES (*Clam*). Must be black; closely trimmed; free from molded soles and leather, or any composite non-rubber bearing material such as fiber inner soles, etc.

(a) UNTRIMMED TENNIS SHOES. Must be free from leather and molded soles, or any composite non-rubber bearing material such as fiber inner soles, etc.

4. STANDARD AUTO TIRES (*Dick*). Must be free from the following: All unguaranteed tires; heavy beaded tires; non-pneumatic or filled tires. Must not contain any hard, oxidized, burnt, single tube, motor cycle, stripped or badly worn tires nor tires containing leather or metal.

5. UNGUARANTEED TIRES (*Earl*). Must be free from heavy beaded tires, hard or oxidized, stripped, badly worn tires with leather and metal.

6. HEAVY BEADED TIRES (*Farm*). Must be free from hard or oxidized tires, stripped, badly worn and tires with leather and metal.

7. BADLY WORN TIRES (*Game*). Must be free from hard or oxidized tires, heavy beaded and tires with leather and iron. A reasonable proportion of the tread must be on the tires.

(a) STRIPPED TIRES. Must be free from hard or oxidized tires, heavy beaded and tires with leather and iron.

8. NO. 1. AUTO TIRE PEELINGS (*Hawk*). Must be free from cloth, metal and leather.

9. NO. 2. AUTO TIRE PEELINGS (*Iced*). Must consist of peelings from auto tire treads only and must be free from metal, leather and stripped auto tire fabric.

10. BICYCLE TIRES (*Jade*). Must be free from hard or oxidized tires, wire and beaded tires.

11. SOLID WAGON AND CAB TIRES (*Kite*). Must be free from metal and baby carriage tires.

12. SOLID MOTOR TRUCK TIRES (*Lamb*). Tires must be over 2½ inches in diameter. Must be free from metal and tires with hard bases, fiber bases and cloth bases.

13. AIRBRAKE HOSE (*Mask*). Must be free from metal, hard or oxidized hose and steam hose.

14. GARDEN HOSE (*Nail*). Must be ½ inch, or over in diameter and free from metal, rags, rope and cotton covered hose.

15. LARGE HOSE (*Oven*). Large hose must be one inch or over in diameter. Must be free from metal, rags, rope, hard or oxidized hose and all cotton covered hose.

16. COTTON COVERED FIRE HOSE (*Park*). Must be rubber lined, and free from hard or oxidized hose, double jacketed and extra heavy single jacketed hose, and metal.

17. NO. 1. AUTO INNER TUBES (*Quiz*). Must be strictly elastic floating tubes, free from crusty tubes, cloth, metal, patches and valve seats.

18. NO. 2. AUTO INNER TUBES (*Race*). (Known as Compounded Tubes.) Must be standard tubes, free from crusty tubes, cloth and metal.

19. NO. 1. BICYCLE INNER TUBES (*Salt*). Must be strictly elastic floating tubes, free from crusty tubes, cloth, metal and valve seats.

20. NO. 2. BICYCLE INNER TUBES (*Train*). (Known as Compounded Inner Tubes.) Must be standard tubes, free from crusty tubes, cloth and metal.

21. RED AUTO INNER TUBES (*Utes*). Must be standard tubes, free from punchings, crusty tubes, cloth, metal and black patches.

(a) WHITE AUTO INNER TUBES. Must be standard tubes, free from crusty tubes, cloth, hard metal, and patches other than white.

(b) WHITE BICYCLE INNER TUBES. Must be standard tubes, free from crusty tubes, cloth, hard metal, and patches other than white.

22. NO. 1. WHITE RUBBER (*Fisc*). Must consist of strictly clean white soft druggists' sundries and must be free from cloth and metal.

23. NO. 2. WHITE RUBBER (*Hard*). Must consist of white horse shoe pads, white toys, white mechanical goods, and to be free from cloth, metal, crusty, hard or oxidized material.

24. NO. 3. WHITE RUBBER (*Hare*). Must consist of painted white rubber balls or toys from which the paint has been removed, and to be free from cloth, painted wa'scoting, metal and hard or oxidized rubber.

NO. 4. WHITE RUBBER. Must consist of white jar rings and be free from cloth, metal and hard or oxidized rubber.

25. WHITE WRINGER RUBBER (*Wren*). Must be strictly white soft rubber, free from yellow wringer rubber, hard or oxidized wringer rubber, cloth and metal.

26. YELLOW WRINGER RUBBER (*Gray*). Must be free from cloth, metal and hard rubber.

27. MIXED BLACK RUBBER (*Yoke*). Must be free from cloth, metal, crusty, hard or oxidized material, packing, stripped matting, tiling, baby carriage tires and molded soles.

28. MATTING AND PACKING (*Zero*). Must be free from Garlock, Crandall, and piston packing, belting and similar material, metal and hard or oxidized stock.

29. NO. 1. RED RUBBER (*Yeast*). Must consist of soft red druggists' sundries, free from maroon, chocolate, and other dark shades, also free from cloth and metal.

30. NO. 2. RED RUBBER (*Yawl*). Must consist of material such as red toys, balls, mechanical red. Must be free from jar rings, soles, packing, hard or oxidized rubber, cloth and metal.

31. RED PACKING (*Yard*). Must be free from hard or oxidized rubber, cloth and metal, and discolored rubber.

UNITED STATES RUBBER CO. MAKES ARTIFICIAL LEATHER GOODS.

Artificial leather is a new development of the rubber business and is being much used for high-grade automobile-topping and in imitation of leather articles of all kinds, such as traveling bags, furniture upholstery, and similar articles. The United States Rubber Co. is now manufacturing and placing traveling bags on the market, but has thus far been unable to meet the demand and is planning to enlarge this department.

At the Naugatuck, Connecticut, plant of the Goodyear's Metallic Rubber Shoe Co. a new rubber fabrics department has been started in the "Old Shop" on Rubber avenue. The present capacity of the auto-topping department is 5,000 yards a day, but this will shortly be doubled and the output will, eventually, be 20,000 yards per day.

In conjunction with this department, it is planned to have the rubberized carriage cloth and artificial leather plant, which is now operated in Malden, Massachusetts, moved to Naugatuck, where it will be developed until it has a capacity of 10,000 yards a day.

It is expected that the new rubber fabrics department will require from 150 to 200 operatives in the near future. It will be under the management of James W. Quirk, who has had extensive experience at the National India Rubber Co., Bristol, Rhode Island; the Canadian Consolidated Rubber Co., Limited, Montreal, and the Boston Rubber Shoe Co., Boston, Massachusetts.

RUBBER MEN DISCUSS EXPORT TRADE.

IN connection with the industrial trade exposition held June 23 to 30, at Springfield, Massachusetts, an export conference was instituted as a prominent feature, and this brought together many men now exporting, and others who are considering the broadening of their business, by securing foreign trade. On the opening day, Edwin F. Sweet, assistant secretary of the Department of Commerce, was the principal speaker. The conferences from Monday to Saturday were confined to special subjects, or lines of merchandise, and on each day a number of leading men in the chosen industries addressed the meetings. Wednesday, June 27, was denominated "Leather and Rubber Goods Day," and the rubber industry was represented by E. H. Huxley, president of the United States Rubber Export Co., Limited, New York City, and J. B. Maus, export manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts.

PRACTICAL ADVANTAGES OF AN EXPORT BUSINESS.

Mr. Huxley delivered a carefully prepared address, showing the advantages of an export business to American manufacturers. Such business, he declared, because of its stability, offers a balance which becomes invaluable in times of domestic business depression. Foreign business is permanent and secure. Unlike the domestic buyer, the foreign customer is largely dependent on the seller, and if his goods are properly made, shipped promptly and exactly as specified, he will conceive a loyalty and trust in the seller hard to overcome.
